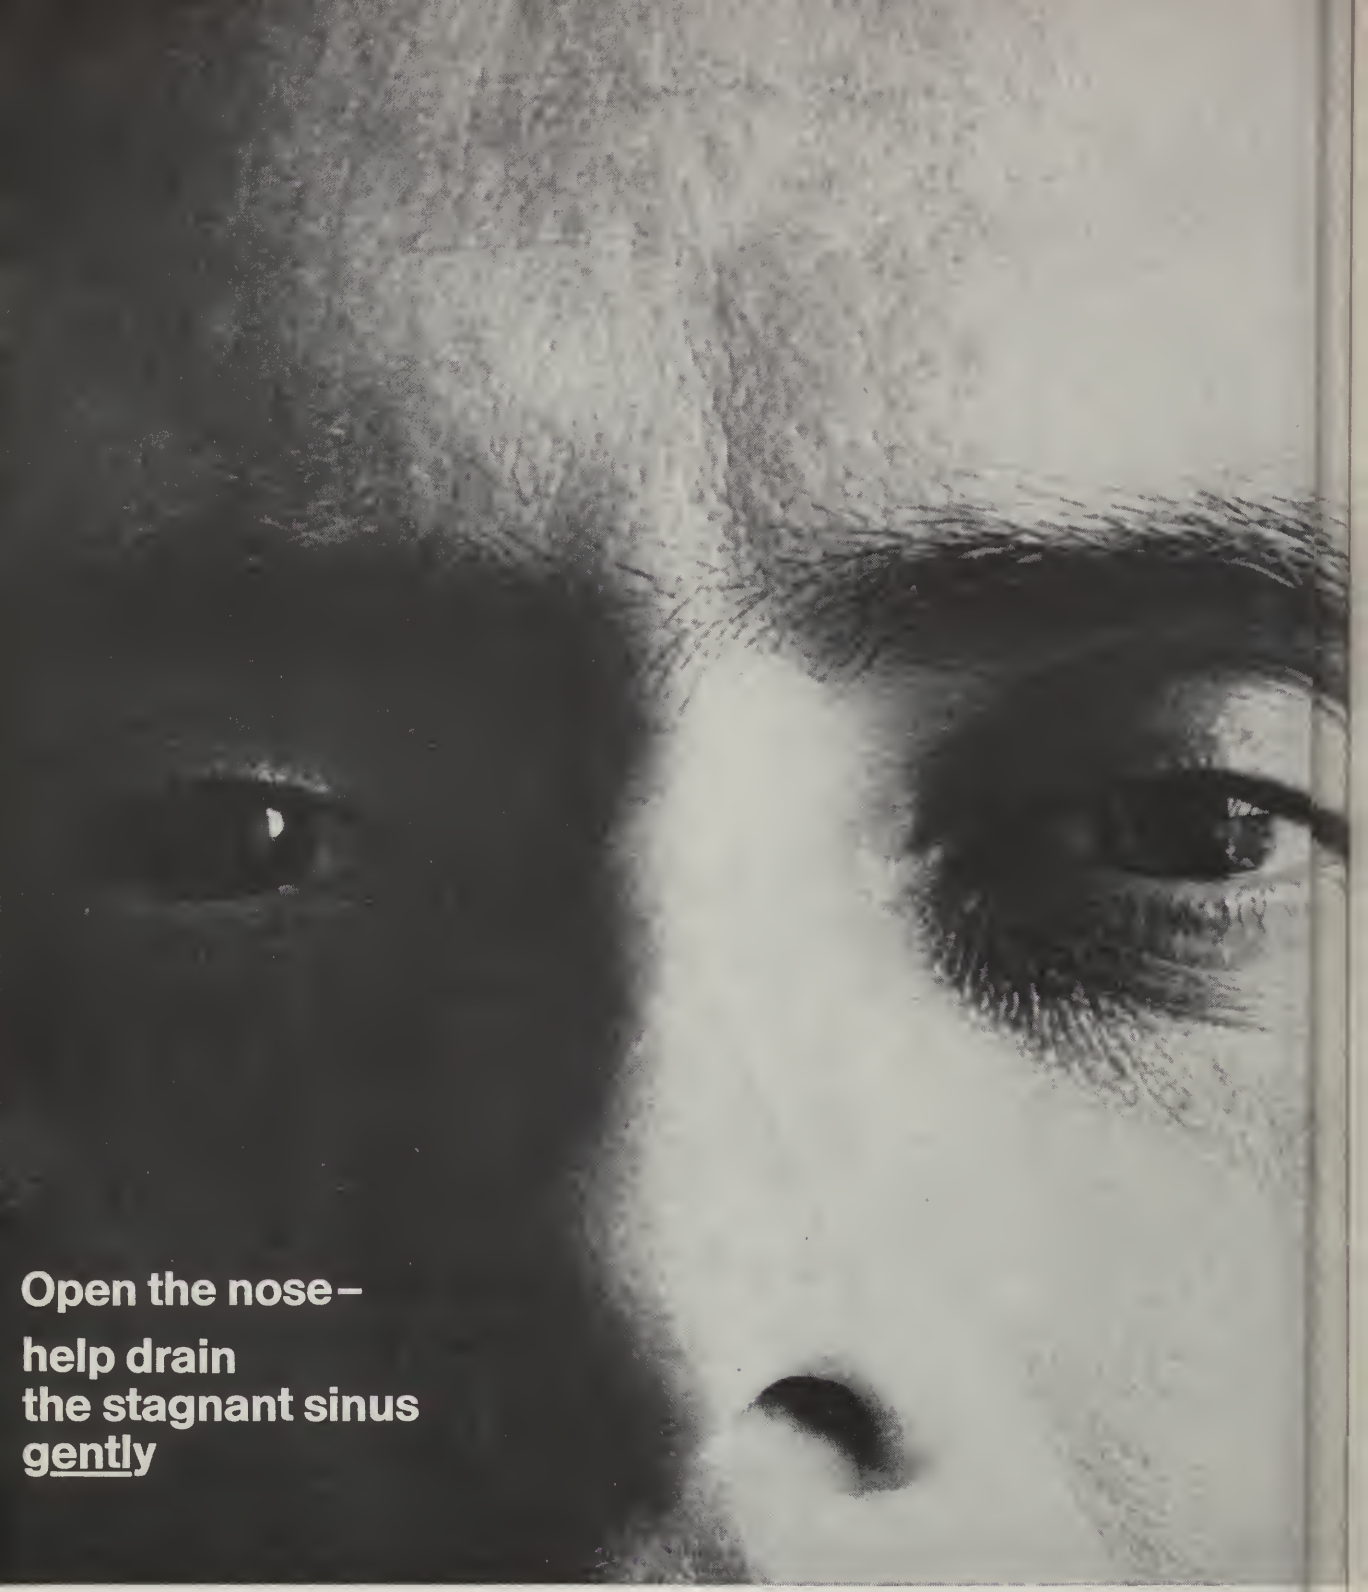
LACTINEX®

TABLETS & GRANULES

to help restore and stabilize the intestinal flora

for fever blisters and canker sores of herpetic origin

LACTINEX—a viable culture containing both *Lactobacillus acidophilus* and *L. bulgaricus*—was first introduced to help restore the flora of the intestinal tract in infants and adults.[1, 2, 3, 4]



Further clinical work showed LACTINEX to be successful in the treatment of fever blisters and canker sores of herpetic origin.[4, 5, 6, 7]

No untoward side effects have been reported in 12 years of clinical use.

Literature on indications and dosage available on request.

Neo-Synephrine is a standard among topical vasoconstrictors. It is unsurpassed for reducing nasal turgescence in colds; and a most valuable aid in preventing and treating sinusitis.

Neo-Synephrine stops the boggy feeling of colds at once—works against factors that induce sinusitis. With Neo-Synephrine nose drops, spray or jelly, turbinates shrink on contact, obstructed ostia open and drainage is re-established.

In sinusitis, Neo-Synephrine helps to promote drainage and hasten recovery.* Used promptly, it helps clear the stagnant sinus and lessen the chances of chronicity.

Neo-Synephrine HCl is available in:
1/8% solution for infants
1/4% solution for children and adults
1/4% pediatric nasal spray for children
1/2% solution for adults
1/2% nasal spray for adults
1/2% jelly for children and adults
1% solution for adults (resistant cases)

at Merck Sharp & Dohme...

understanding... precedes development

The development of chlorothiazide and probenecid were events of major importance, but perhaps even more important for the future was the Renal Research Program by which they were developed. When Merck Sharp & Dohme organized this program in 1943, it was expressing in action some of its basic beliefs about research:

• Many problems connected with renal structure and function were still undefined or unsolved. The Renal Research Program would begin its basic research in some of these problem areas.

• From knowledge thus acquired might come clues to the development of new therapeutic agents of significant value to the physician.

For example, the Renal Research Program put fifteen years into this search before chlorothiazide became available. But because these years had first led to a greater understanding of basic problems, the desired criteria for chlorothiazide existed before the drug was developed.

Along with other research teams at Merck Sharp & Dohme, the Renal Research Program continues to add new understanding of basic problems—understanding which will lead to important new therapeutic agents.

MARK THESE IMPORTANT DATES ON YOUR CALENDAR

April 27-May 4, 1966—Annual meeting, Medical and Chirurgical Faculty of the State of Maryland. April 27-28, Baltimore—April 29-May 4, Aboard ship and in Bermuda

MEDIC PROGRAMS

January 28—1-2 PM

From Frederick Memorial Hospital: "Some Unusual Presentations of Lymphoma," Ernest W. Smith, MD.

February 4—12:30-1:30 PM

From University Hospital: "Problems in the Diagnosis of Coronary Disease," Leonard Scherlis, MD.

February 9—8 PM

From Anne Arundel County Medical Society: "Lang Term Effects of Estrogen—Progestin Combinations," Alvin F. Goldfarb, MD.

February 11—12:30-1:30 PM

From The Johns Hopkins Hospital: "Arthritis," Lawrence E. Shulman, MD.

February 25—1-2 PM

From Frederick Memorial Hospital: "Iron Metabolism," Major Marcel Conrad.

You may hear these programs in the Faculty auditorium or at one of the participating hospitals.

MARYLAND DERMATOLOGICAL SOCIETY

January 26—7:30 PM—Velleggia's Restaurant, Baltimore

"Skin Diseases in Pakistan," Celeste Woodward, MD, University of Maryland School of Medicine.

MARYLAND SOCIETY OF ANESTHESIOLOGISTS

February 1—7:30 PM—1211 Cathedral St., Baltimore

"Problems Facing Anesthesiology in America," Perry P. Volpitto, MD, Medical College of Georgia.

BALTIMORE CITY MEDICAL SOCIETY

February 4—8:30 PM—1211 Cathedral St., Baltimore

THE PHYSICIAN AND MEDICARE—REHABILITATION

"Resources," Aubrey D. Richardson, MD, medical director, Keswick Nursing Home.

"Physical and Occupational Therapy Techniques," Paul F. Richardson, MD, associate professor of physical medicine and rehabilitation and head, Division of Physical Medicine and Rehabilitation, University of Maryland School of Medicine.

"Problems in Cerebrovascular Strokes," Douglas G. Carroll, MD, chief, physical medicine and rehabilitation, Baltimore City Hospitals.

"Techniques in Arthritis," B. Stanley Cohen, MD, physiatrist-in-chief, Department of Physical Medicine and Rehabilitation, Sinai Hospital of Baltimore, Inc.

Acceptable for 2 hours Category 1 credit by the American Academy of General Practice.

February 10—8:30 PM—1211 Cathedral St., Baltimare

MARYLAND PSYCHIATRIC SOCIETY

"The Psychatherapies Including Psychaanalysis," A. Russell Anderson, MD, directar and training analyst, Baltimare Psychaanalytic Institute. Discussant: Robert W. Gibsan, MD, medical director, Sheppard and Enach Pratt Haspital.

February 11

HEART ASSOCIATION OF THE LOWER EASTERN SHORE

Teaching sessians for physicians: "Intensive Care of the Patient with Myacardial Infarctian," Jahn J. Curry, MD.

February 16—Sheratan Belvedere Hatel, Baltimare

BALTIMORE CITY DENTAL SOCIETY

3 PM—"Dentistry far the Handicapped," Dr. Soloman Rasenstein
6 PM—Cacktails and Dinner
7:30 PM—Projected Clinics—Mid-Atlantic Pedadantic Study Club

February 20—Sheratan Belvedere Inn

MARYLAND THORACIC SOCIETY

Sixth annual scientific sessian and third annual Trudeau lecture. Registratian, 9:30 AM; lunchean, 12:30 PM; Trudeau lecture, 1:45 PM—"The Diagnasis and Treatment af Pulmanary Mycoses," Jahn P. Utz, MD, Prafessar af Medicine, Medical Callege af Virginia.

Sunday afternaans—2 PM—WMAR-TV, Channel 2

MEDICINE 1966

Spansared by Baltimare City Medical Saciety, Committee an Public Educatian. William Schuman, MD, Chairman.

POSTGRADUATE COURSES

UNIVERSITY OF MARYLAND

7. CLINICAL ANATOMY—February 2 through May 25

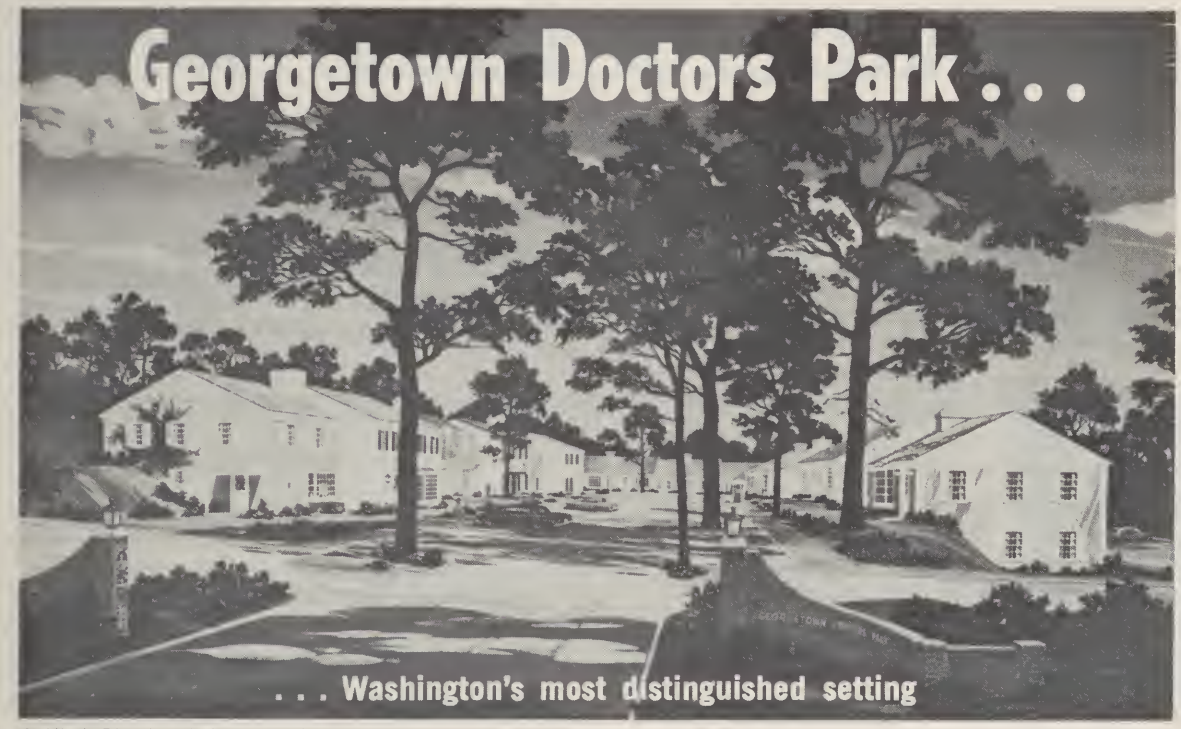
Under direction of Otto C. Brantigan, MD: Emphasizing the practical application of anatomy and anatomical principles in physical and x-ray diagnasis. Anatomical knowledge is related ta the use of needling in performing diagnastic procedures and in treatment. The caurse is directed taward bath the medical man and the surgeon. It is on aid in preparatian far the American Board Exam.

8. OBSTETRICS—February 10

Under direction of Edmund B. Middletan, MD: Prablems of obstetrical manegement in the prenotal period ond at the time of delivery will be considered.

9. HEMATOLOGY—March 10

Under direction of Carrall L. Spurling, MD: A basic review of diseases of the hemopaietic system. Illustrative peripheral blood and bone marraw slides will be used in connectian with selected case material. Newer techniques of diagnosis ond treatment will be discussed.



AMERICAN COLLEGE OF PHYSICIANS

Course No. 10—CURRENT CONCEPTS OF INFECTIOUS DISEASES, February 7-11, Jeffersan Medical College, Philadelphio.

Course No. 11—MEDICAL GENETICS, February 14-18, The Johns Hopkins University School af Medicine.

Course No. 12—CANCER, February 21-25, Presbyterian-St. Luke's Hospitol, Chicaga.

Inquire: Edward C. Rosenow, Jr., MD, executive director, The American College af Physicians, 4200 Pine St., Philadelphia, Pa. 19104.

Architect: Edward H. Noakes & Associates, A. I. A.

Here is a superb setting for the medical man who knows the importance of environment for his office location. In the heart of suburban Bethesda's medical research complex, Georgetown Doctor's Park features office suites of approximately 600, 900, 1200, and 1500 square feet specifically designed for doctors or dentists. Patients may park just steps from your ground level entrance.

- Immediate occupancy
- Sound conditioning
- Charmingly designed colonial facades
- Individually controlled air conditioning and heating
- Tree-studded setting
- Private entrance to each suite
- Directly across from the National Institute of Health and two minutes from Suburban Hospital
- Less than one mile from Beltway

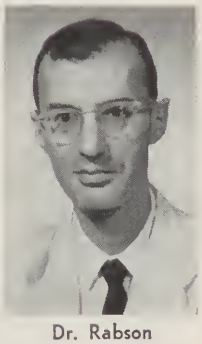
MAKE YOUR RESERVATION *TODAY* FOR THE
BERMUDA CRUISE CONVENTION

Five wonderful days of medical education combined with fun and relaxation

A full scientific schedule has been planned by the Committee on Program and Arrangements under the chairmanship of John Collins Harvey, MD.



In addition to the speakers listed last month in the JOURNAL and those to be listed in future issues, the following lectures will be given:

The Second annual George M. Boyer, MD, Lecture will be given on Wednesday, April 27, by **JOHN PARKS, MD,** whose subject will be **Families and Physicians.** Dean of The George Washington University School of Medicine since 1957, Dr. Parks is also professor of obstetrics and gynecology there. He was born in Oklahoma, received his MD degree from the University of Wisconsin, and served an internship at the Cincinnati General Hospital and a residency in obstetrics and gynecology at the Wisconsin General Hospital. Dr. Parks was director of the American Board of Obstetrics and Gynecology from 1950 to 1961 and was medical director of The George Washington University Hospital from 1957 to 1965. He is consultant in obstetrics and gynecology at the National Institutes of Health and the Walter Reed Army Medical Center and is president of the National Board of Medical Examiners.

Dr. Parks

On April 28, **ALAN S. RABSON, MD,** will speak on the **Viral Origin of Cancer.** His presentation will be the Harvey Grant Beck Memorial Lecture. Dr. Rabson was born and educated in New York, receiving his MD degree from the Long Island College of Medicine. He was an intern in medicine at the Massachusetts Memorial Hospitals, which included five months training in infectious disease at the Haynes Memorial Hospital, Boston. He was an assistant resident in pathology at the University Hospital in New York City. In 1952 he was commissioned in the U.S. Public Health Service, taking an assistant surgeon course in epidemiology at the Communicable Disease Center, Atlanta. From 1952 to 1953, Dr. Rabson was director of the health study of the Detroit-Windsor International Air Pollution Study, Epidemiology Branch, Communicable Disease Center, Detroit City Health Department. Since 1956, he has been a staff member of the Laboratory of Pathology at the National Cancer Institute, Bethesda.

Dr. Rabson

H. CURTIS WOOD, JR., MD, medical field consultant and lecturer for the Association for Voluntary Sterilization, Inc., has been a practicing obstetrician and gynecologist for 30 years, during which time he practiced at the Episcopal and Stetson Hospitals in Philadelphia. Dr. Wood, upon invitation of Dr. Trimble, will give the annual I. Ridgeway Trimble Lecture on April 27, on **Medicine's Responsibility in the Population Explosion.** Dr. Wood's presentations have been favorably received at the state medical societies where he has spoken. He is well qualified to discuss the medical, social, economic, and legal aspects of voluntary sterilization. He is deeply convinced that involuntary, irresponsible parenthood compounds the most serious problems, from the worldwide population explosion to family difficulties in achieving harmony and emotional stability. Dr. Wood believes that expanded educational programs on all aspects of birth control are urgently needed to help parents limit their families to the number of children they can care for and nurture.

Dr. Wood

Proof? See inside—

DRAMATIC TEST PROVES FILTER QUEEN TRAI

1 Place a fresh Sanitary Filter Cone in the FILTER QUEEN container. (It takes only a moment to open the machine and replace the old Filter Cone.)

2 Now unfold a clean white handkerchief and drop it into the Sanitary Filter Cone. (Even the daintiest, sheerest handkerchief may be used with perfect safety.) Then replace the turret top on the container.

3 Now turn the machine over to any on witnessing the demonstration, and have he start the machine and apply the nozzle to an place where there is obvious dirt and dus Keep the machine operating for a full minute

See the proof with the
FILTER QUEEN
"clean handkerchief" test

4 Remove the top of the container, and lift out the handkerchief. You'll find it spotless as it was when it went in! (Where did the dirt go? Look in the bottom of the container.)

DUST AS NO "VACUUM CLEANER" CAN!

Revolutionary...and in a class by itself!

FILTER QUEEN

has the scientific cleaning features that hospitals need most

All "vacuum" cleaners were much the same until the FILTER QUEEN SANITATION SYSTEM was designed. FILTER QUEEN'S patented Sanitary Filter Cone eliminates the need for messy bags, traps practically all airborne contaminants passing into the machine (Harvard Medical School Report in Journal of the American Medical Association, November 25, 1958).*

Experienced hospital housekeepers know this well. That is why FILTER QUEENS have replaced every type of vacuum cleaner in hundreds of hospitals throughout the world.

FILTER QUEEN has no porous bag that permits dust and dirt to reenter the room. FILTER QUEEN operates on an entirely different principle, "Cyclonic Cleaning Action." Here's how it works: Inrushing air, laden with dirt and dust, is deflected by a patented inlet guide as it enters the

container; then is whirled by centrifugal force away from the cone. Dust and dirt are dropped to the bottom of the container. (See illustration.) Air, being lighter, is funnelled to the center of the "cyclone," filters through the Sanitary Filter Cone and returns to the room dust-free.

Why not ask your local FILTER QUEEN Distributor to make the dramatic handkerchief test (pictured at left) in your hospital? There is no better way to prove the improvement in cleaning ability between a FILTER QUEEN SANITATION SYSTEM and any type of vacuum cleaner. (You'll find your distributor listed in the Yellow Pages; or write Health-Mor, Inc. direct).

**We will be glad to send you a reprint of this report on request.*

What hospital administrators say about FILTER QUEEN

"I heartily recommend to any hospital administrator who is presently unhappy with the type of cleaning machine in use, that he try FILTER QUEEN for only two days and the machine will sell itself."

"The FILTER QUEEN is great—a very important factor in patient areas, and is constructed so as to prevent air turbulence of dust at floor level. Filtering of the air, while in general operation, is also a very important and desirable factor."

"One of the most pleasing features of the machine is its quietness. We can even clean in the rooms while occupied by the patients, and many have commented on how pleasant it is not to be disturbed by noisy, old-fashioned vacuum cleaners anymore."

"The air exhaust at the top of the unit is a wonderful feature, and the Sanitary Filter Cone is certainly our answer for working in closely confined patient areas."

"We thought we had a clean hospital and a fairly good method of achieving acceptable sanitation, but this little machine made us revise our thinking and our methods."

"A quiet motor which possesses excellent cleaning power and the convenience of having to clean out the cleaning compartment only once a month, has proved very advantageous. One of the most important points . . . is that there is no bag to empty."

EXECUTIVE SECRETARY'S NEWSLETTER

January, 1966

RESOLUTIONS

Resolutions for consideration at the Faculty's Annual Meeting, April, 1966, must be in the Faculty office before MARCH 1, 1966, in order to be considered. No date has been set as yet for the Reference Committee hearing.

GENERAL ASSEMBLY CONVENES

The State General Assembly opens on January 19 for a 70-day session. The first issue of The Assemblyman is scheduled for publication early in January, 1966, followed by four subsequent issues.

Physicians interested in legislative activity on a state level are urged to peruse items of interest to the medical profession in Maryland.

Fuller details on any particular item may be obtained from the Faculty office. And let us know your views so you may be adequately represented at the State House, Annapolis.

PSYCHIATRIC BEDS IN GENERAL HOSPITALS

On recommendation of the Emotional Health Committee, the Faculty's Council has approved the concept that it "heartily supports" the inclusion of psychiatric services, both in-patient and out-patient care, in all general hospitals in Maryland.

CORRECTION

In a recent communication about ADOPTION, reference was made to the illegality of physicians concerning themselves with adoption in Maryland. Under present laws, Washington and Garrett Counties are excluded from the provisions of this Act.

WELCOME BACK

We are pleased to welcome back Bristol Laboratories as an advertiser in the Maryland State Medical Journal.

TAXES

Physicians are reminded that dues and assessments paid to medical societies are a tax-deductible professional expense.

Physicians are also reminded that they are now covered under the social security provisions of the Medicare law (PL 89-97). Taxes for the 1965 calendar year will amount to $259.20; in 1966 to $405.90.

NOTICE TO PHYSICIANS

The State Board of Health and Mental Hygiene has brought to the Faculty's attention that Mr. Richard D. Culler, "...is not licensed to practice physical therapy in Maryland, never has been and, according to his own statement, graduated from a school of physical therapy which is not approved by the Council on Medical Education of the American Medical Association."

Similar information was obtained from the Physica Therapy Examining Board of D.C.

NEWS NOTES

A. Austin Pearre, M.D., Frederick, has been named college physician emeritus by Hood College in recognition of his 40 years as physician to the Hood campus community.

William J. Peeples, M.D., State Health Commissioner, has been selected to serve on the National Advisory Council on Regional Medical Programs - PL 89-239, the program originally designated Heart Disease, Cancer and Stroke Regional Centers.

Certified a Fellow of the American College of Anesthesiology is John William Pearson, M.B., Towson.

Harold Roll, M.D., has been certified by the American Board of Ophthalmology.

IMPORTANT SUGGESTION

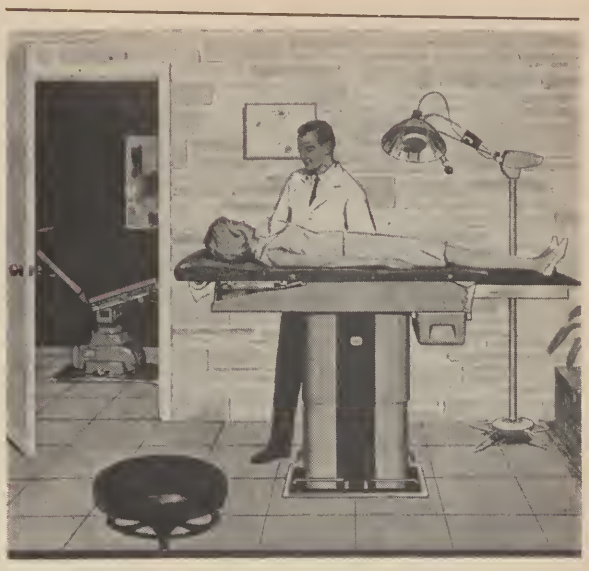
Physicians who order their statements in large quantities might anticipate some changes in form and content as the July 1, 1966, deadline for "Medicare" approaches. Rules and regulations still to be issued may influence the wording of such statements.

Some physicians have suggested that additional wording be included indicating, "this is your permanent record, no duplicates can be furnished.

John Sargeant

Executive Secretary

Why do so many DOCTORS choose MERCANTILE-SAFE?



Many physicians make Mercantile-Safe Deposit their bank, because we offer full-range bank and trust services . . . because we offer *personal* services that save busy doctors time, trouble and worry in handling their financial affairs. Here are just a few of our many services that are of particular value to doctors:

- **MERCANTILE-MEDAC** a fully-automated record keeping and billing system for doctors.
- **PRESTIGE CHECKING ACCOUNTS** with computer accuracy and speed of processing.
- **ESTATE PLANNING** to assure heirs the fullest benefits from estates.
- **AGENCY ACCOUNTS** to save time and worry in handling of investments.
- **EXECUTOR and TRUSTEE** of estates . . . and services of the State's largest Trust Division.

MAKE MERCANTILE-SAFE YOUR BANK!

MERCANTILE-SAFE DEPOSIT and Trust Company
Chartered 1864

Banking Locations: CALVERT & REDWOOD STREETS

When
tetracycline
is indicated in
these candidates
for Candida...
1.
2.
3.
4.
5.

New low-cost tetracycline/ antifungal therapy

Tetrex®-F

tetracycline phosphate complex –nystatin

Because new Tetrex-F (tetracycline phosphate complex-nystatin) is the most economical therapy of its kind that you can prescribe, it is a sound choice whenever tetracycline therapy is indicated in patients predisposed to monilial infections.

Who are these "candidates for Candida?"

1. diabetic patients
2. nonpregnant women with a history of recent or recurrent monilial vaginitis
3. elderly or debilitated patients
4. patients with a past history of moniliasis
5. patients on long-term tetracycline or corticosteroid therapy.

For these patients, Tetrex-F provides efficient tetracycline therapy against a broad range of infections *plus* protection against superinfection associated with the overgrowth of *C. albicans* in the G.I. tract.

Priced for savings

Tetrex-F is lowest in cost—priced 20% lower than most tetracycline/antifungal products.

BRISTOL THERAPEUTIC SUMMARY
For complete information, consult Official Package Circular.
Indications: Infections of respiratory, gastrointestinal, and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms.*
Contraindications: The drug is contraindicated in patients hypersensitive to its components.
Warnings: Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. No cases of photosensitivity have been reported with Tetrex. With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood).
Precautions: Bacterial superinfection may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months.
Adverse Reactions: Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis, and allergic reactions may occur.
Usual Adult Dose: 250 mg. *q.i.d.* Continue therapy for 10 days in beta-hemolytic streptococcal infections. Administer one hour before or 2 hours after meals.
Available: Capsules, tetracycline phosphate complex, 250 mg., and nystatin, 250,000 units.

*In patients with increased susceptibility to monilial infections.

Low host resistance?

Consider the "extra" antibacterial activity of Ilosone®

Occasionally, therapeutic failure is due to the patient's inability to mobilize his defenses sufficiently to overcome infection. Typical of this is the debilitated patient, the premature infant, or the diabetic. It is in these patients that the high levels of antimicrobial activity of Ilosone are especially useful. Ilosone has demonstrated antibacterial levels two to four times those of erythromycin base or stearate. Furthermore, it attains them earlier and maintains them longer. Even the presence of food does not appear to affect the activity of Ilosone.

Contraindications: Ilosone is contraindicated in patients with a known history of sensitivity to this drug and in those with preexisting liver disease or dysfunction.

Side-Effects: Even though Ilosone is the most active oral form of erythromycin, the incidence of side-effects is low. Infrequent cases of drug idiosyncrasy, manifested by a form of intrahepatic cholestatic jaundice, have been reported. There have been no known fatal or definite residual effects. Gastro-intestinal disturbances not associated with hepatic effects are observed in a small proportion of patients as a result of a local stimulating action of Ilosone on the alimentary tract. Although allergic manifestations are uncommon with the use of erythromycin, there have been occasional reports of urticaria, skin eruptions, and, on rare occasions, anaphylaxis.

Dosage: *Children under 25 pounds*—5 mg. per pound of body weight every six hours. *Children 25 to 50 pounds*—125 mg. every six hours. *Adults and children over 50 pounds*—250 mg. every six hours. For severe infections, these dosages may be doubled.

Available in Pulvules®, suspension, drops, and chewable tablets. Ilosone Chewable tablets should be chewed or crushed and swallowed with water.

Editorial

WHY COUNTY MEDICAL SOCIETIES NEED AN EXECUTIVE SECRETARY

ROBERT vL. CAMPBELL, MD
President, Medical and Chirurgical Faculty of the State of Maryland

How well, doctor, is your local medical society doing its job?

Are records and correspondence kept up to date?

Is there adequate communication among your membership?

Do the citizens of your community know where to call for information?

Are their inquiries and their grievances taken care of courteously and promptly?

Is effective liaison maintained with your state society, the AMA, community health agencies, civic organizations, and the press?

Are committee activities coordinated and society projects carried out efficiently?

Are projects started or encouraged by your state and national organizations effectively implemented at the county level?

Is your society making friends for the medical profession in your community?

The officers of your county society—perhaps you are one—are busy physicians with patients to care for, hospitals to visit, books and journals to read, and families whom they would like to see occasionally. The work of the county medical society has become so complex that it is not possible for the officers and the members to perform efficiently all the details that are necessary for a well-functioning organization.

If you have answered "no" to some or all of the questions above, your society should consider employing an executive secretary. A man or woman, assisting part time or full time, depending on your need, can relieve your officers of the many burdensome details. Her—or his—office gives your society an address and a phone number which do not change with each election. It becomes the hub of your society, from which all activity radiates. Correspondence and records are maintained here, and communication at all levels originates here. Continuity continues as officers change from year to year.

The growing number of inquiries from the public and the press, the public service approach, the larger volume of paperwork, the wider scope of medical society activities, and the urgent need for better public relations make it imperative for county medical societies to operate on a businesslike basis.

LUCIE F. MAGUIRE
BALTIMORE CITY MEDICAL SOCIETY

The Baltimore City Medical Society, with headquarters in the Medical and Chirurgical Faculty building, employs a full time executive secretary and an assistant. The society's membership exceeds 1,800. Mrs. Maguire's duties are numerous and varied, covering office management and administration. As secretary to the president and members of the Executive Committee, she relieves these busy officers of many details required to implement actions initiated by the Board of Directors and the membership.

The Baltimore City Medical Society has 20 committees, many of which require setting up appropriate office routines to assure efficient handling of their activities. Statistical reports of membership are prepared from records maintained in the society office. Liaison with the Baltimore City Health Department, Civil Defense Division, and the Boy Scouts of America entail securing and keeping records of physician volunteers for various projects.

Mrs. Maguire was employed by the Medical and Chirurgical Faculty in 1949 and became executive secretary of the Baltimore City Medical Society in 1958. Her previous experience as private and administrative secretary in both commercial and professional offices serves her well in performing her present duties.

DOROTHY E. HOLMAN
BALTIMORE COUNTY MEDICAL ASSOCIATION

Baltimore County Medical Association has approximately 250 members. Mrs. Dorothy Holman spends about 20 hours a week doing the secretarial, bookkeeping and other related duties, such as publicity, helping the program chairman to arrange meetings, and assisting in preparation of the association's membership directory.

In addition to attending all the meetings of the Baltimore County Medical Association, she attends meetings of the Medical and Chirurgical Faculty and of the AMA which might be of particular interest to the association and reports to the members on these meetings.

Mrs. Holman has held her part time position with the Baltimore County Medical Association since 1961. She is also a full time medical assistant in the office of J. Morris Reese, MD. She has a business background, having taken a commercial course at the Baltimore College of Commerce. The course included psychology and commercial law as well as the usual business skills. She then worked at Bon Secours Hospital as secretary to the superintendent for four years. Her diverse duties there even included teaching shorthand to several of the nuns.

JOHN W. LOY
MONTGOMERY COUNTY MEDICAL SOCIETY

The Montgomery County Medical Society, with more than 600 members, requires a full time executive secretary and office staff. John Loy spends five and a half days a week in his management and administrative duties. These include supervising the activities of management and central activities, continuing the actions initiated by the president and the executive board, administering policies made by the society, and maintaining the society's membership and financial records. As managing editor of the county society's *Medical Bulletin*, he performs the editorial tasks necessary to its monthly publication. He maintains liaison and holds committee membership and appointments in and with county civic and lay health groups.

Another facet of his job includes that of general manager of the Bureau and Exchange, a $56,000 annual enterprise of the Montgomery County Medical Society. This is a financially self-sustained operation which carries out physician referrals, emergency call system, and the county-wide disaster program.

John Loy has been executive secretary of the Montgomery County Medical Society for nine years. His earlier experience included various positions of medical administration in the United States Army. He supplemented this experience with university courses in hospital and medical administration, money and banking, personnel administration, and applied psychology.

Six component societies in Maryland have an executive secretary. Baltimore City and Montgomery County have headquarters with a full time staff. Baltimore, Prince George's, Wicomico, and Washington Counties employ part time executive secretaries.

At least seven other county societies have a large enough membership to support one, and some of the smaller societies might consider joining with neighboring societies to employ a regional secretary.

I'm sure that every community has some likely candidates for the position. The sketches of some of our executive secretaries might suggest to you the type of person you would require. Generally, such a person should possess tact, executive capabilities, diplomacy, and an ability to get along with people. He or she should have office skills and be able to communicate effectively. Specific qualifications would depend upon your particular needs.

The technique of acquiring a part time secretary is not too involved. Your state society would be glad to give you advice. A visit or inquiry to county societies of comparable size to yours who have travelled this road might be informative.

145 W Washington St
Hagerstown, Md 21740

DAVID A. McNAMEE
PRINCE GEORGE'S COUNTY MEDICAL SOCIETY

Prince George's County Medical Society, with a current membership of about 200, employed David McNamee as a part time executive secretary in 1950. He was then working as assistant superintendent of the Prince George's General Hospital. Since the society was using the hospital as its meeting place, Mr. McNamee found it easy enough to do the little extra paper work required by the society.

His background at the time consisted of a degree in business and public administration from the University of Maryland. In 1953 he left the hospital to study law and now maintains a full time law practice. Throughout this period he has continued to assist the Prince George's County Medical Society.

Mr. McNamee described his duties as "the usual run of the mill for an executive secretary," but did not elaborate. His work load varies. There are many days when he does not spend an hour a day on the task; there are others when "I spend too many."

JOYCE HARLACHER
WASHINGTON COUNTY MEDICAL SOCIETY

With a membership approaching the 100 mark, the Washington County Medical Society is the most recent one to employ an executive secretary. In an office in her home, Mrs. Joyce Harlacher works an average of about 60 hours a month on behalf of the society. She is employed on a fee for service basis.

She has established files on several hundred subjects, publishes a monthly newsletter for the society, assists the executive committee in carrying out its duties, performs the necessary secretarial work, writes news releases and features for the local newspapers and radio stations, has organized and maintains a speakers bureau for the community, assists the committees in their duties, and attends meetings of the Washington County Medical Society, as well as those of the Medical and Chirurgical Faculty, the Medical Society Executives' Association, and the AMA Public Relations Institute.

Mrs. Harlacher holds a BA from the Juniata College, where she studied history and journalism. Her background is in the news media: she has written continuity and local commercials for radio and television, was a correspondent for a city newspaper, and has worked in promotion and publicity.

KIT HARGREAVES
WICOMICO COUNTY MEDICAL SOCIETY

Wicomico County Medical Society, with about 70 members, employs its executive secretary on a part time hourly basis, according to its needs. Mrs. Kit Hargreaves, working in her home, also acts as executive secretary for the Peninsula General Hospital and operates her own mimeographing service.

Activities pertaining to publicity and public relations for the society form a large part of her duties. Mrs. Hargreaves' background includes 12 years in radio and two years in the administrative office of the Peninsula General Hospital, where she did much of the hospital's public relations.

Mrs. Hargreaves acts as a clearing house for information for officers and members of the society, the news media, and the public. She maintains liaison with the local voluntary and other health and related agencies; edits the local newsletter, prepares news and feature articles for local radio and TV, newspapers and AMA publications; keeps abreast of new developments in health insurance, medical legislation, innovations in medical practice, and many other areas of interest to the members; does resarch or obtains special information as requested; and assists in planning and implementation of special projects. In addition, she performs all the office management, bookkeeping, and secretarial functions required by the Wicomico County Medical Society.

Mrs. Hargreaves is active in the Medical Society Executives' Association, which she finds a valuable source of information about medical societies' activities throughout the country. She is a member of the Membership and Attendance Committee of the MSEA.

For predictability of action, purity, and uniform potency...

The original DIGITOXIN

DIGITALINE NATIVELLE®

Presented in a full range of convenient dose forms, all interchangeable by reason of total absorption.

For complete prescribing information
See package circular, P. D. R. or write:
Professional Service Division
E. Fougera & Company, Inc.

In asthma and emphysema, OPTIPHYLLIN with its high absorption index attains predictable, dependable therapeutic blood levels, thereby relieving the feeling of "internal suffocation". Prolonged periods of remission and reduction in the severity of attacks extend the "atmosphere of freedom."

The refreshing green mint flavor of OPTIPHYLLIN tends to assure patient acceptability and to prevent drug fatigue. Thus for efficacy and acceptability, it is a drug of first choice in the treatment of asthmatic conditions.

Indicated in the management of bronchial asthma, emphysema and other pulmonary disorders associated with bronchospasm.

PRODUCTS OF **NATIVELLE INC.** DISTRIBUTED BY **E. FOUGERA & CO., INC.**, HICKSVILLE, NEW YORK

Air for the asthmatic... in an atmosphere of freedom.

Dosage (Calibrated dosage cup dispensed with each prescription) Each 15 ml. (1 tablespoonful) contains theophylline 80 mg., 20% alcohol. The adult dose in acute asthma attacks is 75 ml. of OPTIPHYLLIN, provided theophylline in any form has not been given in the preceding 12 hours. A maintenance dose of 30 ml. of OPTIPHYLLIN can be initiated 6 to 8 hours later and maintained t.i.d. Maintenance doses in chronic pulmonary conditions associated with bronchospasm and in emphysema vary from 45 ml. to 30 ml. t.i.d.

The pediatric dose in acute asthma is 0.5 ml. per pound of body weight, not to be repeated in less than 6 hours, and not more than 2 such dosages to be given in 24 hours. Maintenance dosage varies from 0.3 ml. to 0.2 ml. per pound of body weight t.i.d. until therapeutic effect is obtained. OPTIPHYLLIN is best absorbed on an empty stomach. *(Since nausea and vomiting usually herald early signs of excessively high theophylline blood levels, these manifestations should serve as early warning signs to reduce or discontinue further administration of* OPTIPHYLLIN.)

Side effects and precautions. As with all theophylline preparations, occasional nausea, epigastric and substernal burning pain and rare episodes of vomiting may be encountered. Other minor complaints are palpitations, dizziness, nervousness and headache. Overdosage, particularly in children, has led to severe vomiting, convulsions and lethargy. Theophylline should be given with caution in the presence of peptic ulcer and gout.

RESOLUTIONS

Important Notice for Component Medical Societies and Individual Members of Medical and Chirurgical Faculty

All resolutions or recommendations for presentation to the House of Delegates must be in the Faculty Office by Tuesday, March 1, 1966, which is eight (8) weeks prior to the Annual Meeting. This is referred to in the following quote from the Faculty Bylaws:

. . . A Reference Committee of five members of the House of Delegates to which all Resolutions involving questions of Faculty policy, except those proposed by the Council or committees of the Faculty, shall be referred at least eight weeks prior to any regular session . . . of the House of Delegates. All such resolutions shall be reported to the House of Delegates with the committee's recommendations, provided that, with the sponsor's approval, the committee may revise any resolution.

The meeting of the Reference Committee is open to all members of the Faculty in good standing, who may attend and express their opinions. Notice of the date and place of the Committee meeting will be sent to all members.

RESOLUTIONS for April 1966, House of Delegates must be in the Faculty Office by TUESDAY, MARCH 1, 1966

Your MEDICAL FACULTY at Work

JOHN SARGEANT — EXECUTIVE SECRETARY

EXECUTIVE COMMITTEE, OCTOBER 28

Joint meeting with Executive Committee of Hospital Council

1. A report was made by the Hospital Council on Utilization Committee activities. This was primarily a report of progress and interpretation to physicians.

2. Discussion of problems connected with the Medicare law took place. The Hospital Council was told of the Faculty's policy that participation was up to the individual physician. Copies of information mailed to physicians on this subject are to be sent to hospital administrators as well.

3. A report was made on areawide health facilities planning. This will be discussed further at the next meeting of the Faculty's Executive Committee.

4. Certain problems of physician-hospital relations were considered, especially in relation to the corporate practice of medicine. Of particular concern was the matter of payment directly to physicians rather than to hospital funds. Specific answers are to be sought as to what arrangements are or are not ethical.

EXECUTIVE COMMITTEE, NOVEMBER 18

1. After ascertaining the legality of billing for MMPAC dues along with Faculty and component society dues, it was voted to do this for 1966. In subsequent years, this can be included as a printed line item on the Faculty dues bill, subject to certain legal requirements.

2. Physicians Defense was ratified for a member.

3. Approval was given to printing cards listing phone numbers and contacts of hospital outpatient services in Maryland. This information will be included in a future mailing to Faculty members.

COUNCIL, NOVEMBER 18

1. A summary of educational fund expenditures and appropriations was approved and is to be distributed to all Faculty members in the next membership mailing.

2. The dues of two physicians were remitted because of illness.

3. Emeritus membership is to be recommended for J. Marion Bankhead, MD, Montgomery County, and J. E. Bradley, MD, Baltimore City.

4. The following recommendations of the Ad Hoc Finance Committee were adopted: 1) that securities of the Faculty's investment program be registered in nominee form, and 2) that the Bylaws Committee be asked to prepare an amendment to give the Finance Committee permanent status.

5. Legal defense was ratified for members requesting it.

6. Announcement was made of the settling of legal cases involving Faculty members.

7. The following actions are to be taken in connection with the Faculty's Diabetes Subcommittee and the Maryland Diabetes Association:

1) The Maryland Diabetes Association is to be asked to use the services of physicians for physical examination of children attending the diabetes camp; properly qualified paramedical personnel should be used for screening before examination by physicians.

The use of optometrists for eye examinations would be unethical.

2) A letter is to be sent to the Maryland Diabetes Association reaffirming the Council's opposition to use of the name Camp Med-Chi for the diabetes camp.

3) As soon as possible, the telephone listing of *Diabetes Committee of Maryland* should be changed to *Diabetes Committee of the Medical and Chirurgical Faculty of Maryland.*

8. The following recommendation of the Policy and Planning Committee was considered:

> **That the Faculty make application to the federal government, when appropriate, for construction funds for library purposes (matching up to 75% of cost of construction); and that the Library Committee, in cooperation with the Policy and Planning Committee, give serious thought and consideration to an expansion and coordination of services with hospital libraries throughout the state.**

The concept expressed in this recommendation was approved in principle, but no actual application for funds is to be made until further details are available.

9. A recommendation was adopted which heartily supports the inclusion of both inpatient and outpatient psychiatric services in all general hospitals in Maryland.

10. Council meeting dates for 1966 were approved.

11. Saturday, January 29, has been set for the special meeting of the Faculty's House of Delegates that has been petitioned for January, 1966.

12. The Guidelines for Expenditures from Educational Fund, drafted by the Public Relations Committee, was adopted. It was expressly understood that specific expenditures must be approved by the Council or the House of Delegates. This information is to be included with the financial status of the educational fund in the next Faculty mailing.

13. Anticipated state and federal legislative activity for 1966 was reviewed. The suggestion that reports on legislative activity be made to component societies weekly over the MEDIC network is to be pursued with the MEDIC committee. Details of anticipated legislation will be listed in the first issue of *The Assemblyman* in early 1966.

14. A sum of up to $200 from the educational fund was granted to the Subcommittee on Child Welfare for an exhibit on the Battered Child Syndrome to be used at the Faculty's annual meeting and throughout the state afterward.

15. The secretary of Health, Education and Welfare was notified that the Faculty prefers Blue Shield as the fiscal administrator for Medicare. It was made clear that this does not imply endorsement of the Medicare law.

16. The Mediation Committee reported on a survey of physicians associated with lay laboratories. Three indicated severance of their relationship; five indicated terms which were deemed ethical; and one, in violation of ethics, was advised to terminate the relationship.

17. A representative from E. D. Rosenfeld Associates, Inc., New York City, outlined activities in connection with a hospital survey being conducted for the Maryland Hospital Commission. He solicited opinions from Council on various subjects, such as hospital utilization and construction.

18. A recommendation was adopted that payments to podiatrists for care rendered on the prescription of a physician to medical care patients in nursing homes be endorsed.

19. Upon request to reconsider its policy in connection with Blue Shield payments to physicians for diagnostic x-ray procedures, the Council voted to let the present policy stand.

20. Walter S. Caution was placed on retirement status.

21. The Council was requested to take action forbidding the denial of membership in the Baltimore City Medical Society to new applicants. Since no specific cases of denial of membership could be produced, the Council declined to take any action until details were made available.

22. On recommendation from the Fee Schedule Committee, the Maryland Medical Service, Inc., is to be advised that in establishing fees for new procedures in various schedules, the Faculty is willing and anxious to 1) make data available in these areas from its files; 2) select names of physicians who perform these procedures so that Maryland Medical Service, Inc.,

DexameTH®

brand of DexamethasoneTABLETS 0.75 mg. & 0.5 mg.

MORE STEROID PER MG.
greater anti-inflammatory potency per mg. than most steroids yet developed

MORE STEROID PER $
available at a comparatively lower cost to your patients—economical for prolonged therapy

Dosage: In rheumatoid arthritis, the initial daily dosage ranges from 1.5 to 3.0 mg. Dosage is then decreased gradually to the minimum that will maintain sufficient relief. After extended therapy, withdraw drug gradually to allow recovery of adrenal function. In dermatoses, the effective dose is 3.0 to 6.0 mg. daily, depending upon severity and resistance to treatment. **Precautions:** At therapeutic dose levels, DEXAMETH (dexamethasone) may have less tendency to cause sodium or water retention, potassium excretion, disturbance in glucose metabolism or hypertension than some of the older steroids. With these exceptions, however, the drug may give rise to the metabolic and hormonal side effects characteristic of corticosteroids. It should, therefore, be used with great caution in the presence of tuberculosis and other infections, osteoporosis, peptic ulcer, fresh intestinal anastomoses, diverticulitis, thrombophlebitis, herpes simplex, psychotic tendency, pregnancy and in persons exposed to chickenpox, measles or scarlet fever. **Contraindications:** Ocular herpes simplex, arthritis complicated by psoriasis, tuberculosis of the eye and skin, fungal keratitis, local pyogenic infection.

Consult product brochure.

U. S. VITAMIN & PHARMACEUTICAL CORPORATION
800 Second Avenue, New York, N.Y. 10017

may contact representative physicians doing such procedures; and 3) suggest names of physicians who truly represent the profession in performing such procedures, for Maryland Medical Service, Inc., to contact.

23. A schedule of fees charged to the average semiprivate patient, compiled by the Fee Schedule Committee, was adopted with the notation that the Council may make amendments at its next meeting if necessary. The Fee Schedule Committee is to be required to review this schedule annually, or more often if necessary.

24. A revised report on tuberculin testing in Maryland schools was adopted.

NAME _____

ADDRESS _____

DEPROL®

meprobamate 400 mg. + benactyzine hydrochloride 1 mg.

Indications: 'Deprol' is useful in the management of depression, both acute (reactive) and chronic. It is particularly useful in the less severe depressions and where the depression is accompanied by anxiety, insomnia, agitation, or rumination. It is also useful for management of depression and associated anxiety accompanying or related to organic illnesses.

Contraindications: Benactyzine hydrochloride is contraindicated in glaucoma. Previous allergic or idiosyncratic reactions to meprobamate contraindicate subsequent use.

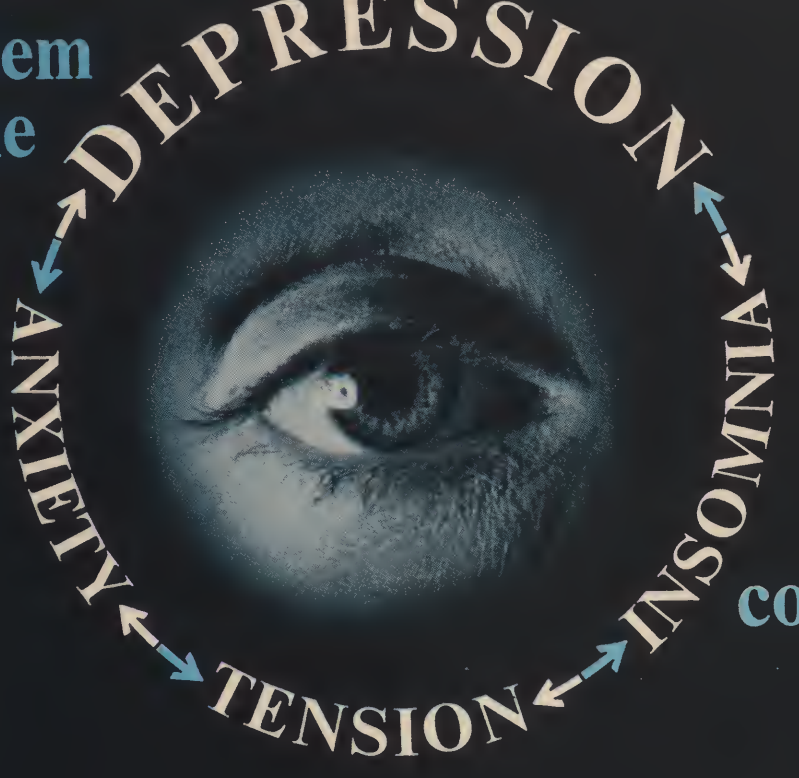
Precautions: *Meprobamate*—Careful supervision of dose and amounts prescribed is advised. Consider possibility of dependence, particularly in patients with history of drug or alcohol addiction; withdraw gradually after use for weeks or months at excessive dosage. Abrupt withdrawal may precipitate recurrence of preexisting symptoms, or withdrawal reactions including, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, the dose should be reduced and operation of motor vehicles or machinery or other activity requiring alertness should be avoided if these symptoms are present. Effects of excessive alcohol may possibly be increased by meprobamate. Grand mal seizures may be precipitated in persons suffering from both grand and petit mal. Prescribe cautiously and in small quantities to patients with suicidal tendencies.

Side effects: Side effects associated with recommended doses of 'Deprol' have been infrequent and usually easily controlled. These have included drowsiness and occasional dizziness, headache, infrequent skin rash, dryness of mouth, gastrointestinal symptoms, paresthesias, rare instances of syncope, and one case each of severe nervousness, loss of power of concentration, and withdrawal reaction (status epilepticus) after sudden discontinuation of excessive dosage.

Benactyzine hydrochloride—Benactyzine hydrochloride, particularly in high dosage, may produce dizziness, thought-blocking, a sense of depersonalization, aggravation of anxiety or disturbance of sleep patterns, and a subjective feeling of muscle relaxation, as well as anticholinergic effects such as blurred vision, dryness of mouth, or failure of visual accommodation. Other reported side effects have included gastric distress, allergic response, ataxia, and euphoria.

Meprobamate—Drowsiness may occur and, rarely, ataxia, usually controlled by decreasing the dose. Allergic or idiosyncratic reactions are rare, generally developing after one to four doses. Mild reactions are characterized by an urticarial or erythematous, maculopapular rash. Acute nonthrombocytopenic purpura with peripheral edema and fever, transient leukopenia, and a single case of fatal bullous dermatitis after administration of meprobamate and prednisolone have been reported. More severe and very rare cases of hypersensitivity may produce fever, chills, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, anaphylaxis, stomatitis and proctitis. Treatment should be symptomatic in such cases, and the drug should not be reinstituted. Isolated cases of agranulocytosis, thrombocytopenic purpura, and a single fatal instance of aplastic anemia have been reported, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity has been reported, usually after excessive meprobamate dosage. Suicidal attempts may produce lethargy, stupor, ataxia, coma, shock, vasomotor and respiratory collapse.

Dosage: Usual starting dose, one tablet three or four times daily. May be increased gradually to six tablets daily and gradually reduced to maintenance levels upon establishment of relief. Doses above six tablets daily are not recommended even though higher doses have been used by some clinicians to control depression and in chronic psychotic patients.



Supplied: Light-pink, scored tablets, each containing meprobamate 400 mg. and benactyzine hydrochloride 1 mg.

Before prescribing, consult package circular.

Frederick Memorial Hospital Presents

Postgraduate Education has a long tradition at the Frederick Memorial Hospital. The articles appearing in this issue represent a facet of postgraduate education as conceived and practiced at our institution.

After many years of abortive efforts to create a durable and dependable postgraduate education format, one of our self-searching studies led to the current program. The basic idea which evolved concerned the goal we aim to attain. The most we could hope to gain from postgraduate education was a stimulation of the individual's interest in pursuing the study of medicine in his postgraduate years on his own initiative.

To accomplish this goal, the meeting time was analyzed and a great deal of thought went into the final selection.

Next, the decision was made to precede the noontime meetings with a superior, gratuitous buffet luncheon. With the splendid cooperation of the administrator, this feature was quickly effected.

The problem of programming was resolved by allowing for nine annual outstanding lecture presentations by speakers from outside our staff. The cost of these speakers is met through a voluntary assessment of the staff, which has always succeeded in maintaining solvency. It further gave all contributors a personal sense of participation in the programs.

The subject for any year encompasses one anatomic system such

RENAL
Postgraduate Program in DISEASES

as kidney, hematopoietic, gastrointestinal, etc. The selection of individual lecture topics is made one year in advance. The system selection is made two years in advance. The topics are selected after extensive correspondence with authorities in the field throughout the country. After the topics are selected, outstanding speakers are engaged about one year in advance of the presentations. This is done for each of eight lectures. The final lecture consists of a panel of visiting experts in this field to whom local case presentations are made for detailed discussion. This final session is extended to a three-hour period.

While the central theme is carried on at the monthly postgraduate education meeting, each monthly service meeting attempts to correlate and coordinate the central theme in their department conferences, with an analysis of local cases.

It is from such correlation that the Medical Service in 1964-65 presented a series of talks by members of the hospital staff on renal diseases, which is the main theme of the postgraduate program for the year.

This format has been most successful in bringing a high percentage of the staff physicians to the meetings. Still, the Postgraduate Education Committee continues to acknowledge that the ultimate goal is the sustained, avid study by the individual staff physician.

Robert J. Furie, MD

following infection

STRESSCAPS B and C vitamins in therapeutic amounts...help the body mobilize defenses during convalescence...aid response to primary therapy. The patient with a severe infection, and many others undergoing physiologic stress, may benefit from STRESSCAPS.

Each capsule contains:	
Vitamin B_1 (as Thiamine Mononitrate)	10 m
Vitamin B_2 (Riboflavin)	10 m
Niacinamide	100 m
Vitamin C (Ascorbic Acid)	300 m
Vitamin B_6 (Pyridoxine HCl)	2 m
Vitamin B_{12} Crystalline	4 mcg
Calcium Pantothenate	20 m

Recommended intake: Adults, 1 capsul daily, for the treatment of vitamin deficiencies. Supplied in decorative "reminder" jars of 30 (one month's supply) and 10 (three months' supply).

Polycystic Disease of the Kidneys

LOUIS R. SCHOOLMAN, MD

When I was assigned the first talk of this renal program, I was given a list of diseases. I chose polycystic disease because I had observed and treated a patient from start to finish. I learned many lessons from this patient. I learned the difference between azotemia and uremia, when to press treatment, and the value of continued antimicrobial therapy. I learned that the diagnosis of polycystic disease need not be a sentence of imminent death and that the patient may carry on a normal family life for years. I relearned to respect and admire the quiet courage with which many patients meet the increasing afflictions of a chronic fatal disease.

I will confine this paper to congenital cystic disease of the kidneys and will not go into simple cystic disease or medullary cystic disease, which clinically resembles Addison's disease. I will first describe my case and then follow with a short review of the disease.

CASE REPORT

A 35-year-old farmwife, mother of an 11-year-old son, was admitted here October 30, 1950, two weeks after she had noticed a tender enlarging mass in the left flank. After intravenous and retrograde pyelograms were done, she was operated on for a kidney tumor. The surgeon found a polycystic kidney and did a nephrotomy. Her records show blood pressure 120/70, hemoglobin 13 grams, NPN 47 and 1+ albuminuria with 20-30 red blood cells and an occasional white blood cell.

When she first consulted me November 30, I learned that she was an only child and that her

The typical patient with congenital polycystic disease of the kidneys has a family history of renal disease and may expect symptoms to appear in the thirties or forties. These symptoms frequently are dragging lumbar or abdominal pain accompanied by abdominal enlargement. There already may be a history of recurrent urinary infection or renal colic.

On examination, one or both kidneys will be felt as hard irregular masses. Hypertension may be present, and the urine probably will show albumin and white blood cells. The intravenous pyelogram will show elongated calyces with some blunting and irregularity of outline. At present, such a patient may ordinarily expect to live about 10 years after the onset of symptoms but possibly may have a normal lifespan. Enlarging kidneys, increase in severity of symptoms, progression in associated hypertensive vascular disease, or decreasing renal function indicate a poor prognosis.

We are justified in a more optimistic attitude toward such patients. Alert medical supervision, the use of increasingly efficient antimicrobials, and carefully controlled hemodialysis and peritoneal dialysis can prolong life greatly. Perhaps in the near future kidney replacement will cure polycystic disease.

father and paternal aunt had polycystic kidney disease. She had had pneumonia without complication at 3 years and, 7 years later, scarlet fever which was followed by tachycardia for several months. Her only operation before the nephrotomy was a T&A in childhood.

She was 66 inches tall and weighed 124 pounds. Pulse was 90 and blood pressure 140/100. I found a tender mass about the size of a small grapefruit in the left flank. Her hematocrit was 40 and NPN 97.5. The urine was 1.009 and negative for albumin and sugar.

One month later the NPN was 45. During the next year, at monthly visits, she showed no appreciable change and did not complain of pain in the left flank except when jolted by a bump in the road. In the second year, I saw her every two to four months and found no appreciable change.

In June, 1953, I first noted enlargement of the right kidney. She weighed 139, had a blood presure of 160/98, and showed no albumin. During the next 18 months, the blood pressure rose gradually to 150-170/100-110 and pulse 100 to 120. She complained of frequent headaches and nervousness. Venipunctures were so difficult that only rarely was blood drawn for NPN. In October, 1954, it was 42 mg%.

After January, 1955, albuminuria and clumps of white blood cells became constant findings. Sulfisoxazole (Gantrisin), usually, and, at times, streptomycin and penicillin mixture controlled the pyuria and bouts of left flank pain but did not affect the proteinuria. She continued in her usual life and did all the duties required of a housewife and farmwife.

In April, 1956, bilateral flank pain developed. The left kidney had doubled in size, and the right was about the size of a large grapefruit. While the patient was on chloramphenicol, the urine was negative on culture. She felt better while taking this antibiotic and continued it at a dose of 250 mg twice a day. The blood pressure remained the same, but her weight gradually increased to 146 by December, 1956. In June, 1956, glycosuria first appeared, which, thereafter, was persistent from a trace to 1+. Antimicrobial drugs were given daily with chloramphenicol alternating with sulfonamides. She did not tolerate nitrofurantoin.

In September, 1957, she complained of almost constant nausea. Findings were: pulse 120, blood pressure 214/120, weight 143 pounds, urine 1.010, albumin and sugar 1+, microscopic, 10-15 white blood cells and many casts. NPN was 57 mg and hematocrit 32. Chlorpromazine helped to control the nausea. The enlarging left kidney prevented her from lying on her abdomen, so she was more comfortable sitting up. Headaches became almost constant.

In February, 1958, the left kidney mass became larger and more painful and tender. The NPN was 64 and fasting blood sugar 212. In March she vomited intermittently. The left kidney extended 18 cm below the left costal arch anteriorly. The blood pressure was 220/110, and her weight had dropped to 140 pounds. In April she complained of itching. By this time venipunctures were so very difficult that I spared her as much as possible and did blood chemistries rarely. (We did not have facilities for microchemistry.)

I began diabetic treatment first with tolbutamide (Orinase), then chlorpropamide (Diabinese) and phenformin hydrochloride (DBI), and finally insulin. None of these drugs controlled the glycosuria. It would show 1+ to 2+, and her nonfasting blood sugar would be slightly more than 200 mg%. The glycosuria and hyperglycemia were not caused by chlorothiazide, for it was not yet available. She had no family history of diabetes, which made me wonder whether cysts of the pancreas had developed.

By June, 1958, she was deeply bronzed and complained greatly of itching. She would regularly vomit her midday meal. There was no blood or coffee ground staining of the vomitus. On June 27 she entered the hospital complaining of an acute pain in the right kidney area, probably caused by a hemorrhage into a renal cyst. Both kidney masses were very large. The blood pressure was 180/100, and the urine showed 1.010, albuminuria 1+, glycosuria 1+, and white blood cells too numerous to count. Culture showed an alpha streptococci sensitive to all antibiotics, sulfonamides and nitrofurantoin. The hemoglobin was 8.5 gm, hematocit 26, NPN 103, fasting blood sugar 144, potassium 4.4 mg, and sodium 122 mg.

X-ray films showed large renal masses but no stones. During her week in the hospital, she did not vomit while on a rice diet. Her NPN dropped to 83 and the blood pressure to 180/90.

She left the hospital improved but thereafter

led a restricted life. She was unable to do anything but the lightest housework. She resigned her highly valued position as president of the county homemaker's club. She had passed the turning point of her disease, both physically and psychologically.

By August, while no stronger, she felt a great deal better. She told of a feeling of sudden disappearance of the right renal mass associated with a great increase of urine. Vomiting had not recurred, and the pruritis had disappeared. The blood pressure still varied from 204/90 to 250/110, and her hemoglobin from 7.5 to 8 gm during the next five months.

In January, 1959, she had severe pain of the left flank accompanied by gross hematuria. The mass was definitely larger. One month later she felt better. Her hemoglobin was 6.3 gm, NPN 64, nonfasting blood sugar 212. The urine showed 2+ albumin, 3+ sugar, and many white blood cells.

By May, 1959, nausea and vomiting had returned. The distention of her abdomen increased, and meperidine (Demerol) was required to relieve pain. Glycosuria persisted despite the use of insulin.

On May 24 the patient was readmitted for six days because of severe diarrhea and anasarca. The NPN was 80, blood sugar 81, hemoglobin 7 gm, and hematocrit 21. The urine was 1.008 and showed a trace of albumin and no sugar or acetone and only 6 to 7 white blood cells and 8 to 10 red blood cells. The culture was negative. She was treated simply with a strict Kemper rice and fruit diet. The NPN dropped to 38.

After she returned home, vomiting recurred daily. Her mouth and tongue were sore and showed purpura of the buccal mucosa and hyperkeratosis of the tongue. Her hands showed tremor and legs 4+ edema which extended to the thighs. Her general condition deteriorated rapidly. She became lethargic and almost comatose.

On August 5, 1959, she was readmitted because of the anasarca and hydrothorax. Her pulse was 120, blood pressure 200/100, hemoglobin 5.2 gm, hematocrit 18, NPN 130, fasting blood sugar 111, total protein 4.5, blood sodium 128 mEq/liter, potassium 5.4 mEq/liter, calcium 12mg, and phosphorus 10.8. The urine showed specific gravity 1.006 with a trace of albumin and sugar, 4-6 white blood cells, and red blood cells too numerous to count. X-ray films of the chest showed enlargement of the heart with suggested pericardial effusion and bilateral pleural effusion. The EKG showed myocardial ischemia and left ventricular hypertrophy. I tapped her chest and got 100 cc of clear fluid from the right side but only 50 cc from the left side. She lapsed into a deep coma and died August 10, age 44, nine years after the clinical onset of her disease.

Her husband refused an autopsy. I was particularly disappointed in not knowing whether or not she had cystic disease of the pancreas which may have caused diabetes.

POLYCYSTIC DISEASE OF THE KIDNEYS

Polycystic disease is the most prevalent renal cystic disease. It is inherited as a dominant non-sex-linked disease emerging clinically at two prominent age peaks, infancy and middle age. The progressive dilatation of the renal tubules leads to obstruction, infection, rupture of cysts, bleeding, or chronic renal faliure. Other associated anomalies, such as cysts in other organs and berry aneurysm of the cerebral arteries, may be present. Sporadic cases are found, but surveys in large families usually show that half of the members develop clinical signs of the disease. Often the adult disease emerges after the next generation has been planted.

No single theory of pathogenesis is generally accepted. Older theories such as fetal papillitis with secondary fibrosis and obstruction, cyst formation as a neoplastic process, congenital syphilis, and fetal interstitial nephritis no longer seem valid.

Bagg[1] has produced a polycystic kidney experimentally. He exposed the abdomen of one generation of mice to unfiltered irradiation and found in the third and fourth generation various congenital anomalies including polycystic kidney, horseshoe kidney, and renal aplasia. He proved that the tendency to these congenital renal anomalies was inherited as a Mendelian recessive. Research in this direction, in view of the widespread use of diagnostic and therapeutic irradiation and radioactive isotopes, may be rewarding.

The most tenable theory is the one first suggested by Felix[2] and elaborated by Kampmeier,[3] that the uriniferous tubules of certain generations fail to atrophy or reunite with the collecting tubules. Thus, a functioning glomerulus with no outlet produces multiple glomerular and tubular

cysts. The development of associated renal arteriosclerosis greatly influences the progression of polycystic disease and may be the major factor in the initial production of symptoms in adult life.

The pathologic appearance is unmistakable. The kidneys are enlarged and often asymmetrical. They have a nodular surface produced by projecting cysts which may be filled with water, serous, hemorrhagic, or viscid fluid, or clear urine. The cut surface shows the entire parenchyma honeycombed by cysts protruding from various levels. Cysts may coexist in the spleen, pancreas, lungs, and particularly in the liver, but are rarely clinically significant. Interruptions of the elastic laminae of small renal arteries, ruptured arteries, and microaneurysms are found in the renal parenchyma. Degenerative changes from pressure, calculi, and secondary infection may be present. Many cases of renal carcinoma and rare cases of papillary carcinoma have been reported in polycystic kidneys. An important fact to remember clinically is that 20% of polycystic cases have intracranial aneurysms, and 4% of patients with clinical cerebral aneurysms have polycystic disease.

Table 1

Associated Congenital Anomalies Encountered in 46 Cases of Polycystic Disease of the Kidney at Necropsy

Associated Congenital Anomalies	Cases	%
Polycystic liver	15	33
Polycystic pancreas	4	9
Polycystic spleen	1	2
Cardiac defects	4	9
Defects of nervous system	2	4
Genitourinary defects (other than polycystic kidney)	6	13
Defects of gastrointestinal tract	3	7
Defects of the musculoskeletal system	2	4
Total	37	81

Diagnosis of the infantile type is usually made by palpation of bilateral renal masses, by x-ray findings, or by development of uremic symptoms such as vomiting, dehydration, and abdominal distention. The adult type may be asymptomatic for many years and then may be only a chance finding on x-ray examination or autopsy.

The presenting complaints of the 207 cases collected at the Mayo Clinic by Rall and Odel,[4] which form the basis of all the tables shown, had the diagnosis verified by intravenous or retrograde pyelogram or examination of the kidneys at the time of operation or autopsy.

Table 2

Clinical Data Presenting Complaint or Findings

	Cases	%
Lumbar or abdominal pain	58	28
Presence of abdominal mass	42	20
Elevated blood pressure	35	17
Frequency, urgency or burning on urination	36	17
Painless hematuria	26	13
Hematuria and renal pain	21	10
Kidney failure (edema, uremia, etc.)	2	1
FINDINGS ON PHYSICAL EXAMINATION		
Elevated blood pressure (more than 140 mm Hg systolic or 90 mm diastolic)	146 (of 200)	73*
Palpable, enlarged kidney or kidneys	150 (of 207)	72†

*% of 200 cases in which blood pressure was recorded.
†% of 207 cases.

These symptoms include lumbar or abdominal pain in 28%; palpable mass in 20%; hypertension 17%; bladder symptoms such as frequency, urgency, and dysuria in 17%; painless hematuria in 17%; and painful hematuria in 10%. Some patients may appear with any of the manifestations of renal failure. Hypertension and palpable enlarged kidneys were present in about 75% of the patients at the time of diagnosis. Kidneys weighing 6 kg or more produce weakness, a dragging sensation, displacement of other organs, and increased abdominal girth. The pain present in 20% of the patients has no definite pattern. It was located in the lumbar region or upper or lower part of the abdomen and was usually nagging and dull but could be colicky. This more severe pain was usually caused by the passage of blood clots or calculi.

The most common laboratory findings are albuminuria, pyuria, and hematuria. Increased BUN in more than one third of these presenting patients indicates how long they were able to get along without azotemic symptoms. Kidney stones were found in 14%, suggesting that hyperparathyroidism secondary to long renal failure may be

Associated Nephrolithiasis	29	14

Fig 1

the cause. Of the 29 patients who had stones, only 11 had high BUN; and this is the same incidence of azotemia found in those without stones. Stagnation of urine and infection seem more likely to have caused the calculi (fig 1).

The important x-ray findings are enlarged or displaced kidneys with various densities, loculation or calcification, elongated pelves, crescentic deformities of calyces, hydronephrosis, and other obstructive phenomena. The infantile type of cyst is best diagnosed by observation of dye in the kidneys retained up to 72 hours.

Less than 10% of polycystic disease is unilateral. Complications of polycystic disease are varied. Many patients present or die with complications such as vascular accidents from ruptured cerebral aneurysms or hypertensive disease, secondary pyelonephrosis, infected cysts, perinephritic abscesses, gross hematuria, calcification of cyst walls, and formation of urinary calculi and renal carcinoma. Subdiaphragmatic abscesses from ruptured infected cysts have occurred.

The infantile type carries a poor prognosis. Infants die rapidly from uremia or complications. The adult type may be latent and may not shorten life. A local man known to have masses in both flanks at 68 had the diagnosis of polycystic disease made by IVP at 74, at which time his NPN was 34. He died at 82 of a stroke. But usually the disease is progressive and leads to hypertension, uremia, vascular accidents, and infection with death occurring in the fifth or sixth decade.

Life can be prolonged by continuous medical care and treatment of infection and acute obstruction, management of chronic uremia, and avoidance of or special care during pregnancy. The average age at death was 49.3 years, excluding those dying under six months of age. The average life after the onset of symptoms in a carefully followed series of 43 patients was 9.3. The 17 patients whose onset of persistent azotemia (BUN

Basilar meningitis	1	

Only 20% of the patients died directly from renal failure. Even if the deaths from the complications of the hypertension accompanying polycystic disease, such as myocardial infarction, cardiac failure, and cerebral hemorrhage, were excluded, the incidence was less than 50%.

At present, the treatment of polycystic disease is medical. Various surgical procedures such as marsupialization, bivalving with unroofing, puncture and aspiration, and unilateral nephrectomy have been tried and have failed. Decompression or heminephrectomy is justified only when extrarenal obstruction develops. Treatment of urinary infections and chronic renal failure must be carried out in polycystic disease just as in other renal diseases. Recent studies emphasize the futility of expecting cure of urinary infections when urinary tract obstruction is present, but they also point out that these infections can be controlled by continued use of antimicrobial drugs selected by tube sensitivity tests. Penicillin is still one of the most valuable drugs in this field. Gross hematuria should be treated by bedrest, and any significant anemia with transfusions. Careful management of the hypertension is essential.

Hemodialysis has been used successfully for transient exacerbations of renal failure caused by infection, obstruction, dehydration, or hypotension. It may occasionally result in prolonged improvement even in apparently moribund patients. The history of a recent good urinary volume is a good guide in selecting patients for dialysis. Peritoneal dialysis can also be used. It takes longer and its effects do not last as long, but it requires so little equipment and supervision that it can be done anywhere.

Treatment of the patient involves his family. If the patient has children, about half may develop the disease. The physician must handle this situation with great discretion so as to avoid producing excessive guilt on the part of the parent and blame on the part of the children. The children and siblings of the patient should be encouraged to have frequent examinations to detect the disease as early as possible.

Braddock Heights, Md

GENERIC AND TRADE NAMES OF DRUGS

Chloramphenicol—*Chloromycetin*
Chlorothiazide—*Diuril, Lyovac Diuril*
Chlorpromazine—*Thorazine*
Chlorpropamide—*Diabinese*
Meperidine—*Demerol*
Nitrofurantoin—*Furadantin*
Phenformin hydrochloride—*DBI*
Sulfisoxazole—*Gantrisin*
Tolbutamide—*Orinase*

when treatment might precipitate a problem with monilia

especially in diabetics or debilitated patients

and in patients with a history of fungal overgrowth—during pregnancy—patients on steroids who require antibiotics—the elderly. The antimonilial specificity of Nystatin plus the extra benefits of DECLOMYCIN Demethylchlortetracycline allow lower mg intake per dose per day, the option of b.i.d. dosage, higher activity levels, 1-2 days' "extra" activity.

Side Effects typical of tetracyclines include glossitis, stomatitis, proctitis, nausea, diarrhea, vaginitis, dermatitis, overgrowth of nonsusceptible organisms, tooth discoloration (if given during tooth formation) and increased intracranial pressure (in young infants). Also, very rarely, anaphylactoid reaction. Reduce dosage in impaired renal function. Because of reactions to artificial or natural sunlight (even from short exposure and at low dosage), patient should be warned to avoid direct exposure. Stop drug immediately at the first sign of adverse reaction. It should not be taken with high calcium drugs or food; and should not be taken less than one hour before, or two hours after meals.

Average Adult Daily Dosage: four divided doses of 1 capsule each or two divided doses of 2 capsules.

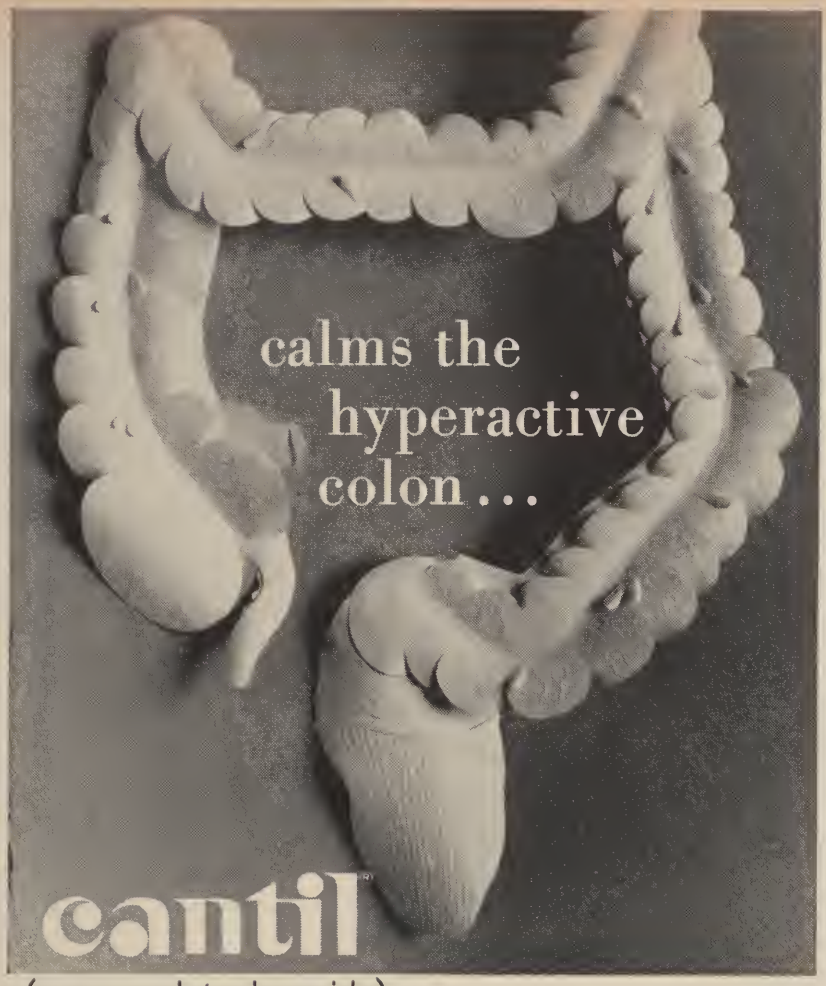
with the option of b.i.d. dosage

A case of nephrotic syndrome is reported. The cause has not been determined. Treatment has been of six years duration, and the patient's course has been complicated by signs and symptoms of cholecystitis, possible peptic ulcer, and possible hyperthyroidism. Excessive proteinuria continues despite almost five years of steroid therapy, but no other abnormalities of renal function have been demonstrated.

THE NEPHROTIC SYNDROME

HENRY V. CHASE, MD



This patient was selected as representative of the nephrotic syndrome for several reasons. First, she has been studied thoroughly, and close personal follow-up has extended over a period of six years. Second, the patient presents a number of features that provoke discussion. Her course has been most instructive and continues to be a challenge for the future.

CASE REPORT

The patient, a 37-year-old, white, married woman, was first seen on March 1, 1957. She complained of tiring easily. She dated the onset of her illness back to June, 1956, when she had developed a rather extensive contact dermatitis, eventually attributed to metal hypersensitivity. From July, 1956, to December of the same year, she was treated with steroids and developed edema of the lower extremities and elevation of blood pressure. Frequent upper respiratory infections associated with a persistent, hacking, nonproductive cough were noted. All of these disappeared when steroid therapy was discontinued.

Before June, 1956, her past health had been excellent. In 1942, during the last trimester of her only pregnancy, she had extensive swelling of both lower extremities. This cleared spontaneously after delivery. She was not told that she had any kidney trouble or elevation of blood pressure. Six years later, while living in California, she developed a lower urinary tract infection diagnosed by an urologist as cystitis. Cystoscopic examination was performed and no specific therapy was given. She made an uneventful recovery.

Her paternal grandfather was a diabetic, but there is no family history of allergy, thyroid trouble, tuberculosis, or kidney disease. Her father died of a coronary thrombosis at the age of 60. A system review revealed no significant information.

(mepenzolate bromide)

helps restore normal motility and tone

Cantil (mepenzolate bromide) works in the colon. In irritable colon, spastic colon, ulcerative colitis and other functional and organic colonic disorders, it acts to:

- control diarrhea/constipation
- relieve spasm, cramping, bloating
- make patients more comfortable

with little effect on stomach, bladder or other viscera.

"In 40 of 44 cases of irritable or spastic colon, Cantil [mepenzolate bromide] or Cantil with Phenobarbital reduced or abolished abdominal pain, diarrhea and distention and promoted restoration of normal bowel function . . . Cantil [mepenzolate bromide] proved to be singularly free of anticholinergic side-effects. Blurring of vision or dryness of the mouth were occasionally seen and were usually managed with a reduction in dosage. Urinary retention, noted in two cases was eliminated in one by reducing dosage."[1]

IN BRIEF:

One or two tablets three times a day and one or two at bedtime usually provide prompt relief. Cantil with Phenobarbital may be prescribed if sedation is required.

Dryness of the mouth or blurring of vision may occur but it is usually mild and transitory. Urinary retention is rare. Caution should be observed in prostatic hypertrophy—withhold in glaucoma. Cantil with Phenobarbital is contraindicated in patients sensitive to phenobarbital.

Supplied: CANTIL (mepenzolate bromide)—25 mg. per scored tablet. Bottles of 100 and 250.

CANTIL with PHENOBARBITAL—containing in each scored tablet 16 mg. phenobarbital (warning: may be habit forming) and 25 mg. mepenzolate bromide. Bottles of 100 and 250.

1-Riese, J.A.: Amer. J. Gastroent. 28:541 (Nov.) 1957

LAKESIDE LABORATORIES, INC.
Milwaukee, Wisconsin 53201

On initial physical examination, blood pressure was 150/90; temperature 99.4° (oral), weight 120 pounds, and pulse 70/min. She appeared older than the stated age of 37. Skin texture was normal. One spider nevus was found on the right arm, and there was a small area of healing erythematous rash on each of her fingers. The mucous membranes were moist and of good color; her hair appeared normal. The thyroid was not palpable. There were no palpable lymph nodes in any part of the body except for several shotty glands in the inguinal regions. Examination of the eyes was not remarkable except for a slight degree of exophthalmos and a questionable lid lag. The former has been present for many years and was considered a family trait. Her fundi appeared entirely normal. The pharynx was slightly injected but was otherwise unremarkable. Both breasts were fatty and without palpable lumps. There was no gross deformity of the chest cage. Lungs and heart appeared normal. The abdomen was flat, soft, nontender, without scars, and there were no palpable organs or abnormal masses. A fine tremor of the hands was noted. There was no peripheral edema, and the peripheral vessels were normal to palpation. Neurological examination revealed normally active and equal reflexes and no abnormal reflex was elicited. Careful rectal and pelvic examinations were entirely normal.

A routine voided urine specimen was normal except for 2+ albumin. A second specimen obtained at the end of the examination showed only a trace of albumin, and a third specimen collected the following day was negative for albumin. STS was negative. A complete blood count was normal, and a fasting blood sugar was 90 mg%. Chest x-ray and electrocardiogram were normal. The electrodes caused a rash to appear at the site of contact. No specific therapy was advised, and the dermatitis involving the fingers slowly healed completely.

In June, 1958, the patient developed a persistent cough which worsened at night. There was evidence of allergic rhinitis; when a cat was removed from the house, the cough quickly disappeared. During this time, the patient had all metal water pipes removed from her house and well. Plastic pipes were installed and the well was lined with tile. This was done by her husband at the suggestion of a friend who works with him at a nearby government installation.

Ankle swelling developed for the first time in April, 1959, upon the patient's return from a trip to California. The edema was extensive and extended up to the inguinal regions. Weakness and easy fatigability accompanied the swelling. At that time, her blood pressure was 120/80. Physical examination revealed no change except for the presence of a small cystlike lesion in the left breast. A rather large, movable mass was also found in the posterior cul-de-sac on pelvic examination. Urinalysis was normal.

The patient was referred to a gynecologist, and subsequently a laparotomy was performed. The mass was found to be an extremely large, pedunculated myoma. The entire uterus was removed together with the appendix. The adnexa was left undisturbed. Her postoperative course was uneventful. Routine laboratory findings during hospitalization were normal, and albuminuria was not observed in either of two urine specimens examined.

On August 19, 1959, the patient was seen again because of swelling of both lower extremities. She had no other complaints and felt well. Examination revealed enlargement of the liver and pitting edema of both ankles. Liver function tests were obtained, and the cephalin flocculation test was negative in 48 hours; BSP test, 2.5% retention of dye in 30 minutes; thymol turbidity was 4.5 units; total protein was 4.10 gm; albumin was 1.99, and globulin 2.11. Sedimentation rate was 40 mm/hr (Westergren); lupus erythematosus prep was negative. Urinalysis showed 4+ protein. A tentative diagnosis of nephrotic syndrome was made, and hospitalization was recommended for further evaluation.

The patient's husband requested that she be referred to the National Institutes of Health. On October 7, 1959, she was admitted to this institution and was discharged on November 16.

Following is a summary of laboratory data obtained while at the National Institutes of Health: hemoglobin 14.2 gm; RBC 4.9 million; hematocrit 44%; platelets 189,000; reticulocytes 0.4%; WBC 7,400; differential 48% mature polymorphonuclear leukocytes; lymphocytes 42%; monocytes 2%; eosinophils 8%; sedimentation rate 27; red cell indices: MCV 88, MCH 29, MCHC 33. Urinalysis: specific gravity 1.007; pH 6; Protein 2+; sugar negative; urinary sediment revealed a few red blood cells, a rare white blood cell, and rare hyaline casts. No doubly re-

more complete relief for the "dyspeptic"

DACTILASE®

Dactilase provides comprehensive therapy for a wide range of digestive disorders. Its antispasmodic and anesthetic actions rapidly relieve pain and spasm. Dactilase decreases hypermotility without inducing stasis. In addition, it supplies digestive enzymes to help reduce bloating, belching and flatulence. Dactilase does not interfere with normal digestive secretions. Very often it can be a most useful answer to the dyspeptic's needs.

DACTILASE: Each tablet contains: Dactil® (piperidolate hydrochloride), 50 mg.; Standardized cellulolytic* enzyme, 2 mg.; Standardized amylolytic enzyme, 15 mg.; Standardized proteolytic enzyme, 10 mg.; Pancreatin 3X** (source of lipolytic activity), 100 mg.; Taurocholic acid, 15 mg.

*Need in human nutrition not established. **As acid resistant granules equivalent in activity to 300 mg. Pancreatin N.F.

Side Effects and Contraindications: DACTILASE is almost entirely free of side effects. However, it should be withheld in glaucoma and in jaundice due to complete biliary obstruction.

Administration and Dosage: One tablet with, or immediately following each meal. Tablets should be swallowed whole.

Supplied: Bottles of 60 and 250.

LAKESIDE LABORATORIES, INC.
Milwaukee, Wisconsin 53201

fractile bodies were seen. Total urinary protein for a 24 hour period was 10.3 gm. Repeated examination of the urine revealed essentially the same values. VDRL was nonreactive; protein bound iodine 5.1 μg%; PSP test 41% excretion in 15 minutes and a total of 61% in two hours; BMR +3; LE prep, negative; bentonite flocculation test for rheumatoid arthritis, negative; bentonite flocculation test for lupus erythematous, negative. Total cholesterol was 463 mg%; total protein 4.6%; albumin 1.4; globulin 3.2; thymol turbidity 4 units; cephalin flocculation test 2+ at 24 hours; Van den Bergh 0.2 total, 0.02 direct; SGOT 13 units; fasting blood sugar 80 mg%; creatinine 0.6 mg; serum electrolytes, normal. Serum electrophoresis revealed a high alpha 2 globulin and high gamma globulin and low albumin. An Addis count revealed 500,000 casts; white blood cells 1,010,000; red blood cells 20,795,000. Stool: negative for occult blood, ova, and parasites. A voided urine culture revealed hemolytic Staph albus; coagulase, negative; diphtheroids and a colony count, 100/cc; prothrombin determination, normal; BSP was 1% residual in 45 minutes.

Electrocardiogram and chest x-ray were normal. A flat film of the abdomen showed an enlarged liver shadow and a large biliary calculus. Both hands and wrists appeared normal. Skull films were negative. The cervical spines appeared normal. An intravenous pyelogram showed generous sized kidneys with the right being slightly larger than the left; there were no deformities of the calyces.

Skin and muscle biopsy specimens were normal. A renal biopsy was performed on October 22, 1959. The specimen contained only four or five normal appearing glomeruli, and the sections were considered inadequate. The patient has persistently refused to submit to another renal biopsy.

After hospitalization, the patient was started on hydrochlorothiazide 50 mg twice daily. The discharge diagnosis was nephrotic syndrome due to undetermined cause.

The patient was observed closely during the next four months. Hydrochlorothiazide was continued and edema was controlled. Repeated urinalyses continued to show 4+ albuminuria; serum potassium remained normal.

Therapy with steroids was started on February 1, 1960. Prednisone 60 mg daily was the initial dose, and a maintenance dose of 20 mg daily was given after diuresis. She responded to this form of therapy with an adequate diuresis of ten pounds and a decrease in proteinuria from more than 10 gm daily to 8 gm in 24 hours. Within three weeks, she developed symptoms of acute cholecystitis, and glycosuria appeared.

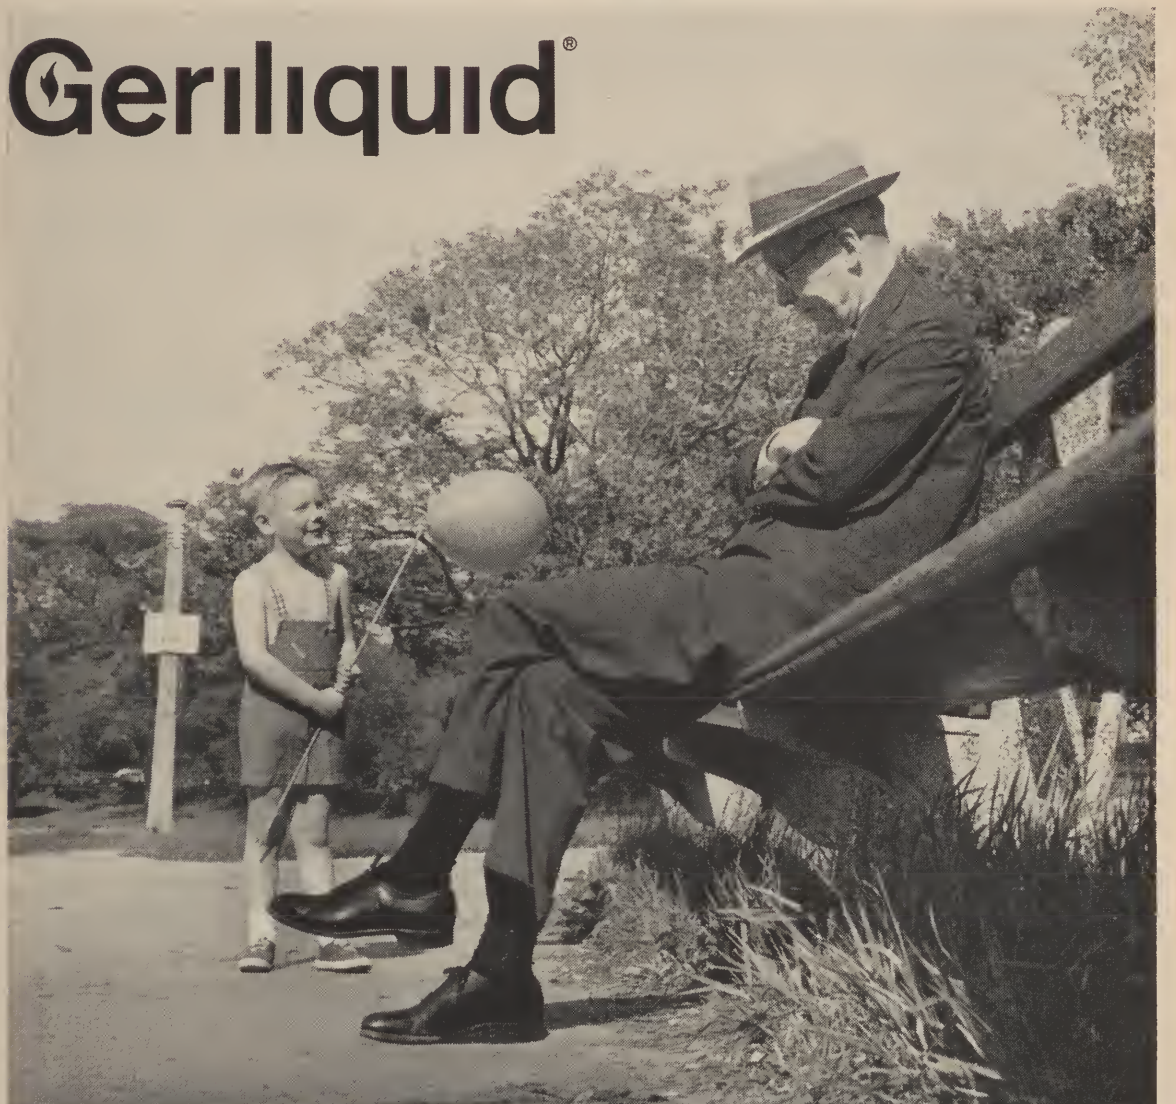
Examination revealed increase in the size of her liver and the presence of spider nevi on both arms. There was a good response to a low fat diet. Steroid therapy together with potassium chloride and hydrochlorothiazide were continued. A fasting blood sugar determination was 90 mg%.

Surgical consultation was indicated for the gall bladder disease and arrangements were made for admission to the Johns Hopkins Hospital. After a thorough workup, it was agreed that surgery was not indicated and that conservative, medical treatment should be continued.

Extensive laboratory investigations were again accomplished, but the results were the same as those obtained at the National Institutes of Health, except for the following: cholesterol 710 mg%; calcium 9.7 mg%, phosphorus 3.4 mg; alkaline phosphatase 4.6 units, total serum protein 5.8 gm; albumin 3.1 gm; globulin 2.1 gm; two hour p.c. glucose 78 mg%; Rose test: negative, ASO titre, 12 Todd units; PBI, 8.9 μg%; urea clearance showed 120% of normal in the first specimen and 85% of normal in the second specimen. Two quantitative 24 hour protein determinations were 5.1 and 4.6 gm/24 hours. Fishberg test showed a maximum concentration of 1.030; venous pressure was 90-100 mm of saline. A liver biopsy was performed and reported as normal.

The patient was discharged on prednisone 20 mg daily and was advised to continue a high protein, low fat diet. Antacids after meals and supplementary doses of potassium were also continued.

The consensus at the time of discharge was that the patient presented a picture of the nephrotic phase of glomerulonephritis.



In June, 1960, she developed hirsutism, moon facies, and marked increase in her appetite. By choice, she had always followed a high protein diet. Now she had to eat every two or three hours and would get up several times during the night to eat a fairly large meal. Prednisone was decreased from 20 mg to 15 mg daily. At this time it was noticed that albuminuria exceeded 10 gm/24 hours. Sodium intake was kept at a mini-

when even southern sun fails to warm cold hands and feet

provide rapid, sustained vasodilation for warmth and relief of pain, dizziness and faintness in patients with impaired peripheral circulation

GERILIQUID warms cold hands and feet through the thermogenic action of glycine and through sustained vasodilation by glycine and niacin. In addition, in patients with impaired peripheral circulation, GERILIQUID increases the ability to walk farther with less pain. Patients particularly like the palatable, sherry wine base.

Geriliquid®

IN BRIEF: Composition: Each 5 ml. contains: niacin 75 mg. and aminoacetic acid (glycine) 750 mg. in a palatable sherry wine base; alcohol 5%.

Side Effects: Occasional lightheadedness or transient itching which may disappear with continued use. There are no known contraindications; however, caution is advised when there is concomitant administration of a coronary vasodilator.

Administration and Dosage: One or two teaspoonfuls 3 times a day before meals. If flushing is objectionable, dosage may be lowered. However, tolerance to flushing usually develops without loss of efficacy in regard to vasodilation.

Supplied: Bottles of 8 oz. and 16 oz.

LAKESIDE LABORATORIES, INC. Milwaukee, Wisconsin 53201

mum, and edema seemed fairly well controlled, but her weight would vary eight pounds in a 24-hour period.

In September, 1960, she complained of easy fatigability, nervousness, palpitations, sweating, backache, weakness in both legs after climbing steps, tremor, and still more increase in appetite, postprandial epigastric distress, and well localized epigastric tenderness. A gastrointestinal series showed no evidence of an ulcer and was considered normal. A cholecystogram showed a single, large, radiolucent calculus which appeared to move freely within the gall bladder with fairly good concentration of the dye. Urinalysis showed 4+ protein (15 gm daily); trace of sugar; specific gravity 1.010, and negative microscopic. Two hour postprandial glucose was 117 mg%; total serum protein 4.6 with albumin 2 and globulin 2.6; alkaline phosphatase 3.8 units; BUN 10 mg%; LE prep, negative; stool, negative for occult blood; chest x-ray, negative.

A full ulcer program was started. The patient was put on a 3000 calorie, low sodium, low fat diet. The prednisone was decreased to 15 mg daily. This regimen brought about relief of most of her gastrointestinal symptoms. She remained free of edema, but excessive proteinuria continued and signs and symptoms of hypermetabolism became more apparent. A BMR could not be done because the patient could not cooperatve by rest and fasting. She refused to go without food for more than two hours. A butanol extractable iodine determination was 3.5μg% and an ET_3 test was 16.4% (normal range 10.3-14.3).

The patient was then seen in consultation by an endocrinologist because of possible hyperthyroidism. A PBI was 8.1 μg% (a cholecystogram had been performed in September, 1960) and an RAI uptake was 18% in two hours (normal 6-12%) and 52% in 24 hours (normal 15-40%); serum cholesterol 970 mg%; total serum protein 4.0; albumin 1.9; globulin 2.1. The consultant did not think she had hyperthyroidism, and this opinion was confirmed after special tests were done on the patient's serum to determine the level of free thyroxine. The changes in her RAI uptake were thought to be secondary to her protein abnormalities. No treatment for hyperthyroidism has been given, and the patient continues to follow a diet in excess of 3000 calories daily. She is inactive and rests four to six hours daily. Prednisone 12.5 mg daily was continued with no change in the amount of proteinuria. The dose of corticosteroid was decreased to 10 mg in February, 1962, and to 7.5 mg in May, 1962. She has been maintained on this dose during the past year and there has been little change in her overall condition. Moderate glycosuria continues. A recent blood sugar was 120 mg%, two hours postprandial. More recently, episodes of gall bladder colic have occurred. Propantheline and antacids have been continued and have given symptomatic relief.

DISCUSSION

The introduction of percutaneous renal biopsy[1] and the use of the electron microscope[2] in the study of antemortem biopsy material have increased our understanding of the nephrotic syndrome. As a result of these studies, a more workable classification of the syndrome has been devised, and it has become apparent that it is not a single disease entity but the metabolic expression of a wide variety of underlying diseases.

Definitions of the syndrome are numerous, but all include the hallmarks of proteinuria, hypoalbuminuria, hypercholesterolemia, and edema. Berman and Schreiner[3] would use proteinuria in excess of 3.5 gm daily together with the presence of fat bodies in the urine as the *sine qua non* of the syndrome. In a more recent publication, Schreiner[4] has reviewed the subject of nephrosis thoroughly. His bibliography of 895 articles reveals the complexity of the subject matter. Only a few facets of the disease will be mentioned in this discussion.

In most of the series reported, intrinsic renal disease accounts for the largest number of cases. Many of the patients who showed "normal glomeruli" by light microscopy have been found by electron microscopy to have certain characteristic changes in the basement membrane and epithelial cell layer of the capillaries. The epithelial cell foot processes in the glomeruli of these patients appear to be uniformly smudged. The podocytes (epithelial cells) show loss of pedicles (foot processes) with replacement by an abnormal layer of cytoplasm. The basement membrane may be of variable thickness, and vents or gaps in this membrane have been described by Spiro,[5] who considers this the structural basis of proteinuria. Earle, Jennings, and Bernik[6] have not been able to observe these defects or holes which are said to permit diffusion of proteins. These defects in the basement membrane have been observed in cases

WHEN MOTHER'S IRON ISN'T UP TO MOTHERHOOD

IN BRIEF: ACTIONS AND USES: A single dose of Imferon (iron dextran injection) will measurably begin to raise hemoglobin and a complete course of therapy will effectively rebuild iron reserves. The drug is indicated only for specifically-diagnosed cases of iron deficiency anemia and then only when oral administration of iron is ineffective or impractical. Such iron deficiency anemia may include: patients in the last trimester of pregnancy; patients with gastrointestinal disease or those recovering from gastrointestinal surgery; patients with chronic bleeding with continual and extensive iron losses not rapidly replenishable with oral iron; patients intolerant of blood transfusion *as a source of iron;* infants with hypochromic anemia; patients who cannot be relied upon to take oral iron.

COMPOSITION: Imferon (iron dextran injection) is a well-tolerated solution of iron dextran complex providing an equivalent of 50 mg. of elemental iron in each cc. The solution contains 0.9% sodium chloride and has a pH of 5.2-6.0. The 10 cc. vial contains 0.5% phenol as a preservative.

ADMINISTRATION AND DOSAGE: Dosage, based upon body weight and Gm. Hb./100 cc. of blood, ranges from 0.5 cc. in infants to 5.0 cc. in adults, daily, every other day, or weekly. The total iron requirement for the individual patient is readily obtainable from the dosage chart in the package insert. Deep intramuscular injection in the upper outer quadrant of the buttock, using a Z-track technique, (with displacement of the skin laterally prior to injection), insures absorption and will help avoid staining of the skin. A 2-inch needle is recommended for the adult of average size.

SIDE EFFECTS: Local and systemic side effects are few. Staining of the skin may occur. Excessive dosage, beyond the calculated need, may cause hemosiderosis. Although allergic or anaphylactoid reactions are not common, occasional severe reactions have been observed, including three fatal reactions which may have been due to Imferon (iron dextran injection). Urticaria, arthralgia, lymphadenopathy, nausea, headache, and fever have occasionally been reported. Initial test doses of 0.5 cc. are advisable.

PRECAUTIONS: If sensitivity to test doses is manifested, the drug should not be given. Imferon (iron dextran injection) must be administered by deep intramuscular injection only. Inject only in the upper outer quadrant of the buttock, not in the arm or other exposed area.

CONTRAINDICATIONS: Imferon (iron dextran injection) is contraindicated in patients sensitive to iron dextran complex. Since its use is intended for the treatment of iron deficiency anemia only, it is contraindicated in other anemias.

CARCINOGENICITY POTENTIAL: Using relatively massive doses, Imferon (iron dextran injection) has been shown to produce sarcoma in rats, mice and rabbits and possibly in hamsters, but not in guinea pigs. The risk of carcinogenesis, if any in man, following recommended therapy with Imferon (iron dextran injection) appears to be extremely small.

SUPPLIED: 2 cc. ampuls, boxes of 10; 5 cc. ampuls, boxes of 4; 10 cc. multiple dose vials.

in iron deficiency anemia for rapid and predictable replacement of iron reserves

imferon®

(iron dextran injection)

LAKESIDE LABORATORIES, INC. • Milwaukee, Wisconsin 53201

of so-called pure lipoid nephrosis, membranous glomerulonephritis, and subacute and chronic glomerulonephritis.

It is interesting to speculate as to the changes that may be present in the basement membrane and podocytes of the "normal glomeruli" reported in the renal biopsy of the case under discussion. One recognized authority suggested that the patient is in the nephrotic phase of glomerulonephritis. A more precise diagnosis of membranous glomerulonephritis probably could have been made with the electron microscope. This points up the need to subject so-called negative renal biopsies to examination by the electron microscope in the case of the idiopathic nephrotic syndrome.

The patient's exquisite sensitivity to metals and other allergens, such as cat hair, calls to mind other causes of the nephrotic syndrome. Various toxic and allergic agents have been incriminated. Relatively recent reports mention organic mercurials, inorganic mercurials, tridione, paradione, bismuth, trichlorethylene, probenecid, perchlorate, and tolbutamide, as possible toxic causes. Poison oak, bee sting, and snake venom have also been reported as precipitating allergic factors.

Of the generalized disease processes associated with the condition, amyloidosis, both primary and secondary, systemic lupus erythematosis, multiple myeloma, and diabetic glomerulosclerosis have been reported. Raisz and coworkers,[7] with the help of percutaneous renal biopsy, have helped to clarify the place of amyloidosis in the spectrum of renal disease, particularly in the differential diagnosis of the nephrotic syndrome. Seventeen patients with amyloidosis were studied, and 10 were found to have the syndrome. Their course was that of rapid progression of renal failure. The rare case of clinical remission in this situation is invariably the result of treatment of reversible diseases such as tuberculosis, chronic suppurative processes, myxedema, and rheumatoid arthritis. Four of the five cases of primary amyloidosis in the series manifested themselves as the nephrotic syndrome.

In 1842, Rayer[8] first described seven cases of renal vein thrombosis, two of which were associated with the nephrotic syndrome. This association has been reported with increasing frequency. The renal vein thrombosis may be seen as a localized process, but it is usually associated with thrombosis or obstruction of the inferior vena cava. Morris, Ginn, and Thompson[9] described a case in an adult and emphasized the need for diagnostic inferior venacavogram in any patient with back pain and thromboembolism before closed renal biopsy is performed. They also found that the renal histologic picture of the syndrome in renal vein thrombosis is the same as that seen in membranous glomerulonephritis. Kowal, Figur, and Hitzig[10] used anticoagulants to treat a 53-year-old woman with this condition and were able to bring about a complete remission of the nephrotic syndrome.

Other mechanical causes of the nephrotic syndrome are constrictive pericarditis, congestive heart failure, and congenital heart disease. Pregnancy rarely coexists with the nephrotic syndrome. Silberman and Adams[11] state that the pregnancy may proceed successfully without altering the mode of management of either condition.

Various infections are known to be associated with the nephrotic syndrome; syphilis, malaria, subacute bacterial endocarditis, and tuberculosis have been reported. Robins and Ladd[12] recently published a case in which the nephrotic syndrome developed as an acute disorder during the secondary stage of syphilis. Scott and Clark[13] have described a patient with the syndrome which appeared after a Herxheimer reaction with penicillin therapy. Infectious mononucleosis may be complicated by the nephrotic syndrome. Greenspan[14] recently reported such a case, and the excessive proteinuria cleared completely after two courses of steroid therapy.

The onset of signs of the nephrotic syndrome may take place at or immediately after birth. Oliver[15] has suggested that the basic lesion in infantile nephrosis lies in the development of the nephron. Worthen[16] and his associates have shown that the disease may be familial. Electron microscopic examination of biopsy material from their patients revealed changes in the podocytes identical with those seen in the nephrotic syndrome in older patients.

This patient's clinical picture has suggested, from time to time, the possibility of hyperthyroidism. Her intake has consistently exceeded 3000 calories daily. She rests for long periods during the day and sleeps at least 10 hours each night but has failed to gain weight. Tachycardia, palpitation, hyperactivity, easy fatigability, fine tremor

the price of "success"

190/102

Hypertension has been called the price of success... and in some life-situations, the cost of failure. In either event, Metatensin lowers blood pressure, cushions the patient against stress and retards the progress of disease. Metatensin is effective and economical. It is well-tolerated over long periods.

THERAPY
YOU CAN STAY
WITH

METATENSIN®

EACH SCORED TABLET CONTAINS:
Metahydrin® (trichlormethiazide) 2 mg. or 4 mg. Reserpine 0.1 mg.

In Brief: Patients with hepatic cirrhosis or diarrheal syndromes, or under therapy with digitalis, ACTH, or potassium-losing steroids, should be observed for signs of hypokalemia. With thiazides, electrolyte depletion, diabetes, gout, granulopenia, nausea, pancreatitis, cholestatic jaundice, flushing, mild muscle cramps, constipation, photosensitivity, acute myopia, perimacular edema, paresthesias, neonatal bone marrow depression in infants of mothers who received thiazides during pregnancy, skin rash or purpura with or without thrombocytopenia, may occur. With reserpine, untoward effects may include depression, peptic ulcer and bronchial asthma. Withdraw medication at least 7 days prior to electroshock therapy, 2 weeks prior to elective surgery. Contraindications are complete renal shutdown, rising azotemia or development of hyperkalemia or acidosis in severe renal disease.
Supplied: Metatensin tablets, 2 mg., 4 mg. — bottles of 100 and 1000.

LAKESIDE LABORATORIES, INC. Milwaukee, Wisconsin 53201

of tongue and fingers, excessive sweating, warm, moist palms, diarrhea, and slight but definite exophthalmos help to keep the impression of a hypermetabolic state constantly in mind. I cannot find a case of hyperthyroidism and the nephrotic syndrome reported in the literature. In fact, patients with the nephrotic syndrome usually have a low PBI and low BMR. One BMR determination early in the course of the disease was reported as 3+. Also, as in this case, the radioactive uptake may be normal to high.

The low PBI could, in part, be due to excessive renal loss of thyroxine. Recant and Riggs,[17] however, consider this loss insufficient to account for the low serum iodine concentration. They found that the thyroxine binding capacity of plasma proteins was low in nephrotics and that a normal supply of thyroxine was delivered to the peripheral tissues and degradation rates were normal. The low BMR could be explained by a severe body protein deficiency.

Rasmussen,[18] using I^{131} labeled thyroxin, found a lower than normal degradation rate and concluded that this could explain the low BMR in these patients. Robbins, Rall, and Petermann,[19] by studying nephrotic sera, have demonstrated that thyroxin interacts chiefly with an interalphaglobulin, designated TBP (thyroxin-binding protein), albumin, and a third protein. Ingbar[20] has recently described this third protein and called it TBPA (thyroxin-binding prealbumin). It is said to have four times the thyroxin-binding capacity of TBP. Both TBP and TBPA are reduced in most nephrotic patients, which could account for the low PBI.

Since nephrotic patients are invariably euthyroid in the presence of a low PBI and low BMR, it is difficult to correlate the existence of hyperthyroidism except that the thyroid gland may conceivably become hyperactive in order to compensate for the continuous loss of hormone in the urine.

In 1950, Barness, Moll, and Janeway[21] listed 64 different lines of treatment used for the nephrotic syndrome between 1926 and 1948. Shortly thereafter, Farnsworth[22] reported 14 cases of the syndrome which had been treated with ACTH. She observed that children responded to the hormone much better than adults, and two children had complete remissions.

Nitrogen mustard and ACTH have been used with beneficial effects in lipoid nephrosis. Nitrogen mustard alone in treating children with the nephrotic syndrome has given poor results. Combined steroid and nitrogen mustard therapy has been used in 10 patients by Talamo and Crawford.[23] Six showed a favorable response. A small group of patients with idiopathic nephrotic syndrome has been treated with 6-thioquanine. The antimetabolite lowered gamma-globulin levels; interruption of an autoimmune process was postulated.

The patient reported has shown little or no real response to steroid therapy. Fishberg[24] has seen few recoveries from the nephrotic syndrome in adults and never in a patient above the age of 40.

Ross and Smith[25] recently attempted to assess the effectiveness of steroids in the treatment of the nephrotic syndrome. They conclude that no specific therapy is available. The usual therapeutic approach is to render the patient free of edema with diuretics, aldosterone antagonists, or cation-exchange resins and then attempt the abolition of proteinuria with glucocorticoids. They treated 26 patients with this regimen; five became entirely free of proteinuria, while six responded with a reduction of proteinuria to less than one gm/liter, and the remaining 15 showed no response. Nesson and coworkers[26] had similar results. Twenty per cent of 42 adult patients had complete remission of proteinuria on steroid therapy, 52% of the remaining patients showed no response, while 14% went on to have a spontaneous cure after showing no decrease in proteinuria while on corticosteroids. It is encouraging to note that failure to respond promptly to steroids did not preclude the possibility of later spontaneous remission. It is hoped that this may occur to the patient who is the subject of this report.

approximating the diuretic efficacy of meralluride

METAHYDRIN®

(trichlormethiazide)

To determine the relative efficacy of thiazide diuretics in congestive heart failure, Metahydrin (trichlormethiazide) and three other thiazides were measured against Mercuhydrin® (meralluride injection)—the standard diuretic. "The results leave little doubt that the diuretic efficacy, that is, the 'ceiling effect' in these terms, is not the same for different thiazides."* The assays ranged from about 40% of the effectiveness of Mercuhydrin through 67%, 77% to 90% for Metahydrin. The latter two values were thought to be significantly different from the lowest value and to be therapeutically important.

LAKESIDE LABORATORIES, INC.
Milwaukee, Wisconsin 53201

IN BRIEF: ADMINISTRATION AND DOSAGE: One 2 mg. or 4 mg. tablet once or twice daily. In acute, severe decompensation, Mercuhydrin® (meralluride injection) may be necessary initially.

PRECAUTIONS: As with all effective diuretics, vigorous therapy may produce electrolyte depletion. Patients with severely reduced renal function should be observed carefully since thiazides may be contraindicated. Care should be taken with patients predisposed to diabetes or gout. Patients with a tendency to potassium deficiency, as in hepatic cirrhosis or diarrheal syndromes, or those under therapy with digitalis, ACTH, or certain adrenal steroids, also should be watched carefully.

SIDE EFFECTS: Nausea, flushing, constipation, skin rash, muscle cramps and gastric discomfort have been occasionally noted; rarely thrombocytopenia and bone marrow depression, photosensitivity, cholestatic jaundice, pancreatitis, perimacular edema, gout and diabetes have been caused by administration of thiazides.

CONTRAINDICATIONS: Complete renal shutdown; rising azotemia or development of hyperkalemia or acidosis in severe renal disease; demonstrated hypersensitivity.

HOW SUPPLIED: Bottles of 100 and 1000 tablets.

a rapid lift from the hell of depression

Doré Illustration
from
Dante's Inferno

often relieves mental pain in 2-5 days

NORPRAMIN®
(desipramine hydrochloride)

Norpramin is a rapid-acting specific drug for the treatment of depression. Depressive signs and symptoms—sometimes described as "mental pain"—typically begin to improve in 2-5 days. Patients are more hopeful, less empty and less weighed down by their troubles. Norpramin has only slight sedative qualities, nevertheless anxiety *secondary to depression* is frequently relieved as depression is lifted. If anxiety or tension persists it can be controlled by adding a tranquilizer or by reducing dosage. Norpramin is not a MAO inhibitor. Side effects are usually mild.

DOSAGE AND ADMINISTRATION

Optimal results are obtained at a dosage of about 150 mg./day—two 25 mg. tablets t.i.d. After achieving optimal results, a maintenance dose (50-100 mg./day) should be sought.

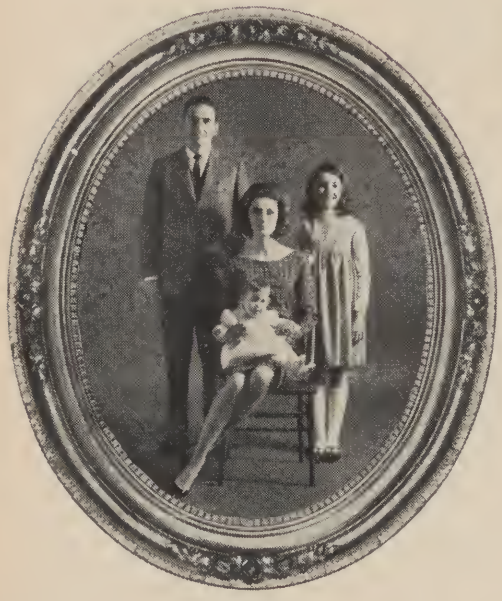
LAKESIDE LABORATORIES, INC. Milwaukee, Wisconsin 53201

IN BRIEF:

Indications: In depression of any kind—neurotic and psychotic depressive reactions; manic-depressive or involutional psychotic reactions.

Contraindications and Precautions: Glaucoma, urethral or ureteral spasm, recent myocardial infarction, severe coronary heart disease and epilepsy. Should not be given within two weeks of treatment with a monoamine oxidase inhibitor. Safety in human pregnancy has not been established.

Adverse Effects: Side effects, usually mild, may include: dry mouth, constipation, dizziness, palpitation, delayed urination, "bad taste," sensory illusion, tinnitus, agitation and stimulation, sweating, drowsiness, headache, orthostatic hypotension, flushing, nausea, cramps, weakness, blurred vision and mydriasis, rash, allergy, transient eosinophilia, granulopenia, altered liver function, ataxia and extrapyramidal signs.



Supplied: Norpramin (desipramine hydrochloride) tablets of 25 mg., in bottles of 50, 500 and 1000.

Turn a bundle of colic

into a bundle of joy

COLIC, often in part a reflection of family tension, adds sleepless nights to patients' and parents' distraught days. Pediatric Piptal with Phenobarbital slows down spasm, diminishes pain and crying, improves feeding patterns . . . permits sleep and rest . . . for patient and family.

Pleasant tasting Pediatric Piptal with Phenobarbital is miscible in milk, formulas and fruit juices, and may also be administered by dropper directly on the infant's tongue. Dosage is 0.5 cc. 15 minutes before feeding; in severe cases, 1.0 cc. four times daily. High doses may occasionally cause constipation with tenesmus and, rarely, flushing without fever. Contraindicated in bowel obstruction or sensitivity to phenobarbital or anticholinergics. Available in 30 cc. dropper bottles, droppers calibrated to deliver 0.5 cc.

PEDIATRIC PIPTAL® WITH PHENOBARBITAL

each cc. contains: 6 mg. phenobarbital (warning: may be habit forming); 4 mg. Piptal® (pipenzolate bromide), and 20% alcohol in a pleasant-tasting solution.

LAKESIDE LABORATORIES, INC.
Milwaukee, Wisconsin 53201

Prompt relief of pain and spasm in functional g.i. distress...

PIPTAL® (pipenzolate bromide) efficiently suppresses acid secretion and motility ... relieves pain and spasm of peptic ulcer. Despite its potent gastrointestinal effects, "its clinically effective therapeutic dose is well below that required to produce side reactions."[1] Because urinary retention is rarely a problem, PIPTAL (pipenzolate bromide) is "a highly desirable drug in the treatment of peptic ulcer in older patients ..."[2] Tolerance to PIPTAL (pipenzolate bromide) has not been demonstrated, and the drug may be administered over prolonged periods without loss of efficacy. *PIPTAL-PHB is specifically designed for the tense ulcer patient who will benefit from the sedative effect of phenobarbital.*

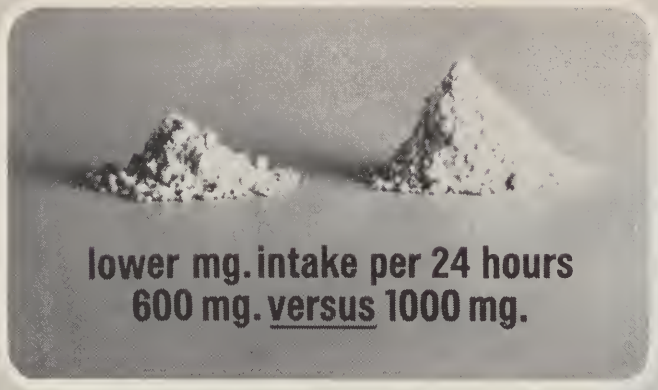
PIPTAL®
(pipenzolate bromide)

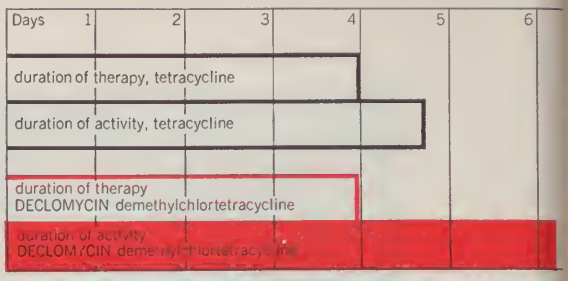
PIPTAL®-PHB
(phenobarbital, 16 mg., pipenzolate bromide, 5 mg.)

IN BRIEF: PIPTAL—Each tablet contains 5 mg. pipenzolate bromide, PIPTAL-PHB—Each tablet (or 5 cc. of elixir) contains phenobarbital (warning: may be habit forming) 16.0 mg., Piptal (pipenzolate bromide) 5 mg. The elixir contains alcohol 20%.



Side Effects: Dry mouth, blurring of vision or drowsiness may occur.

Contraindications: Withhold in glaucoma, bladder or g.i. obstruction, cardiac arrhythmias and in sensitivity to anticholinergics or phenobarbital (Piptal-PHB). Caution should be observed in patients with prostatic hypertrophy.



Administration and Dosage: PIPTAL or PIPTAL-PHB Tablets: One tablet three times a day before meals and one or two tablets at bedtime. (PIPTAL-PHB Elixir: One teaspoonful three or four times daily for adults and children over six years of age.)

Supplied: PIPTAL (pipenzolate bromide) 5.0 mg. Tablets—bottles of 100. PIPTAL-PHB Tablets—bottles of 100. PIPTAL-PHB Elixir—bottles of 8 fluid ounces.

LAKESIDE LABORATORIES, INC. Milwaukee, Wisconsin 53201

Urine Specific Gravity and Renal Function

ROBERT J. FURIE, MD

The determination of urine specific gravity is a fine means of assessing renal function. Though simple to perform and requiring simple preparation, the measurement of urinary specific gravity remains one of the best tests available to the physician in need of analyzing the renal function of a patient.

There is merit in examining the situation which makes urinary specific gravity so valuable a procedure. The urine collected from the bladder represents a product which has undergone many alterations in the course of production.

Initially, the circulating blood (approximately 450 gallons of blood pass through the kidneys each day) traverses the glomeruli, which form about one square yard of filter surface.

Obviously, the numerous factors concerned with an adequate filtration pressure must be in order to insure the formation of filtrate. The pressure relationships of arterial pressure, osmotic pressure, capsular pressure, renal interstitial pressure, and intratubular pressure must be properly maintained, not to mention the anatomic integrity of the glomeruli.

Assuming that all the glomerular features are operative, the filtrate which forms will total some 45 gallons each day. At this stage, the filtrate will have about the same specific gravity as plasma, or about 1.007 or 1.008. Lying ahead for this glomerular filtrate are about one and a half to two million tubules which aggregate a linear measurement of about 40 miles.

The proximal convoluted tubules will avidly re-

The specific gravity urine concentration test has a leading position in the tests available for assessment of renal function. Informative, inexpensive, and uncomplicated, it can be recommended highly in all phases of the practice of medicine. Only in the small percentage of patients who cannot concentrate to 1.025 do other renal function tests become important.

absorb many essential metabolites and water and secrete some others.

In the descending loop of Henle, there is passage of water from the tubular lumen into the interstices without loss of sodium; while at the loop and ascending limb of Henle, there is a selective transfer of sodium from the tubule to the interstices.

As the urine proceeds to the distal convoluted tubules, the specific gravity is low (below 1.007-1.008). This state of affairs presents a dilute urine to the distal and collecting tubules and leaves the final decision on the production of a concentrated or dilute urine up to the posterior pituitary gland and antidiuretic hormone (ADH).

If there is need for water in the body metabolism, the ADH causes tubular reabsorption of water in the distal and collecting tubules. In this manner, a urine with high specific gravity is produced. The converse is true when water is not needed and ADH fails to act on the tubules, thus causing water loss and a dilute urine.

A moment's reflection of the great number of features which must be operative in order to produce a concentrated urine will explain the good correlation between the test and the results from more complicated and sophisticated tests.

In an analysis of 5,000 urine concentration tests performed before excretory urography, about 86% had urinary specific gravity measurements of 1.025 or higher. The specific gravity was measured after fluids were withheld for 16 to 18 hours. Invariably, patients manifesting a urinary specific gravity of 1.025 or higher had normal renal function when evaluated by endogenous creatinine clearances, PSP excretion tests, or intravenous urograms.

This reliable test has been traditionally performed with a hydrometer. Yet, through faulty equipment or faulty technique, the results have not always been reliable. When hydrometers are used to measure urine specific gravity, they should be calibrated. At a temperature of 16° C (60° F), distilled water should give a reading of 1.000; 0.85% (W/V) sodium chloride solution should read 1.006; and 5% (W/V) sodium chloride should give a reading of 1.035. The calibration should be performed at these three points to insure the accuracy of the hydrometers over the entire range of readings.

A correction should be made in hydrometer readings for temperature. For each three degrees above 16° C, .001 unit should be added to the observed measurement. That this feature cannot be ignored is readily apparent when a reading of a urine at body temperature (freshly voided specimen) of 37° C is compared with a reading at 16° C. One must add .007 units (37° C — 16° C = 21° divided by 3 = 7 units) to the observed value at 37° C to make it comparable to the reading at 16° C. Thus a reading of 1.018 at 37° C represents a true value of 1.025 at 16° C.

Other corrections that are necessary are those referable to proteinuria and glycosuria. In the presence of 1% glucose in the urine, .004 units should be subtracted from the observed hydrometer value. When proteinuria is present, a subtraction of .003 units is necessary for each 1% of protein.

Care must be taken not to perform the specific gravity-urine concentration test while the patient is in the process of eliminating high-density contrast medium used in urography. The presence of these contrast substances may raise the urine specific gravity to 1.070 for several hours after the excretory urogram.

A relatively inexpensive instrument is available for the determination of urine specific gravity which obviates many of the problems presented by the hydrometer. The hand refractometer, or T-S Meter, permits the performance of urine specific gravity with variations of .001 unit. Since the instrument is temperature compensated, no correction for temperature need be made. Since only two drops of urine are necessary, this determination can be performed on urine specimens of small volume.

Manufacturers of ethical pharmaceuticals since 1856

On Stelazine® brand of trifluoperazine
she's calm and alert

When a tranquilizer is needed, 'Stelazine' can regulate the level of anxiety so that the patient is unlikely to overreact to stress but is not tranquilized into psychic inertia. Patients on 'Stelazine' often experience a sense of mental alertness and, because they feel so much better, are more interested in their normal activities.

Contraindicated in comatose or greatly depressed states due to CNS depressants and in cases of existing blood dyscrasias, bone marrow depression and pre-existing liver damage. *Principal side effects,* usually dose-related, may include mild skin reaction, dry mouth, insomnia, fatigue, drowsiness, dizziness and neuromuscular (extrapyramidal) reactions. Muscular weakness, anorexia, rash, lactation and blurred vision may also be observed. Blood dyscrasias and jaundice have been extremely rare. Use with caution in patients with impaired cardiovascular systems.

Before prescribing, see SK&F product Prescribing Information.

A case of renal medullary necrosis is reported. This case represents some characteristic features of the disease.

Renal Medullary Necrosis

RICHARD C. REYNOLDS, MD

Renal medullary necrosis, as the name implies, is an ischemic necrosis of the medulla of the kidney. Infection of the ischemic portion of the kidney occurs, and clinically the course of illness resembles a malignant pyelonephritis with rapidly diminishing renal functions, oliguria, and uremia. It is commonest in the elderly, the diabetic, individuals with obstructive uropathy, and sometimes is associated with the chronic use of analgesics. Necrotizing papillitis, necrotizing pyelonephritis, and renal papillary necrosis are other names used to describe this disease. Formerly a pathologic diagnosis only, this condition can now be recognized antemortem by means of judicious use of renal biopsies and retrograde pyelography. Early diagnosis is important, as improved antibiotics for gram negative infection has made possible the successful treatment of renal medullary necrosis.

The following case history represents the first description of renal medullary necrosis in a patient from Frederick Memorial Hospital.

An 80-year-old white woman was admitted to the urological service because of gross hematuria of three weeks duration. Other urinary symptoms were urgency, frequency, and dysuria. Cystoscopic examination performed the day before admission revealed a large clot in the bladder and the suggestion of a bladder tumor. The patient had had vague, generalized abdominal pain for 20 years. Numerous x-ray studies of gastrointestinal tract were normal. The symptoms did not respond to antacids, antispasmodics, or sedation. The patient consumed large quantities of non-narcotic analgesics, but it was impossible to estimate the quantity. At times psychiatric hospitalization for eight month intervals was necessary with brief remissions in her hypochondriasis. The uterus and gall bladder had been removed several decades previously.

Physical examination at time of admission revealed an elderly, senile lady with no evidence of weight loss. Blood pressure was 200/100. Cataract operations had been performed on both eyes. No nodes were palpable. Lungs were clear. Heart was normal in size with regular rhythm and no murmurs. The abdomen was soft. No organs, masses, or tenderness was noted. Pelvic examination revealed a senile vaginitis and clean cervix. All peripheral pulsations were present, but the vessel walls were thickened and sclerotic.

Two days after admission, cystoscopic examination demonstrated a large bladder tumor occluding the left ureteral orifice. The tumor was partially resected transurethrally. On pathologic section, the tumor was reported as a squamous cell car-

cinoma. After surgery the hemoglobin fell to 9.0 gm. Two days after surgery, the patient was given a blood transfusion. After receiving 250 cc of whole blood, she had a grand mal seizure and mental confusion for the following 12 hours, and her temperature rose to 103.2° F.

Serum urea nitrogen on admission was 15 mg%. The day after the transfusion reaction it had risen to 40 mg%. Urine cultures obtained before surgery and again from bladder urine during surgery were negative. Two days after the transfusion, pseudomonas was isolated from the urine in excess of 100,000 colonies per milliliter of urine and was resistant to all antibiotics.

Unfortunately the bladder irrigating fluids confused the measurement of urine output, but at no time was it greater than 200 cc a day. For the next 14 days after the transfusion, the patient remained oliguric. She received 500 mg of chloramphenicol daily. Careful fluid balance was maintained. She did not go into heart failure. She remained alert until three days before death. The temperature did not go higher than 100.2° F. Her serum urea nitrogen rose to 158 mg%, and the serum potassium to 5.8 mEq/l 48 hours before death. There was no inclination to diuresis at any time, and she died on the fourteenth day of oliguria.

Two different reference laboratories recognized an Anti-Kell antibody in the patient's serum compatible with the transfusion reaction. The most striking pathologic lesion was "suppurative exudate infiltrating the renal parenchyma and extending from the medullary portion to the cortex. There is also a necrotizing papillitis in which there appears to be infarction necrosis and suppuration of the pyramids." There was no pathologic evidence in the kidney sections of a transfusion reaction.

Some important features of renal medullary necrosis are described in this history. The patient was elderly and arteriosclerotic. She had a bladder carcinoma that required surgery and instrumentation of the urinary tract. The bleeding from the lesion initially and after surgery caused anemia, increasing the ischemia of the kidney. Infection of urinary tract followed instrumentation and undoubtedly precipitated the illness responsible for the patient's death. The patient had a transfusion reaction which resulted in oliguria and helped to compromise further the circulation of the kidney. At autopsy, however, the kidney showed only rampant infection and necrosis of the medullary portion without any anatomic evidence of renal damage from the transfusion reaction. The initial oliguria may well have been caused by the transfusion reaction, but its persistence and the death of the patient in uremia is attributable to the infection and necrosis of the renal medulla.

The patient was a long time user of over-the-counter analgesics. Phenacetin, when ingested in large doses for long periods, has been reported to be nephrotoxic and to cause an interstitial nephritis.[1] Renal medullary necrosis has also been seen in heavy users of phenacetin either alone or in combination with the interstitial nephritis.[2] A 25% incidence of necrosis of renal papillae has been described at autopsy in patients with rheumatoid arthritis and indirectly related to the frequent and prolonged use of analgesics encouraged by this illness.[3] There appears to be a direct relationship between the amount of drug consumed and the incidence of renal damage. If ten APC tablets are taken every day for 14 years, approximately 75% of the patients will show a decrease in renal function.[4] Whether the kidney dysfunction is the result of phenacetin or the other drugs with which it frequently is combined is still unknown, but there appears to be an increased incidence of kidney damage, including renal medullary necrosis, associated with long term use of analgesics containing phenacetin.

Recently an excellent review of renal medullary necrosis by Lauler et al has summarized the clinical features of 250 cases which have been reported in the literature until 1960.[5] Fifty-four per cent of these patients were over 60, but 90% were over 40 years of age. Twice as many patients were women. Diabetes was present in 57% and almost invariably was poorly controlled. Most patients were seen initially for urinary tract sepsis. Sixty-four per cent of the deaths were attributable to uremia. Catheterization and obstructive uropathy were common among the patients studied. Diagnosis before death was established in 13% of the cases. Only 18 of the 250 patients survived.

The greatest aid to diagnosis is an awareness of the illness and a familiarity with the clinical setting in which it occurs. Any fulminating urinary tract infection occurring in an elderly person, frequently a diabetic, and usually associated with rapidly diminishing urinary output, strongly suggests

COMPARE

Nursing homes are not all alike! And instead of little things, it's often big things that make the difference—Big things like those listed below. A point-by-point comparison will show you why the Convalesarium has been recommended by so many leading physicians!

- Under-building Free parking for visitors & doctors
- Physio & Occupational Therapy—under licensed Therapist

The Gould Convalesarium

6116 BELAIR ROAD **PHONE 426-1424**

BALTIMORE, MD. 21206

the possibility of renal medullary necrosis. A history of urinary tract instrumentation is common, along with lesions causing urinary tract obstruction. Diabetes, when present, is poorly controlled. Frequently the features of gram negative bacterial sepsis will overshadow the other aspects of the illness. The patient may experience ureteral colic as the necrotic papillae are sloughed and attempt to pass through the ureter.

Conclusive diagnosis is established by the recovery of necrotic papillae in urine. This is accomplished by straining the urine in the same manner one looks for a kidney stone. The discarded papillae are easily recognized under the microscope. Renal biopsy, which may be indicated if the cause of renal failure is obscure, will give proof of diagnosis. Pyelography gives suggestive evidence of renal medullary necrosis, as the destruction of the papillae results in a haziness and sinus tract formation in the region of the papillae, giving rise to a characteristic "ring" shadow.

Treatment is directed at the infection and any associated illness. Urine culture with drug sensitivities of the infecting bacterium are imperative in order to select the proper antibiotic. Bactericidal drugs such as colistin, cephalothin, and kanamycin should be used preferably over bacteriostatic drugs. Frequently more than one microorganism will be cultured from the urine. Quantitative bacteriology will help to separate the pathogens from the contaminants. A positive blood culture will frequently identify the pathogen responsible for the sepsis, originating from the urinary tract infection. Urinary obstruction must be relieved, diabetes controlled, and adequate hydration and urine output maintained.

Flagyl destroys trichomonads
here & here & here & here
No topical treatment can

Flagyl®
brand of
metronidazole

Flagyl eliminates the difficulties and frustrations that have long attended the treatment of trichomonal infection.

These difficulties arose mainly from:

1) the failure of any previously known agent to destroy the protozoan in paravaginal crypts and glands;

2) the failure of any previously known agent to prevent reinfection by eradicating the disease in male consorts.

The introduction of Flagyl removed both of these long-standing deficiencies. Hundreds of published investigations in thousands of patients have confirmed the ability of Flagyl to cure trichomoniasis.

Correctly used, with due attention to repeat courses of treatment for resistant, deep-seated invasion and to the presumption of reinfection from male consorts, Flagyl has repeatedly produced a cure rate of up to 100 per cent in large series of patients.

Nothing cures trichomoniasis like Flagyl.

Dosage and Administration

In *women:* one 250-mg. oral tablet t.i.d. for ten days. A vaginal insert of 500 mg. is available for local therapy when desired. When the inserts are used one vaginal insert should be placed high in the vaginal vault each day for ten days, and concurrently two oral tablets should be taken daily.

In *men:* in whom trichomonads have been demonstrated, one 250-mg. oral tablet b.i.d. for ten days.

Contraindications

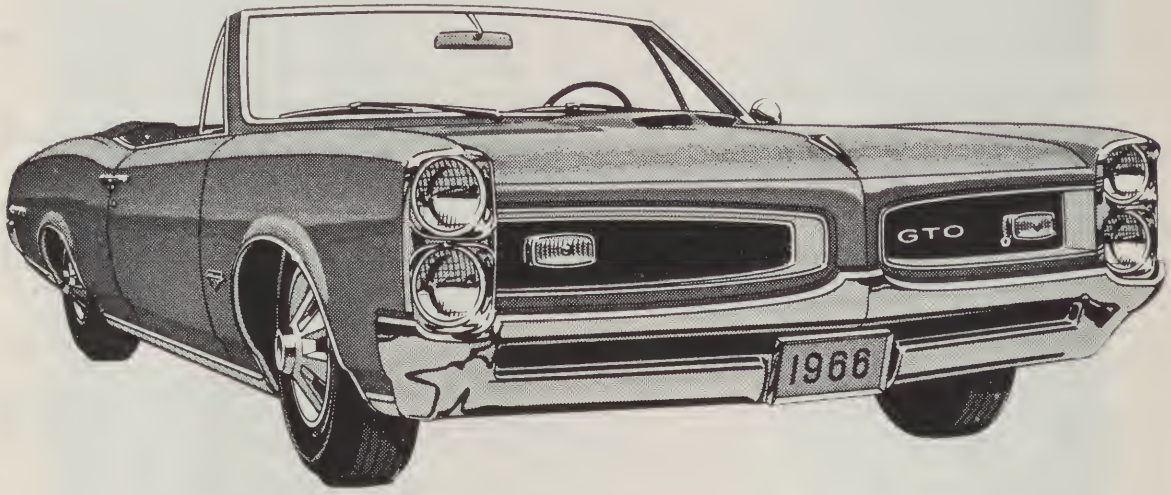
Pregnancy; disease of the central nervous system; evidence or history of blood dyscrasia.

Precautions and Side Effects

Complete blood cell counts should be made before and after therapy, especially if a second course is necessary.

Infrequent and minor side effects include: nausea, unpleasant taste, furry tongue, headache, darkened urine, diarrhea, dizziness, dryness of mouth or vagina, skin rash, dysuria, depression, insomnia, edema. Elimination of trichomonads may aggravate moniliasis.

Dosage Forms



Oral–250-mg.tablets/Vaginal–500-mg.inserts

Urological Aspects of Urinary Tract Infections

The presence of acute infections in the urinary tract should be determined and adequately treated. Prompt institution of chemotherapy or corrective surgical procedures should prevent a subsequent incurable or chronic condition.

ROBERT D. CROUCH, MD

Infections of the genitourinary tract have attracted unusual interest in recent years, especially in the field of pediatrics and the etiology of pyelonephritis. Since acute infections are curable, prevention of chronic infections is our main objective. In this day and age of chemotherapy and corrective surgical procedures, there is little excuse for allowing infections to become incurable or chronic. I happen to be one who believes it is difficult to infect a normal urinary tract; just because we cannot demonstrate abnormality does not mean it doesn't exist. Cineradiography has certainly emphasized this fact.

The most common pathogens are gram negative bacteria, mainly *Escherichia coli, Aerobacter aerogenes, Proteus vulgaris,* and *Pseudomonas aeruginoma.* These are usually single but may be in combination in chronic infections.

There is increasing evidence that ascending infection is the most common cause of urinary tract infection. This disease is common from birth to the age of 12, 80% of cases occurring in girls. New infections are seldom seen between the ages of 12 and 20; then it becomes common again, mostly involving women and paralleling the years of sexual activity. After age 60, infec-

Fig 2
Bilateral hydroureteronephrosis due to ureterovesical dysfunction

Fig 3
Postoperative correction of the ureterovesical junction shown in fig 2

tion again increases in incidence, but mostly in men because of bladder neck obstruction. All of this indicates that infections travel up the urethra.

Urethral meatal strictures, with or without hypospadia, are most common and are easily treatable. Other types also cause infection proximal to that point, especially in children. The female urethra was once considered to be just a tube and had little significance. Now we know that this "insignificant" structure can cause a great deal of morbidity and even uremia and death when obstructed. I believe in the near future urethral dilatation or calibration in newborn girls will be done as frequently in the nursery as circumcision is done on boys. I am convinced that this would eliminate many subsequent infections and obviate the need for future urologic surgery.

Urethral diverticula should be considered, especially in a woman who has repeated bouts of infections or in cases that are difficult to eradicate when the usual studies and evaluations are otherwise normal. Figure 1 illustrates such a case. This 50-year-old white woman had been treated for many weeks with various chemotherapeutic agents without benefit. Cystourethrogram and urethroscopy revealed a diverticulum. Surgical excision allowed rapid sterilization of the urine.

Contracted bladder necks are a common cause of residual urine and consequent infection in all ages. In young females, urethral stenosis or strictures are much more common, and most urologists now regard conservative treatment of periodic urethral dilatations with chemotherapy as the treatment of choice. This must depend on the patient's response and course. Vesico-ureteral reflux with progressive damage to the upper tract would require surgical intervention. Revision of the bladder neck or one of the reflux procedures of the ureterovesical junction may be necessary.

Infections of the bladder are by far the most common of the genitourinary tract. Cystitis in women is usually due to ascending infection of the short urethra. Attacks are so commonly related to sexual intercourse that some physicians are advocating prophylactic chemotherapy. Infection usually develops 36 to 48 hours after coitus. There may already be some abnormality, such as urethral stenosis or infected periurethral glands. Experimental evidence suggests that a normal bladder is difficult to infect.

Cystitis in men occurs secondary to inflamma-

tion of the kidneys or prostate or to the presence of residual urine from bladder neck obstruction. Prostatic hypertrophy with residual urine and development of calculi or bladder diverticula leads to chronic urosepsis, and complete cure becomes progressively difficult.

Chronic cystitis may be due to chronic pyelonephritis. Too often it is the result of incomplete treatment of a simple, acute cystitis.

In women, symptoms of cystitis and those of urethritis and trigonitis are often similar. A voided specimen for urinalysis or even a clean voided culture may not be enough.

Several years ago I treated a woman who supposedly had recurrent urinary tract infections. She was a military dependent and had received hundreds of dollars worth of antibiotics over a period of several years for positive cultures of "clean caught specimens." I studied this patient for over a year with numerous cultures which I collected and never once obtained a positive culture. She had urethrotrigonitis and did not require antibiotics or chemotherapy.

Isolated infections of the ureter do not occur but are secondary to other infections of the genitourinary tract. We are all familiar with the infections that follow experimental obstruction of one ureter. There are many ureteral diseases that predispose to pyelonephritis, such as vesico-ureteral reflux, ureterovesical stricture, ureteropelvic obstruction, calculi, tumor, or extrinsic obstruction.

Figure 2 demonstrates huge bilateral hydroureteronephrosis due to ureterovesical dysfunction in a 4-year-old boy after an acute urinary tract infection. The infection alone led to discovery of this condition, even though this child had been cared for since birth by skilled pediatricians.

Figure 3 shows postoperative surgical correction of the ureterovesical junction. This boy has been free of infection for nearly two years.

Abnormalities of the ureterovesical junction may be neuromuscular, congenital or acquired strictures, or damage from recurrent infections, with or without obstruction in the urethra or bladder neck. Many of these conditions result in vesico-ureteral reflux.

Congenital ureteropelvic obstructions are common. These are frequently discovered because of infections and resulting symptoms. Ideally, this correctable condition should be found before se-

vere renal damage has occurred, but figures 4 and 5 show the pre- and postoperative film of an unusual case. This 32-year-old man was found to have bilateral ureteropelvic obstruction at the time of an acute infection at age 14. Surgical division of bilateral aberrant vessels was done. Infection continued, and small bilateral calculi were found three years later. The patient did not see a physician for 10 years, at which time the preoperative film shown here was taken. He subsequently underwent bilateral nephrolithotomy at two procedures, and the postoperative film is shown with the removal of all calculi. This patient is now healthy and active with bilateral nephrostomies. Because of the marked degree of chronic pyelonephritis and hydronephrosis, nephrostomy tubes are necessary for irrigation and to prevent calculi. Simple division of aberrant vessels is not enough; frequently an underlying intrinsic stricture also requires surgical repair. This patient demonstrates that frequently treatment is possible even when the situation appears hopeless.

Recurrent renal calculi occasionally lead to pyelonephritis, but they are more often secondary to the infection.

Hematogenous infections develop in the renal cortex and usually spread to the medulla and down the ureter, the opposite of the more frequent ascending infections.

Management should be directed toward three main steps: First, establish definitely that urinary tract infection exists. Cultures may not always be necessary in lower tract infections, but the organisms should always be identified in pyelonephritis. Second, establish the presence or absence of obstructive uropathy and correction of the condition. This can usually be done with the routine urologic procedure. Again let me emphasize that failure to demonstrate minimal obstruction does not mean it doesn't exist, especially in the lower tract and specifically in the urethra, bladder neck, and ureterovesical area. Third, treat the infecting organism with appropriate chemotherapy and treat it adequately, longer than necessary if there is any doubt. There are far more patients with serious consequences from inadequate treatment than from untoward reactions to chemotherapeutic agents.

An antibiotic of choice is one that works

TAO works

Susceptibility Results
Staphylococci [2,3,1]

# OF CULTURES	YEAR	% EFFECTIVE
6,725	1962	88.6%
5,440	1963	88.0%
10,384	1964	88.5%

β-Hemolytic Streptococci [2,3,1]

2,448	1962	89.5%
1,519	1963	95.2%
2,492	1964	96.7%

The Product

In a world study of antibiotics ***in vitro***[1], TAO had an overall effectiveness of 87.3%, higher than chloramphenicol and erythromycin, and significantly higher than tetracycline and penicillin.

The Plus... Consistent Performance

Yet antibiotics must not only work. They must work consistently. Here are the results from the largest study of microbial susceptibility ever undertaken. In 29,048 cultures of overt staphylococcal and β-hemolytic streptococcal infections, note the consistency of results with TAO.

TAO®
[triacetyloleandomycin]

J. B. Roerig and Company, New York, New York 10017
Division, Chas. Pfizer & Co., Inc., Science for the World's Well-Being®

TAO Rx information

Indications: The bacterial spectrum includes: streptococci, staphylocci, pneumococci and gonococci. Recommended for acute, severe infections where adequate sensitivity testing has demonstrated susceptibility to this antibiotic and resistance to less toxic agents. **Contraindications and Precautions:** TAO (triacetyloleandomycin) is not recommended for prophylaxis or in the treatment of infectious processes which may require more than ten days continuous therapy. In view of the possible hepatotoxicity of this drug when therapy beyond ten days proves necessary, other less toxic agents, of course, should be used. If clinical judgement dictates continuation of therapy for longer periods, serial monitoring of liver profile is recommended, and the drug should be discontinued at the first evidence of any form of liver abnormality. It is contraindicated in pre-existing liver disease or dysfunction, and in individuals who have shown hypersensitivity to the drug. Although reactions of an allergic nature are infrequent and seldom severe, those of the anaphylactoid type have occurred on rare occasions. **References:** 1. Isenberg, Henry D.: Health Laboratory Science 2:163-173 (July) 1965. 2. Fowler, J. Ralph et al: Clinical Medicine 70:547 (Mar.) 1963. 3. Special Techniques of Intravenous Urography

A review of radiographic procedures for visualizing the urinary system.

The excellent visualization of the urinary system obtained after angiographic procedures and the lack of significant increase in morbidity or mortality after the intravascular injection of high volumes and high concentrations of organic iodides has led to attempts to evaluate the usefulness of high doses of contrast substance for routine intravenous urography and to the development of several techniques of nephrography which have extended the capabilities of radiologic diagnosis of urinary tract lesions.

When we speak of using high volumes of iodides on a routine basis for urography, the first question which comes to mind is, "How safe is it?" As practicing physicians and members of the medical section, you are familiar with the side effects and reactions which can occur after the intravenous injection of organic iodides. Before considering the radiologic aspects of intravenous urography, let's review some of the current thinking regarding the toxicity of contrast substances, the incidence, prevention, and treatment of which has been extensively written about. Untoward effects may be expected in approximately 10% of patients. These will vary from what may be properly termed side effects, such as nausea, vomiting, a sensation of warmth, or flushing to true allergic reactions, such as urticaria, precipitation of an asthmatic attack, or vasomotor phenomenon characterized by chills, diaphoresis, and hypotension to the point of a vasomotor collapse. The incidence of severe reactions of this type is so low that the practicing radiologist may never see one.

Probably the largest amount of data regarding the incidence of fatal reactions to intravenous urographic contrast substances has been accumulated and reported by Pendergrass and associates[13] covering the years 1942-1952 and 1953-1956. They found a relatively constant rate of fatal reactions through this entire period of time, averaging 8.6 deaths per million urographic examinations. How many of these deaths could have been prevented by prompt and proper therapeutic measures is a matter for conjecture.

From the Department of Radiology, Frederick Memorial Hospital.

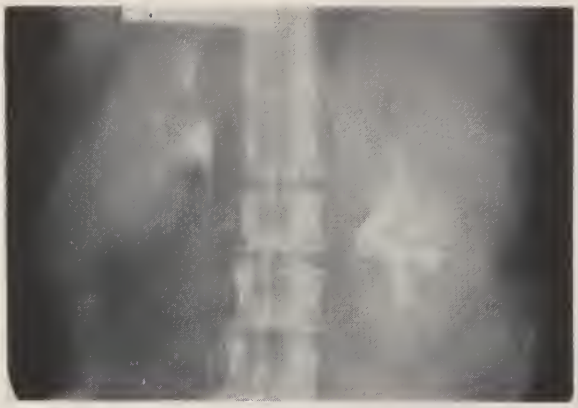

Fig 1
Left hypernephroma, Female, Age 45. Late nephrographic phase showing what appears to be a "tumor stain" in mid-portion of the mass extending from the upper pole of the left kidney.

It has been conclusively proven[7, 13] that there is no method of testing for sensitivity which is of any value. The difficulty in interpretation and unreliability of conjunctival, intradermal, or sublingual testing is well established. Similarly, with regard to the intravenous test, cases have been reported where patients did not react to a test dose of 1cc but did react to the full dose given 20-30 minutes later. On the other hand, profound and immediate reactions can occur with the injection of a fraction of a cubic centimeter. Despite the proven unreliability of the intravenous test dose, most physicians, for medical-legal reasons, will inject 1cc intravenously and wait one to five minutes before giving the rest. The minor side effects such as nausea, vomiting, or flushing do not contraindicate injection of the full volume of contrast substance, nor do they contraindicate repeated injections when necessary.

The prophylactic use of antihistamines has been proposed,[5] but its value has been questioned.[7] The preponderance of opinion at this time is that antihistamines are of no value in preventing serious reactions and should be reserved for therapeutic use in urticarial reactions. It has been suggested that one possible beneficial effect of a prophylactic antihistamine is the feeling of reassurance and confidence which it gives the physician. There is probably more truth than one would suspect in this statement, for I firmly believe that many of the minor side effects attributed to intravenous contrast substances and, for that matter, much of the discomfort associated with the barium enema examination, can be traced to the patient's anxiety which is often enhanced by the physician's attitude. It is surprising how much effect the physician can exert by the simple expedient of proper semantics. Avoiding the use of such terms as "needle" or "injection" and the classical warnings, "This will hurt a little bit," or, "You may feel nauseated," which act as suggestions which many patients are happy to accept, will greatly reduce the incidence of so-called side effects. With the patient non-apprehensive and relaxed, an examination of better diagnostic quality is often achieved.

E. F. Bernstein et al[3] have published data concerning the toxicity of sodium diatrizoate (Hypaque) 90% in dogs following rapid intravenous injection within five seconds. They found that in doses titrated between 1 to 6cc/kg body weight, the LD 50 was 3cc/kg and the LD 100, 5cc/kg. In those animals which died, death generally occurred within one minute of injection and was characterized by acute hypotension and electrocardiographic abnormalities which showed an initial rapid tachycardia followed by severe bradycardia with ischemic ST-T wave changes. The LD 50 dose of 3cc/kg is equivalent to 2700mg/kg of Hypaque-90. Studies by Hoppe[9, 10] established a LD 50 dose of 13,200mg/kg of Hypaque, but this was administered by intravenous drip at a rate of 12cc/minute. Bernstein concluded that the marked decrease in the LD 50 dose in his experiment was directly related to the rapid injection.

Read[15] has shown that there is erythrocyte agglutination after intravenous administration of hypertonic solutions, including sodium diatrizoate. This theory of erythrocyte sludging as a basis for the fatal reactions to intravenous contrast substance has been generally accepted, and the use of dextran in the prevention of same has been reported and accepted clinically.

In a second publication,[2] Bernstein and coworkers report that the LD 50 and LD 100 dose is approximately doubled in dogs by premedication with dextran. They also report a series of 21 patients who were given an average dose of 1.39cc/kg of 90% sodium diatrizoate for venous aortography after premedication with 15% dextran in 5% dextrose, given in a dosage of 10cc/kg. No mortality or serious complication occurred. Although dextran was proved to be the best premedication in the dog experiments, Bern-

stein also showed that the LD 50 dose of Hypaque-90 was increased by hydration of the animals with 5% dextrose or normal saline. In a routine angiocardiographic study, a patient may receive as much as 3cc/kg of 70% sodium diatrizoate. O'Connor aand Neuhauser[12] have used 3-4cc/kg of 50% sodium diatrizoate in infants to achieve what they term "total body opacification."

Since high volumes and concentrations of the modern tri-iodinated contrast substances can be given with as much safety as the 20-30cc dose used in conventional intravenous urography, is there any advantage to be gained by the use of high volumes of contrast substance routinely? Friedenberg and Carlin[8] compared the diagnostic quality of intravenous urograms using the standard 30cc dose of 50% sodium diatrizoate with a second examination on the same patient employing a dose based on the body surface area and ranging from about 30cc in an 87-pound, 1.30 square meter area patient to 80cc in a 202-pound, 2.12 square meter patient. They classified each examination as *excellent, good, fair,* or *poor* and found that the frequency of excellent or good examinations was increased from about 65% with the standard dose to about 95% with the high volume technique. They cite the following advantages of the high volume method: 1) urograms of diagnostic quality in larger patients are more easily obtainable; 2) the more intense nephrographic effect allows the diagnosis of parenchymal lesions often not visualized otherwise; 3) the ureters are more completely filled, which is important in determining displacement due to extrinsic abnormalities; 4) the bladder is better opacified, especially after one hour, and voiding urethrograms can be obtained. They also point out that the technique is of value in producing diagnostic urograms in the presence of renal insufficiency.

Thirty-eight of the 570 patients in the series had elevated blood urea nitrogen levels ranging from 22 to 92mg/100cc, with 17 having levels above 30mg/100cc. The quality of the urograms obtained in these patients was excellent in 11, good in 9, fair in 10, and poor in 8. Thus, excellent or good studies were obtained in more than half of the patients with renal insufficiency. More side effects occurred in the patients receiving high volumes of contrast substance, but these were minimal. The incidence of nausea increased from 7 to 13%; vomiting from 5 to 6% urticaria occurred in 1.5 and 1.4% of the standard and high volume studies respectively.

One of the advantages of the high volume technique is the nephrographic effect produced in a higher percentage of patients. The nephrogram refers to the opacification of the renal parenchyma as the contrast substance passes through the arterial system and is filtered through the glomeruli. If the renal parenchyma is sufficiently opacified, absence of normal parenchymal tissue or areas of decreased vascular supply can be demonstrated, especially if tomography is performed during this phase. Thus, the nephrogram or nephrotomogram can be an important diagnostic tool in differentiating between a benign renal cyst or a carcinoma. A renal cyst will be demonstrated as a radiolucency and, if it is large enough, will usually cause extrinsic pressure on portions of the collecting system. A tumor mass will show a normal opacification indistinguishable from the rest of the renal parenchyma or possibly an increased opacification; delayed films may show residual staining in the area due to retention of contrast substance in the vascular bed of the tumor (fig 1).

One possible source of error in differentiating between a renal cyst and a neoplasm occurs when there is a well circumscribed tumor which has undergone central necrosis, since both lesions will be demonstrated as an area of radiolucency on the nephrogram. Bosniak and Faegenburg[4] have recently described a diagnostic sign which will help to avoid some of the pitfalls in diagnosing necrotic renal tumors. They have observed that the walls of a true benign renal cyst are seldom visualized and, when they are, they appear as a thin line of about the thickness of a sharp pencil line. A necrotic renal carcinoma, on the other hand, will show the radiolucent center of a renal cyst, but the walls will be demonstrable and often will be irregular in thickness.

Evans,[6] in 1957, was one of the first to devise a technique of nephrotomography and to demonstrate its value in the differential diagnosis of space-occupying lesions of the renal parenchyma. With his method, the patient is first given a 30cc dose of 50% sodium diatrizoate intravenously, which acts as a "loading" dose to the renal parenchyma and enables identification of the collecting systems. The arm-to-tongue circulation time or the arm-to-kidney circulation time is then determined by means of intravenous dehydrocholic

acid (Decholin) or radioactive tracer material. Five minutes after the loading dose, 50cc of 90% sodium diatrizoate is injected rapidly through a large bore needle, and films are exposed at the determined circulation time and at rapid intervals thereafter. The initial film is intended to outline the arterial system of the kidneys and, in practiced hands, often shows an excellent arterial phase. However, the timing is critical, and the diagnostic quality is not as good as that obtained by renal arteriography.

The nephrographic phase of the intravenous urogram is also useful in diagnosing renal vascular disease associated with hypertension. While it is possible to obtain sufficient parenchymal visualization by early sequence films at 15 seconds, one, and two minutes after injection of the standard 30cc dose of contrast substance, the increased nephrographic effect associated with high volume doses enables better differentiation of minor differences in renal opacification.

Proper tomographic examination of the kidneys often requires views at various levels in order to demonstrate multiple lesions or to define the limits of a large lesion. At times both the kidneys cannot be well demonstrated at a single level, because of normal variation or displacement of one kidney by an extrinsic mass. For this reason, one may prefer a method elaborated by Schencker,[16] which he termed "drip infusion pyelography." All of the advantages noted by Friedenberg and Carlin in their high volume technique are present with the drip infusion method; at the same time, a lasting nephrographic phase is produced which permits an unhurried examination of the renal parenchyma by conventional or tomographic methods. No arterial phase is demonstrable, but otherwise nephrograms of comparable quality to those obtained by the Evans method can be achieved.

The principle of the drip infusion technique is to achieve complete filling of the urinary tract in the hydrated patient through the diuretic effect of the rapid infusion of a mixture of Hypaque-50 and 5% dextrose in water. Schencker recommends using 1cc per pound of body weight of 50% sodium diatrizoate mixed with 1cc per pound of 5% dextrose in water. The minimal adult dose is 150cc of each. The mixture is given by means of intravenous infusion and is allowed to drip rapidly through an 18 gauge needle over a period of six to 10 minutes. Optimal parenchymal opacification occurs at the end of the infusion, and there is progressive filling of the entire collecting system thereafter, usually reaching a maximum 20-30 minutes after the start of the infusion.

Complete visualization of the collecting systems, the entire length of both ureters, and the bladder is almost routinely possible. Pyelograms of diagnostic quality may be obtained in patients who have elevated blood urea nitrogen levels and in whom the routine intravenous pyelogram would show little or no excretion of contrast substance (fig 2).

Early sequence films for the diagnosis of differential parenchymal opacification between normal and ischemic kidneys (fig 3) can be accomplished with the infusion technique, the recommended exposure times being two, three, four, and five minutes from the beginning of the infusion. A 20 or 30 minute film is then taken for demonstration of the complete urinary tract. Thereafter, the "washout phase" is recorded by films every five minutes for 20 minutes after the infusion of 600cc of normal saline containing 40gm of urea. The normal kidney will show a washout of contrast substance, where the ischemic kidney will show a retention and hyper-concentration of the contrast substance. The importance of performing the washout test has been emphasized by a number of authors,[1, 11, 18] who have reported a high correlation between the washout studies and split renal function tests, aortograms, and the findings at surgery. Schreiber and coworkers[17] maintain that a normal washout pyelogram excludes unilateral renal artery insufficiency, and an abnormal study is a definite indication for further confirmatory tests.

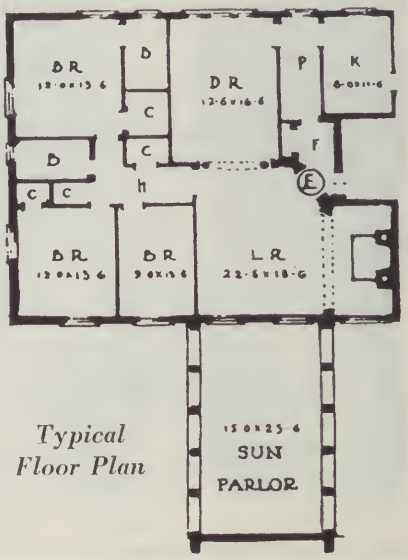
The chief disadvantage to the infusion method of pyelography is the cost. With a minimum adult dose of 150cc of sodium diatrizoate, the cost of the contrast substance alone is $8.50, and for a patient weighing more than 200 pounds, the cost of the contrast substance plus the intravenous infusion apparatus can amount to nearly $15. This price possibly could be decreased if the pharmaceutical houses would package the material in larger volume vials. If the cost per examination can be reduced, the infusion method offers obvious advantages over the standard method for use in routine pyelography. The complete filling of the urinary tract at a predictable time permits fewer exposures, decreasing the amount

Fig 2
Infusion urogram; 24-hour delay film showing large calculus obsrructing the right upper ureter. 83 year old male; BUN 65.

Fig 3
Left renal infarct; 59 year old male. Infusion urogram; tomogram taken eight minutes after start of infusion. Note differential parenchymal opacification left upper pole.

of radiation to the patient. The excellent demonstration of structural detail obtained almost routinely obviates the need for repeat examinations, and retrograde studies may be avoided in many cases.

Assuming that the economic barrier cannot be overcome, what are the indications for using this method? 1) The infusion pyelogram is indicated without a preliminary standard pyelogram when the BUN is elevated, in which case it may be assumed that the standard method will show little or no concentration and result in an unsatisfactory examination. 2) The prolonged nephrographic phase is advantageous for tomographic studies in the diagnosis of space-occupying lesions of the renal parenchyma; therefore, the infusion technique is indicated whenever a renal tumor is suspected clinically or on the basis of a plain film of the abdomen. 3) It is indicated when it is necessary to completely outline both ureters in their entire length in order to demonstrate displacement due to extrinsic pressure. 4) It should be used when the collecting systems are not well defined by the standard urogram and a retrograde examination would ordinarily be done only to demonstrate same. 5) It should be done in all hypertensive cases referred for renal evaluation. The techniques noted above provide the most satisfactory visualization of the nephrographic phase of excretion, and the washout test can be easily performed through the intravenous infusion already in place.



What are the contraindications for the infusion pyelogram? Obviously, a sensitivity to iodinated contrast substances, determined by history or by the intravenous test dose, prohibits their use in urography or any other iodine contrast study. A precarious cardiovascular status, while not an absolute contraindication, necessitates caution in giving a rapid intravenous infusion. On the other hand, the injection of contrast substance is better tolerated in the hydrated state by the patient with renal insufficiency. Finally, patients known to have plasma cell myeloma probably should not be given intravenous contrast substance because of the risk of precipitating anuria, as has been reported in several isolated cases. However, since the proteinaceous casts which have been found plugging the convoluted and collecting tubules at autopsy are thought by some authors to be the result of dehydration and increased urine concentration, causing precipitation of Bence-Jones protein rath-

The Garden Apartments

IDEAL LOCATION

- Situated in one of the most beautiful and secluded spots in the Roland Park-Guilford-University Parkway section. Five units facing a terrace of well-kept lawns and shrubbery across a 180-foot court.
- Convenient to all Roland Park schools, churches and community activities. Less than two blocks from public transit.
- Easy to reach! From N. Charles St. drive west on 39th Street to Stony Run Lane, then one block right.

Typical Floor Plan

Three bedrooms, three baths; all apartments have three exposures. Living room with fireplace, full dining room, hardwood floors, porch or sun parlor. Fireproof construction of hollow tile and reinforced concrete, stucco covered walls. Luxurious comfort summer or winter.

Announcing
EUTRON™
pargyline hydrochloride 25 mg. and methyclothiazide 5 mg.

for control of moderate to severe hypertension

Unique combination produces greater antihypertensive effect with lower doses

Eutron is the combination in a single tablet of 25 mg. Eutonyl (pargyline hydrochloride) and 5 mg. Enduron (methyclothiazide). This combination produces greater therapeutic effect than that of either component used alone. Side effects may be milder, too, as dosages are generally lower. The effective dosage is usually one tablet, once daily. Tablets are scored for greater dosage flexibility.

Each Eutron tablet contains two proven antihypertensives in the ratio shown to be most effective in most patients.

TM—TRADEMARK

New **EUTRON** extends your range of treatment in moderate to severe hypertension

A single product you can use even in the presence of congestive heart failure or edema

Eight out of 10 patients respond

In clinical trials, Eutron produced normotension or a significant reduction in blood pressure in eight out of 10 patients studied. The rationale for the product is this: Eutonyl used alone is a potent antihypertensive. Its antihypertensive action is markedly enhanced by Enduron, a potassium-sparing thiazide.[1,2,3] The combination (Eutron) thus produces greater antihypertensive effect with lower dosages of the Eutonyl component, and milder side effects may be seen.

3. Bryant, J. M. et al., Antihypertensive Properties of Pargyline Hydrochloride, New Non-Hydrazine Monoamine Oxidase Inhibitor Compared with Sulphonamide Diuretics, J.A.M.A., 178; 406, Oct., 1961.

BP reductions in the recumbent and sitting positions often are nearly as great as in the standing. In clinical trials, the average *recumbent* BP reduction was 36/18 mm. Hg.

The average *standing* reduction in clinical trials was 45/22 mm. Hg. Thus the difference between the standing and recumbent readings was only 9/4 mm. Hg.

Significantly lowers blood pressure in all body positions; less likelihood of orthostatic hypotension

In clinical trials, the average reduction in standing blood pressure was 45/22 mm. Hg.; in the sitting position it was 48/20 mm. Hg.; and in the recumbent position, 36/18 mm. Hg.

Because Eutron effectively reduces blood pressure in all body positions, there is reduced likelihood of orthostatic symptoms or hypotension.

This was reflected in the relatively mild character of side effects seen in clinical trials (see below).

Smooth and gradual onset

Onset of antihypertensive action is usually quite smooth. Initial reduction of systolic and diastolic readings is usually seen within a week — maximum reduction in seven to ten days.

Less troublesome side effects may be seen; frequent improvement in "sense of well-being"

Fewer than 1% of patients studied discontinued Eutron therapy because of side effects. This is due in part to the relatively low dosage needed with the combination. Usual recommended dose is one tablet daily—that is, 25 mg. Eutonyl with 5 mg. Enduron. *This is about half the usual therapeutic dose of Eutonyl given alone.* As a consequence side effects may be milder. And, as with Eutonyl given alone, the patient may well note an increased sense of well being. This is in distinct contrast to most other antihypertensive therapy.

ABBOTT

Prescribing information for **EUTRON**

INDICATIONS: Eutron (pargyline hydrochloride and methyclothiazide) is indicated in the treatment of patients with moderate to severe hypertension, especially those with severe diastolic hypertension. It is not recommended for use in patients with mild or labile hypertension amenable to therapy with sedatives and/or thiazide diuretics alone.

CONTRAINDICATIONS: Eutron is contraindicated in patients with pheochromocytoma, advanced renal disease, paranoid schizophrenia and hyperthyroidism. Until further experience is gained it cannot be recommended for use in patients with malignant hypertension, children (under 12 years of age), or pregnant patients.

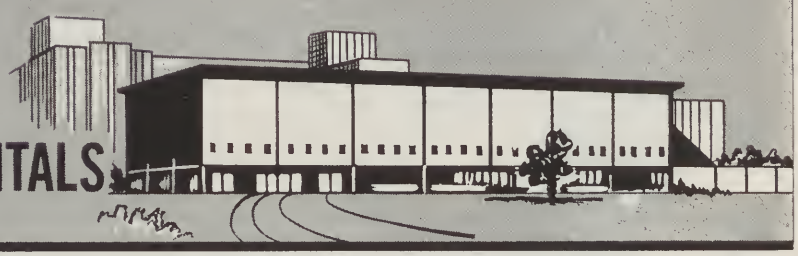
The concomitant use of the following is contraindicated: other monoamine oxidase inhibitors; parenteral forms of reserpine or guanethidine; sympathomimetic drugs; foods high in tyramine such as cheese; imipramine and amitriptyline, or similar antidepressants; methyldopa. A drug-free interval of two weeks should separate therapy and use of these agents.

WARNINGS: Pargyline hydrochloride is a monoamine oxidase inhibitor. Patients should be warned against eating cheese, and using alcohol, proprietary drugs or other medication without the knowledge of the physician. When it is necessary to administer alcohol, narcotics (notably meperidine), antihistamines, anesthetics, barbiturates and other hypnotics, sedatives, tranquilizers, or caffeine, these agents can be used cautiously at a dosage of ¼ to ⅕ the usual amount. Avoid parenteral administration where possible. Withdraw pargyline two weeks before elective surgery.

Patients should be warned about the possibility of postural orthostatic hypotension. Those with angina or other evidence of coronary disease should not increase physical activity. Pargyline may lower blood sugar. Potassium depletion is unlikely at the recommended dosage, but if it occurs, adjust dosage or withdraw or provide added natural food sources of potassium; potassium tablets should be avoided wherever possible, as bleeding or obstructive ulceration of the small bowel has been associated with their use; potassium levels should be especially watched if the patient is on digitalis or steroids, or if hepatic coma is impending.

PRECAUTIONS: When determining the antihypertensive effect of Eutron, blood pressure should be measured while the patient is *standing*. Use with caution in hyperactive or hyperexcitable persons. Such persons may show increased restlessness and agitation. Withdraw drug during acute febrile illness. Watch patients with impaired renal function for increasing drug effects or elevation of BUN and other evidence of progressive renal failure; withdraw drug if such alterations persist and progress. Pargyline has not been shown to cause damage to body organs or systems. As with all new drugs, complete blood counts, urinalyses, and liver function tests should be performed periodically. The drug should be used with caution in patients with liver dysfunction. With prolonged therapy, examine patients for change in color perception, visual fields, and fundi.

Elevated blood urea nitrogen, serum uric acid or blood sugar are possibilities attributable to the methyclothiazide in Eutron. Methyclothiazide may also reduce arterial response to pressor amines. Blood dyscrasias, including thrombocytopemia with purpura, agranulocytosis and aplastic anemia, have been seen with thiazide drugs.



SIDE EFFECTS: The use of pargyline may be associated with orthostatic hypotension. Mild constipation, slight edema, dry mouth, sweating, increased appetite, arthralgia, nausea and vomiting, headache, insomnia, difficulty in micturition, nightmares, impotence, delayed ejaculation, rash, and purpura have been encountered with pargyline. Hyperexcitability, increased neuromuscular activity (muscle twitching) and other extra-pyramidal symptoms have been reported. Drug fever is extremely rare. Congestive heart failure has been reported in a few patients with reduced cardiac reserve. Nocturia has been observed with the combination. If side effects persist, despite symptomatic therapy or reduction of the dose, discontinue the drug.

History of the Baltimore City Hospitals

BY DOUGLAS CARROLL, M.D.

Surprisingly little attention has been paid to the changing patterns of medical care in the United States. A study of the evolution of a public institution may be helpful in understanding the broad political and philosophical presuppositions of the times. In studying the transformation of the Baltimore Almshouse into the Baltimore City Hospitals, one might expect to discover in its attitudes and practices toward its patients a particularly sensitive key to the culture of the community. The way a municipality treats its most unfortunate citizens is a measure of its moral temperament.

This study has revealed several clear tendencies in the evolution of the Baltimore City Hospitals. First, large improvements in patient care have evolved only after major, sometimes revolutionary, changes in philosophical, moral, religious, social, or scientific attitudes and thought. These changes, however, have been gradual and not clearly recognized at the time. Second, all of these creative new ideas have been imported from Europe, most frequently from England, France, and Germany. Third, social progress has lagged far behind scientific advance and continues to do so today. Fourth, the Almshouse has shown an uninterrupted trend from a general institution for the solution of all community social problems to an institution for medical care. Fifth, financial responsibility for the Almshouse has fitfully passed from the City of Baltimore to be shared by the state and finally by the federal government.

Chapter 1.—The First Almshouse: Abating a Public Nuisance (1773-1822)

An Almshouse is, in its nature, merely an asylum for poverty. Here the poor, without respect to age or sex, have a right to find food and shelter. If it provides medicine and professional attendance, it is because these are inevitably incidental to such an establishment, and not because they are the objects of it.[1,2]

THE FOUNDING OF THE BALTIMORE COUNTY ALMSHOUSE

From the earliest times in America, the sick poor were cared for under a system inherited from England (the Elizabethan Poor Law of 1601). This English law traced its origin to the sixth century medieval Italian parishes, where tithes were collected locally by the parish church and were used to take care of the infirm and orphans.[3] Tithes were the first universal income tax. Local administration of welfare services, although never adequate, continued in the United States up to the great depression of the 1930's. It took the major social revolution of the 1930's to bring about recognition that the federal government had obligations for the welfare of its citizens.

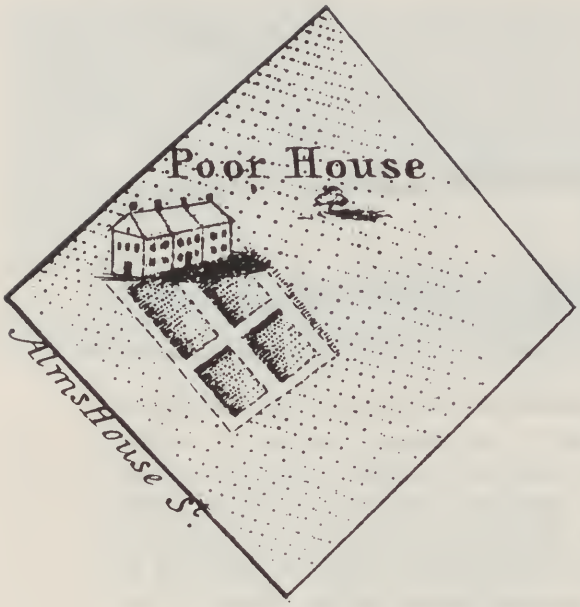

Fig 1

We have been unable to locate a good picture of the first Almshouse (1774-1822). The sketch was reproduced from Warner and Hanna's 1801 Map of Baltimore (revised from survey of 1797). This building was erected at Biddle and Eutaw Streets in 1774. The dome and east wing were destroyed by fire in 1776. The main building was rebuilt immediately, but the east wing not until later. This building served all the needs of the indigent of Baltimore. It was an acute, chronic, and lying-in hospital, a workhouse, and a shelter for vagrants, criminals awaiting trial, the insane, foundlings, and the old and infirm.

When the population in the colonies reached a certain level, it became cheaper to care for the poor by building an almshouse. Prior to the beginning of the almshouses, taxes were set aside by the various counties to pay individuals for taking care of the infirm and orphans. The Boston Almshouse was built in 1680. In New York, the ancestor of Bellevue Hospital was started in 1736. In Charleston, SC, the forerunner of Memorial Hospital was founded in 1738; in Philadelphia,[4] the beginnings of the Philadelphia General Hospital were laid in the Almshouse of 1742. The Baltimore County Almshouse was founded in 1773. These institutions were not founded as hospitals but as depositories for the poor.

Before the Revolution, Baltimore, the youngest of the large eastern seaports, was of little consequence. The activities of the war, the growing population, and the meeting of the Continental Congress in Baltimore in 1777 contributed to its growth. By the end of the Revolution, its population was estimated at 8,000.

In 1773, the Maryland legislature voted 4,000 pounds in bills of credit for the purchase of land and the erection of an almshouse and work house. The first Almshouse was located on a 20-acre plot, site of the present Richmond Market. Within a year of its building, a fire broke out in the garret destroying most of the building. It was immediately rebuilt.[5]

The institution was divided into two sections. Beggars, vagabonds, and vagrants were sent to the Workhouse and were required to work. The other section, the Almshouse, was for the poor and infirm. From the beginning, a doctor was associated with the Almshouse to care for the large number of sick, who were housed in an infirmary in the Almshouse.

GROWTH OF WELFARE SERVICES IN AMERICA

The dumping of all the social problems of the community into a single institution was designed more to save money and administrative headaches than to help the sufferer. In 1779, however, the legislature authorized the Trustees of the Poor to pay a pension of $30 maximum to 10 persons in circumstances particularly unsuitable for the Poorhouse.[5] Those who remained in foster homes must have been the favored few, for some citizens objected to the provision of any relief at all to the poor.

Welfare services in the United States have always rested on a largely accepted body of opinion that no one should be allowed to starve or suffer for shelter or clothing. This middle ground has, for centuries, been unsuccessfully attacked by advocates of limited government, laissez-faire, social Darwinism, and puritan moralists. For example, in 1786, the Rev. Joseph Townsend, an English clergyman, in his "Dissertation on the Poor Laws," objected to the provisions of the Poor Law. He said that only hunger could goad a man to work, and it would be unfortunate if the poor were helped because there would be no one left to do the most difficult, sordid, and ignoble jobs. He

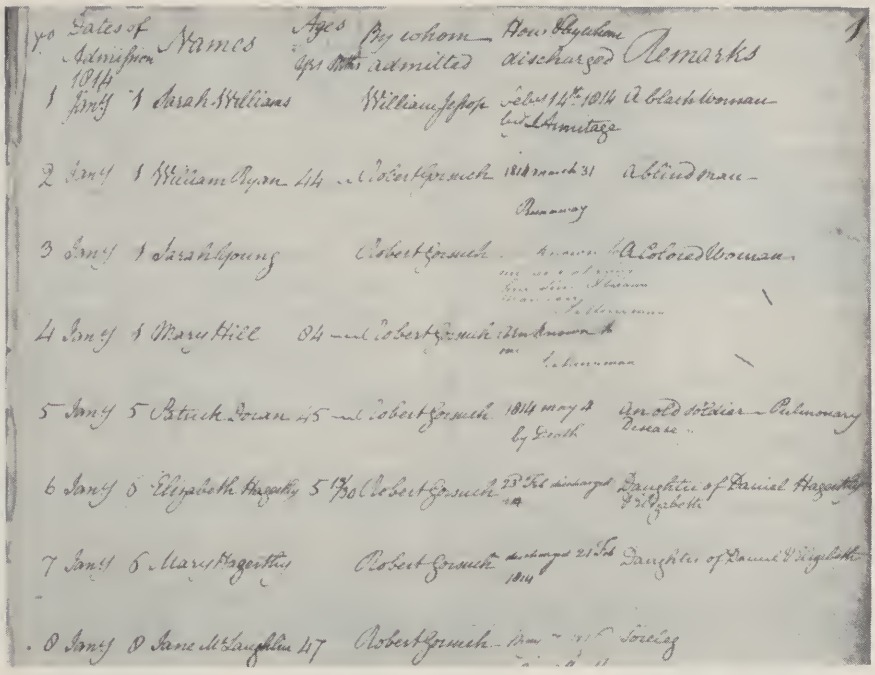

Fig 2

Almshouse admission and discharge book (1814-1826). This large book was started February 20, 1814, and all inmates of the Almshouse were listed. The patient's number, name, age, person who admitted patient, disposition with date, and miscellaneous remarks were entered in columns for each patient. Two hundred and sixty-four inmates were in the Almshouse on February 20, 1814. One patient had been admitted in 1778, but most were much later and stayed for only a few months.

There were 8,317 admissions between February 20, 1814, and May 25, 1826, when the book ends. Reasons given for admission are as follows: "By birth," "Blind," "Poverty," "Deranged," "Idiotism," "A drunken fellow," "A vagrant," "Consumption," "Pregnant." A small number of inmates were criminals admitted to serve up to seven years. Others were admitted as emergencies, as foundlings. No patient was admitted as a transfer from another organization; nor is there any record of an inmate's being discharged to a hospital or other institution.

thought that compulsory provision of relief under the Poor Laws kept wages from falling and, therefore, should be abolished.

From the opposite side, welfare services have been attacked as being too limited. Improved living conditions, education, training, unemployment insurance, and health services have been urged in the Judeo-Christian tradition by those who see the government as responsible for its citizens and particularly effectively by labor unions and the elderly.

A number of charitable organizations were founded in England in the late eighteenth century. In 1796, Sir Thomas Bernard founded the Society for Bettering the Condition and Increasing the Comforts of the Poor. Health insurance had its beginning in the Roman Catholic Sick Club of Norwich in 1782.

EIGHTEENTH CENTURY PHYSICIANS AND HOSPITALS IN AMERICA

There were three types of physicians in America at the time of the Revolutionary War. A few had been highly trained in Europe at the feet of the

great clinical masters. Others had learned as apprentices to physicians in practice. Their training often consisted of being their preceptor's pharmacist. In addition to learning about herbs and drugs, many read the standard European textbooks of the time: Sydenham, Van Swieten, and Boerhaave. Only a few had attended one of the medical schools in America. Medical schools offered lecture courses taken after an apprenticeship. The third group had little or no training but had the audacity to set out their shingle and call themselves physicians. Many were pure quacks, but it was even more difficult in those days to distinguish between a quack and a well trained physician than it is today. Diagnosis of internal illnesses was almost unknown. Only the obvious traumatic injuries were accurately recognized.

The oldest hospital in the colonies, the Pennsylvania Hospital, chartered in 1751, was financed by public subscription and a grant of 2,000 pounds from the Pennsylvania Assembly. Such hospitals catered to patients with acute illnesses, had a board of trustees drawn from the leaders of the community, and took mainly surgical cases.

Most physicians spent their time in home visits, for the well-to-do patient would not think of coming to the hospital except for surgery or injury. Deliveries were performed in the home, often by midwives, but by a physician if the patient was wealthy and lived in a large city.

The danger of infectious diseases in general hospitals was well known. A second type of hospital was the pest house, usually operated only during epidemics. Smallpox, yellow fever, malaria, typhoid, typhus, cholera, and dysentery constituted a large part of medical practice. When these diseases occurred in a hospital or other institution, many inmates died. Special hospitals to isolate these people from the community were, therefore, demanded during epidemics. When the threat was over the hospital closed.

A third type of hospital was that attached to every almshouse to care for the infirm and sick inmates. Out of these institutions developed some of the largest municipal hospitals of today: the Philadelphia General Hospital, Bellevue in New York, Memorial Hospital in Charleston, and the Baltimore City Hospitals.

MARYLAND POISON INFORMATION CENTER

A central Poison Information Center is now in operation to serve the entire state of Maryland. THIS SERVICE IS PRIMARILY FOR PHYSICIANS and is available 24 hours a day, seven days a week. The Center will also give authorized first aid instruction to laymen who call until they can reach their physician or an emergency ward. Inquiries from physicians will be handled by paramedical personnel experienced in locating technical information. Medical consultation is also available. The existing eight poison control centers in Maryland will continue to function primarily as treatment centers.

Telephone DI 2-0800. If no answer, call DI 2-5400, ext. 428.

Revised Regulations Relating to Communicable Diseases

First Amendment

Paragraph -03 *RULES AND REGULATIONS* (page 43) is amended as follows:

0302 **Reportable Diseases**

Amebiasis	Hepatitis:	Psittacosis
Animal bites	" infectious	Rabies
Anthrax	" serum	Rocky Mountain spotted fever
Botulism	Industrial or occupational diseases	Rheumatic fever
Brucellosis	Leprosy	Rubella
Chancroid	Leptospirosis	Salmonellosis including typhoid and paratyphoid
Chickenpox in adults	Lymphogranuloma venereum	Shigellosis
Cholera	Malaria	Smallpox
Diarrhea of newborn	Measles	Staphylococcus infection, newborn
Diphtheria	Meningococcal infection meningitis	Streptococcal infection, including scarlet fever
Encephalitis	meningococcemia	Syphilis
" primary	Meningitis, other	Tetanus
" post infection	Mumps	Trichinosis
Food poisoning	Plague	Tuberculosis
Gonococcal infection:	Poisoning or adverse reactions from drugs or other toxic agents	Tularemia
" urethritis		Typhus fever
" vulvovaginitis	Poliomyelitis	Whooping cough
Ophthalmia neonatourm		Yellow fever
Granuloma inguinale		

030201—The above list of reportable diseases was adopted by the Board, December 30, 1965, and may be changed at any time by action of the State Board of Health and Mental Hygiene.

030202—All cases of the following are to be reported to the local health department immediately by telephone:

Animal bites	Cholera	Rabies—in animal and man
Anthrax	Food poisoning	Smallpox
Botulism	Leprosy	Typhus
Chickenpox in adults	Plague	

On receipt of notification of any of the above diseases or occurrences, special instructions for control will be issued by the local health officer.

030203—An outbreak of any disease or condition, of known or unknown etiology, which may be a danger to public health, occurring in three or more persons, or any unusual manifestation of a disease in an individual are to be reported to the local health officer who shall in turn notify promptly the Commissioner of the State Department of Health.

030204—The following diseases are to be reported weekly by total number of cases and not by individual case reports in accordance with instructions issued by and on forms provided by the State Health Department:

Measles	Streptococcal infections, including scarlet fever
Mumps	
Rubella	

030205—All other reportable diseases not mentioned in 030202 and 030204 are to be reported promptly to the local health department or the State Department of Health by individual case reports, in accordance with instructions issued by and on forms provided by the State Health Department.

Amended December 30, 1965, State Board of Health and Mental Hygiene.

WASHINGTON COUNTY

A large proportion of the society attended the November dinner-business meeting, at which **Mr. Dixon Evander** discussed the new Faculty-sponsored accident and health policy and major medical insurance. A movie on medicare was shown.

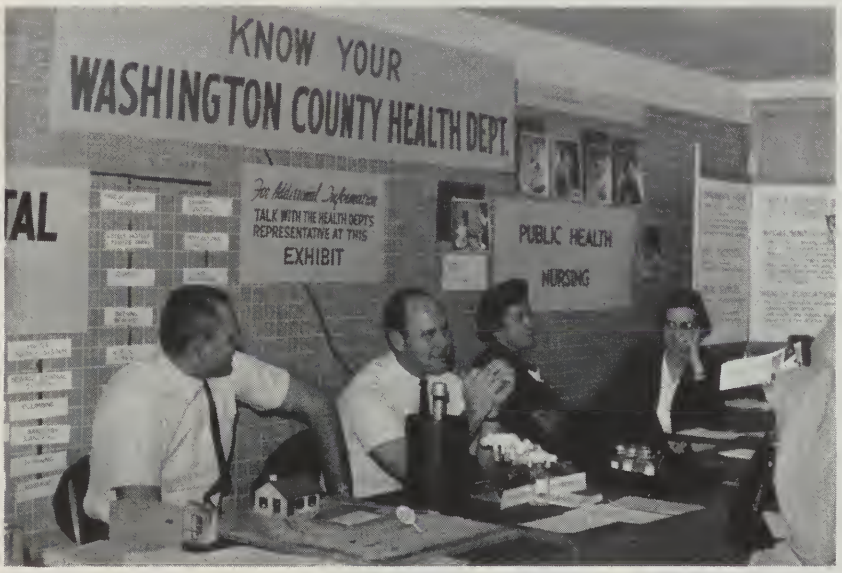
The County Medical Society endorsed a resolution proposed by **H. H. Gist, MD,** favoring the formation of supervised junior high school football, as opposed to the current status of unsupervised football games played by junior high school children.

New officers of the society are **Richard A. Young, MD,** president; **Richard T. Binford, MD,** vice president; **John W. Clark, MD,** secretary; and **Sidney Novenstein, MD,** treasurer. The outgoing president, **Joseph C. Crisp, MD,** summarized the accomplishments of the County Medical Society during the past year.

* * * * *

A health fair was held at the North Hagerstown High School on November 13 and 14. This was jointly sponsored by the Washington County Medical Society and the Community Services Council of Washington County. The chairman of the fair was **Richard A. Young, MD.** Fourteen groups participated as exhibitors. Approximately 10,000 people visited the fair during the two days. This is the first fair of its kind ever held in Washington County and, as far as we know, the first health fair in the state. A repeat is planned for next year. The medical society demonstrated a plastic lady, supplied by the AMA, and the Woman's Auxiliary performed urine and blood tests for diabetes, using Ames diagnostic apparatus.

John W. Clark, MD, DDS



The meaningful pause. The energy it gives. The bright little lift. Coca-Cola with its never too sweet taste, refreshes best. Helps people meet the stress of the busy hours. This is why we say **things go better with Coke** TRADE-MARK®

Washington County's Health Fair

The Washington County Medical Society featured a plastic lady at its first health fair. *Left to right:* Archie R. Cohen, MD, Richard A. Young, MD, and Mrs. Jack H. Beachley.

Representing the Washington County Health Department, *left to right:* Nelson Tillou and John Waldrin, sanitarians; Mrs. Rosalie Paul and Mrs. Leona Hettenhouser, public health nurses.

WICOMICO COUNTY

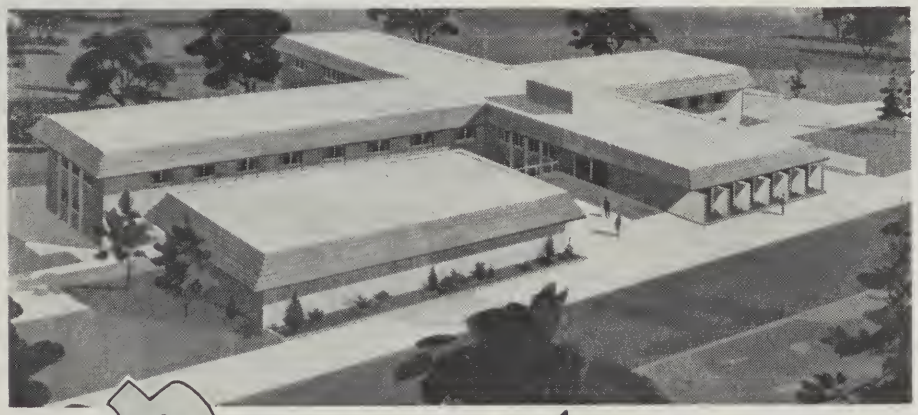
In observance of Community Health Week, the Wicomico County Medical Society publicized immunization, using 60 radio spot announcements over two local stations, and several news stories in the local newspapers. An editorial in *The Daily Times* also stressed the importance of this health protection and commended the society for its campaign in the public interest.

* * * * *

Talmadge Reeves, MD, appeared as a panelist for District Four, Maryland Nurses Association, during its day-long mental health seminar in mid-November in Cambridge. Dr. Reeves discussed care of mental patients in general hospitals and their relationship to mental hospitals.

* * * * *

William P. Sadler, MD, contributed to an advanced first-aid training program for members of several fire departments and their auxiliaries by providing a program on closed chest cardiac massage on December 1.



* * * * *

William S. Womack, MD, and **Richard E. Hughes, MD,** answered questions on uterine cancer control after showing a special movie at a Salisbury theater on November 29. This was in cooperation with the Salisbury chapter of the Maryland Cancer Society. **James P. Gallaher, MD,** appeared on a television panel on November 26 as part of the same project.

* * * * *

John Sargeant, executive secretary of the Medical and Chirurgical Faculty, was guest speaker at the November meeting of the Wicomico County Medical Society. He discussed a number of activities of the Faculty and answered members' questions. The December program was provided by several members of Jehovah's Witnesses, who discussed ways in which their religious beliefs might affect medical care.

WORCESTER COUNTY

Ivory U. Sully, Jr., MD, was elected president of the Worcester County Medical Society at its October meeting. Dr. Sully practices general medicine in Berlin.

Born in Richmond, Va., he attended public schools there and graduated from Virginia Union University in 1936 with a Bachelor of Science Degree. He then went into the insurance business until his induction into the Army in 1943. He served in the army until December, 1945, attaining the rank of first sergeant. He was in the European Theatre of Operations.

In 1948 Dr. Sully completed residence requirements for the Master of Science Degree at the State University of Iowa. He studied medicine at Howard University Medical School and was granted his Doctor of Medicine degree in 1952. After completing his internship at DC General Hospital, Dr. Sully entered practice in Berlin.

Dr. Sully

Other officers of the Worcester County Medical Society are **Robert LaMar, MD,** vice president; **Francis J. Townsend, Jr., MD,** secretary-treasurer; **Frank Gantz, MD,** delegate to the Medical and Chirurgical Faculty; **Dr. Sully,** alternate delegate; **Norman R. Sartorius, Jr., MD,** Planning Committee representative; and **Paul Cohen, MD,** Journal representative.

MITCHELL ROSENHOLTZ, MD, *Chairman, Editorial Committee*

The Genetics of Essential Hypertension

PETER RASMUSSEN, MD
Associate Professor of Pathology
University of Maryland School of Medicine

As physicians, we sometimes distort medical reality to suit preconceived notions which arise through the influence of our prior incomplete experience. Such distortions, for example, gave rise to early humoral theories of disease. Such a distortion also has been the case in descriptions of the nature of essential hypertension.

In the early part of the 20th century, as retrospective pathologic descriptions gradually agreed upon the similar morphologic aspects of this disease from patient to patient, and as family observations indicated that persons within the same family tended to resemble one another in adjacent generations with respect to morbidity and mortality phenomena accompanying higher blood pressures, the assumption gradually became accepted that the entity was largely determined by heredity and due to a single dominant gene. High blood pressure without obvious cause *seemed* to be a homogeneous disease entity.

Some studies[1] pointing to discrepancies in the inheritance patterns were often explained away as showing up the variable penetrance* of the gene or inadequate anamnesis in the study. Hamilton et al[2] were among the first to indicate that these discrepancies and others might be due to an inadequate genetic hypothesis. They postulated that rather than a single dominant gene causing actuarily earlier death from high blood pressure, several genes might be present which collectively are partly responsible for this elevation in pressure, and that similarities in individuals of families in the same or contiguous generations might be due to the sharing of these genes by parents and siblings. They also suggested that variability in the environment probably contributed substantially to the blood pressure variability which a given population might demonstrate. Thus, the discrepancies in the "dominant gene" hereditary patterns of individuals in so-called hypertensive families might be due in part to environmental differences among its members or to the breaking up or dilution of the necessary gene combinations during meiosis, or perhaps to both of these phenomena.

These investigators have argued that no one has ever successfully shown a bona fide dichotomy of hypertensives versus non-hypertensives in any population of humans. In fact, they have asserted, such a dichotomy does not exist; average blood pressure levels vary among people just as heights vary. Thus the clinical distinction of hypertensive and non-hypertensive is an impressionistic view of reality, just as calling people tall, medium, and short is a convenient classification; but it is impossible to document objectively as having any incisive trichotomous biological meaning. The selection of any single value in inches or centimeters to distinguish tall individuals from medium individuals would be completely arbitrary.

In addition to the above cited discrepancies of observed to predicted Mendelian segregation with regard to manifestations of high blood pressure, considerations from an evolutionary and population genetics point of view detract from the credibility of a single dominant gene's being the chief cause of blood pressure variability in a given random population. Considering the high

*Penetrance refers to the frequency with which a gene manifests itself in the population. A gene with low penetrance is present in chromosomes but often will not show any of its effects.

percentage of morbidity and mortality from high blood pressure (one review citing 5-25%[3]), the frequency of this single gene would have to be unusually high to account for these phenomena. Well-documented single dominant genes causing diseases which permit marriage and parenthood are not found to exhibit such high gene frequencies in affected populations. In order for a single detrimental gene to have reached even moderate frequency in a population, it usually must have been favorable at some time in the past and then become detrimental because of a change in environment; or it must be appropriately favorable in many persons of the population even though unfavorable in most; or it must have an unfavorable effect when in contact with some other genes in the population, the latter genes having come to the population from another population. None of these situations appears to have been the case in populations having significant morbidity or mortality because of higher blood pressure, although the higher hypertensive morbidity and mortality in the American Negro may be an exception.

Thus, reconsideration of the consequences of the inconsistencies in the single gene hypothesis directs one's attention to the only other alternative, in what appears to be a disease with at least partial genetic determination: a polygenic hypothesis. How can we physicians, as retrospective observers of disease (and pathologists as the most retrospective observers of them all), reconcile such a seemingly diffuse explanation with what we know to be the nature of this retrospectively distinctive clinicopathological entity, essential hypertension? The answer is, I believe, that polygenic inheritance need not imply diffuseness.

During the evolution of the total vascular system of *homo sapiens,* great numbers of selective environmental forces must have acted on the system in a detrimental fashion, the continuing result being successful survival and continuance of those favorable gene combinations which on the average reproduced themselves in greatest numbers. Therefore, as our contemporary human environment has changed and permitted greater longevity, formerly evolved complex genetic variability currently contributing to some unfavorable variability in the derived unit blood pressure would be a rather plausible course of events.

In contrast to the situation in the case of single genes, the survival of blocks of many genes relatively stable from generation to generation and favorable to the evolution of a biologic system, such as the vascular tree, appears to be the rule in the evolution of a genetically well integrated species such as man. Thus transmission of these blocks of genes occurs in much the same manner that single gene transmission does, although some blocks may break up or rearrange themselves during meiosis.

These disruptions of blocks give rise, in part, to the phenomenon which has come to be called penetrance. In the case of blood pressure morbidity, the rearrangement or breakup of polygenic blocks during meiosis might partly explain sporadic cases of hypertension or the familial aggregations of this entity which lack crisp Mendelian segregation. To say that any such system formerly evolving in favor of a population may later be responsible for death of individuals is only to restate what we know of life in complex organisms: that all such organisms die ultimately because of incompatibilities with their environments.

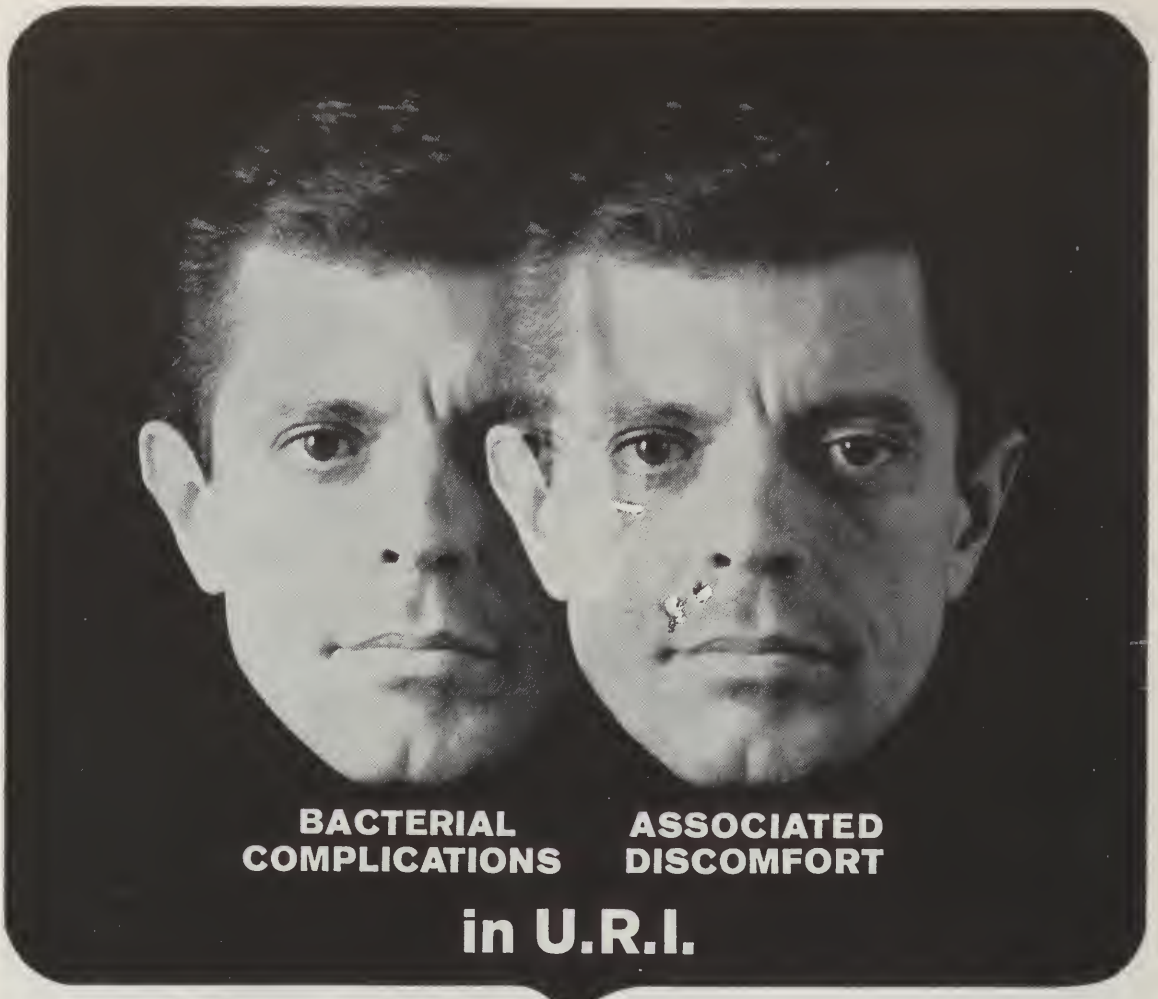
BALTIMORE, MARYLAND 21201

"All Interns are Alike"

It stands to reason. They all go through the same training; they all have to pass the same tests; they all have to measure up to the same standards; they all are underpaid, too. Therefore, all interns are alike.

That's utter nonsense, of course. But it's no more nonsensical than what some people say about aspirin. Namely: since all aspirin is at least supposed to come up to certain required standards, then all aspirin tablets must be alike.



Bayer's standards are far more demanding. In fact, there are at least *nine specific differences* involving purity, potency and speed of tablet disintegration. These Bayer® standards result in significant product benefits including gentleness to the stomach, and product stability that enables Bayer tablets to *stay* strong and gentle until they are taken.

So next time you hear someone say that all aspirin tablets are alike, you can say, with confidence, that it just isn't so.

You might also say that all interns aren't alike, either.

BRING THE TREATMENT TOGETHER
IN A SINGLE PRESCRIPTION

ACHROCIDIN®

Tetracycline HCl-Antihistamine-Analgesic Compound

Each tablet contains:			
ACHROMYCIN® Tetracycline HCl	125 mg	Caffeine	30 mg
Acetophenetidin (Phenacetin)	120 mg	Salicylamide	150 mg
		Chlorothen Citrate	25 mg

Effective in controlling complicating tetracycline-sensitive bacterial infection and providing symptomatic relief in allergic diseases of the upper respiratory tract. Possible side effects include drowsiness, slight gastric distress, anorexia, overgrowth of nonsusceptible organisms, tooth discoloration (if given during tooth formation), photodynamic reaction to sunlight and increased intracranial pressure (in young infants). Average adult dosage: 2 tablets four times daily, given at least one hour before, or two hours after meals. Patient should avoid direct exposure to artificial or natural sunlight; and should not drive a car or operate machinery while on drug. Reduce dosage in impaired renal function. Stop drug immediately at the first sign of adverse reaction.

A SERVICE OF
THE HEART ASSOCIATION OF MARYLAND

Post-Resuscitation Care After Cardiac Arrest

DONALD H. DEMBO, MD
Chairman, Closed Chest Cardiac Resuscitation Committee
Heart Association of Maryland

Total management of sudden death with expired air ventilation and closed chest compression must include intensive post-resuscitation care. A common experience has been successful restoration of spontaneous cardiac activity and respiration, followed by death within a few days from renal failure, central nervous system damage, electrolyte imbalance, or underlying disease.

Closed chest compression, even when adequately administered, produces only two-thirds of normal cardiac output. This reduced circulation when compounded by inadequate oxygenation results in brain, renal, and other tissue damage. During resuscitation one must maintain an adequate airway, provide continuous ventilation with high oxygen concentrations, and avoid pressure-cycled ventilation devices which function inadequately during chest compression. There must be frequent and repeated use of cardiotonic drugs (epinephrine at five minute intervals) to increase perfusion pressure. However effectively applied, metabolic acidosis occurs and should be combated with sodium bicarbonate given at 10-minute intervals.

In the immediate post-resuscitation period, hyperventilation is often observed as a respiratory compensating mechanism. Support of ventilation at this time with pressure or volume cycled equipment may be necessary. However, hyperventilation may induce respiratory alkalosis with a concomitant fall in serum potassium. This can produce serious arrhythmias, particularly in digitalized victims. Adequate equipment for resuscitation must, therefore, be able to monitor electrolytes and analyze blood gases and pH to permit corrective therapy when indicated.

The brain, highly sensitive to oxygen deprivation, must be protected in the post-resuscitation period. In the presence of confusion, stupor, or frank coma, further brain damage should be prevented through the use of hypothermia. Cerebral edema may be reduced by the intravenous administration of urea. Urine production should be monitored with an indwelling catheter. Should urine output fall below 30cc/hour, an osmotic diuretic such as intravenous mannitol should be administered promptly and output maintained by additional mannitol as required.

Continuous monitoring of cardiac rhythm will promptly detect arrhythmias and permit specific treatment. Cardiac arrest may reoccur. The use of maintenance anti-arrhythmic agents, such as quinidine or procaine amide, may be helpful. Vasopressors in concentrated solutions are useful in maintaining adequate blood pressure, but their vasoconstrictive effect in reducing renal, cerebral, and coronary blood flow dictates that they only be used when actually needed. They may be of particular value in cardiac arrest after myocardial infarction when severe hypotension persists. In long standing hypotension and shock, capillary damage may result in significant pooling of body fluids with loss in effective circulating blood volume and electrolytes. Central venous pressure monitoring with an indwelling venous catheter will permit therapy as required.

Treatment of the underlying disease cannot be neglected. Digitalis for congestive failure, anti-

For Physicians Offices

...the perfect building
...the perfect location

Ten-Ten is a new building which has already established itself as a prestige address. As a professional office location it is ideal. Ten-Ten is situated in the very midst of an already professional neighborhood and is outstanding in both appearance and facility. It offers your patients nearby convenient parking facilities and bus transportation stops at the door. No wonder it has been judged by many as the "perfect professional location" for physicians. Your personal investigation will bear this out to your complete satisfaction.

FEATURING:

- One of downtown's most attractive rental prices.
- Individually designed office suites, 400 sq. ft. and up.
- Private lavatory in each suite.
- Modern automatic elevator service.
- Attractive lobby with reception desk.
- 24-hours-a-day switchboard secretarial service.
- Convenient parking, eating places and other personal services.

dotes for drug reactions, when available, and other specific measures should be instituted. The value of large doses of steroids has not yet been determined.

There appears to be correlation between survival and the swiftness with which spontaneous cardiopulmonary activity is restored. Prompt application of adequate closed chest compression and ventilation in cardiac arrest reduces tissue damage and, therefore, lessens post-resuscitation problems. Careful attention to detail in applying emergency measures, definitive treatment, and post-resuscitation care will increase survival after cardiac arrest.

REHABILITATION Notes

REHABILITATION SECTION
BALTIMORE CITY MEDICAL SOCIETY,

DOUGLAS G. CARROLL M.D.
EDITOR

Recent Advances in the Rehabilitation of Rheumatoid Arthritis

Personal and Social Aspects of Rheumatoid Arthritis

*DOUGLAS CARROLL, MD and ROBERT BRULL**

It is part of the cure to wish to be cured.— Seneca c. 60 AD.

In previous Rehabilitation Notes, certain aspects of the physical examination in rheumatoid arthritis, the use of physical therapy, newer diagnostic advances, and the use of orthopedic and hand surgical procedures have been presented. The crucial importance of follow-up in preventing loss of range of motion has been emphasized.

It seems appropriate to end this series with a discussion of the effect of rheumatoid arthritis on total life adjustment. An excellent study of this subject is that of Ostro[1,2] who investigated 125 ambulatory patients attending two New York City arthritis clinics. He studied their vocational, economic, family, and social problems. Seventy-eight patients had rheumatoid arthritis, 30 had osteoarthritis, and 17 had miscellaneous rheumatic diseases. At the time of interview, 45 of the 81 employed prior to the onset of rheumatoid arthritis were not working. Only 15 patients were never unemployed during their illness.

The physicians were asked for a clinical estimate of the patient's ability to work, based not only on the degree of arthritic involvement but also on the total medical status of the patient. Thirty-five of the 45 who were considered able to work were actually employed. *An interesting finding was that the severity and duration of the disease did not seem to have a close correlation with employment status.* In addition to the arthritis, factors limiting employment were old age, other diseases, distance of travel, negative feelings about returning to work, and inability to perform skilled or long term jobs.

Social investigation and direction helped many of the patients to become self-supporting.

Of the 81 patients who were self-supporting when symptoms began, 64 suffered financially as a result of the arthritis. Only 19 patients remained self-supporting throughout their illness.

Sixty-five of the women performed all housework before the illness, but after the onset, only 27 (mostly with osteoarthritis) could continue a full load of housework.

Marriages suffered increased strain because of reduced income and the patient's loss of status in the family.

During the summer of 1965, a study was performed at the Baltimore City Hospitals to learn what factors had been most important in causing dependency in welfare patients with rheumatoid arthritis. Sixteen patients were interviewed at length. Their homes were visited when possible, and their medical records were reviewed. As might be expected, severity of the disease was not

*Mr. Brull is a second year medical student at the University of Maryland School of Medicine.

the only factor which precipitated dependency. A few of the patients would have been on welfare even if they had never had rheumatoid arthritis. Others made heroic efforts to remain independent. Other factors which influenced dependency were family stresses and educational and vocational limitations.

Family.—In about half the cases, the relationship between the patient and the family deteriorated when the patient became sick. Deterioration generally was caused not by the disease but by underlying interpersonal relationships. The disease frequently exacerbated underlying hostility.

Among the other half of the patients were examples of unshakable loyalty despite disease. One son gave up a college education to support his mother at home; a brother completely supported a patient in his own home for years.

Education and vocation.—No patient had completed high school. One-half had less than a sixth grade education. Only one patient had a job above laboring or domestic work.

As in so many patients with chronic diseases, the disease itself was not the major cause of disability but often was merely the straw which broke the camel's back. This group of patients had little education, limited intellectual endowment, and narrow vocational potential. There were wide variations in motivation, passivity, and dependency needs.

A recent sophisticated study[3] of 49 women with rheumatoid arthritis used the Minnesota Multiphasic Personality Inventory (MMPI). The patients were divided into two groups. In the first group, the stage of progression of the illness was less than the class of functional incapacity (using the American Rheumatism Association criteria). The second group consisted of patients whose stage of progression was greater than or equal to the class of functional incapacity. In other words, the first group seemed to be incapacitated by less progressive stages of rheumatoid arthritis than the second group. The two groups were then compared according to the MMPI. Certain differences were statistically significant.

In general, the first group (with severe functional limitations but relatively little progression of the disease) suffered a great deal of acute distress with a wide variety of psychological symptoms. These patients appeared to be unable psychologically to cope with the illness. They showed shyness, introversion, and alienation from self and others with decreased social participation and responsibility. Their increased anxiety, depression, and fear resulted in withdrawal from social contacts. They were more hostile and less able to control their impulses.

The second group (in which the degree of functional limitation was more appropriate to the advanced disease) showed less tendency to complain about physical symptoms, was less depressed, apathetic, and lacking in positive psychological resources.

The investigators concluded that the patient who best maintains function is able to cope psychologically with the disease. He does not manifest severe anxiety, depression, or dependency and tends to be an outgoing person despite his illness. Functional incapacity is associated with a breakdown of ego defensiveness and growing inability to cope with the symptoms.

The authors point out that patients with rheumatoid arthritis are far from homogeneous in psychological make-up. These generalizations may apply to any chronic disease and are not necessarily specific for rheumatoid arthritis.

SUMMARY

It is curious that the severity and duration of rheumatoid arthritis is not directly related to employability in ambulatory arthritis patients. A number of studies have shown that psychological and social factors are of major importance in determining how a patient with rheumatoid arthritis will perform in his environment. It is now clearly established that these factors are of almost equal importance with the disease process in predicting the performance of patients with rheumatoid arthritis. It is therefore incumbent on the physician to be sensitive not only to the patient's symptoms but also to the social and psychological setting in which they occur. Sometimes the latter factors may be modified more aptly than the progress of the disease.

Butazolidin® alka

Usually works within 3 to 4 days in osteoarthritis

henylbutazone	100 mg.
ried aluminum ydroxide gel	100 mg.
agnesium trisilicate	150 mg.
omatropine ethylbromide	1.25 mg.

he trial period need not exceed 1 week. In ontrast, the recommended trial period for ndomethacin is *at least 1 month*.

hat's why it's logical to start therapy with utazolidin alka—you'll know quickly whether r not it works. And usually, it will.

large number of investigators have reorted major improvement in about 75% of ases. Some patients have gone into remison. Relief of stiffness and pain may be folowed quickly by improved function and reslution of other signs of inflammation. And utazolidin alka is well tolerated, especially ince it contains antacids and an antispasodic to minimize gastric upset.

ontraindications
dema, danger of cardiac decompensation; istory or symptoms of peptic ulcer; renal, epatic or cardiac damage; history of drug llergy; history of blood dyscrasia. The drug hould not be given when the patient is seile, or when other potent drugs are given oncurrently. Large doses are contraindiated in patients with glaucoma.

recautions
btain a detailed history and a complete hysical and laboratory examination, including a blood count. The patient should be closely supervised and should be warned to report immediately fever, sore throat, or mouth lesions (symptoms of blood dyscrasia); sudden weight gain (water retention); skin reactions; black or tarry stools. Make regular blood counts. Use greater care in the elderly.

Warning
If coumarin-type anticoagulants are given simultaneously, watch for excessive increase in prothrombin time. Pyrazole compounds may potentiate the pharmacologic action of sulfonylurea, sulfonamide-type agents and insulin. Carefully observe patients receiving such therapy.

Adverse Reactions
The most common are nausea, edema and drug rash. Hemodilution may cause moderate fall in red cell count. The drug may reactivate a latent peptic ulcer. Infrequently, agranulocytosis, generalized allergic reaction, stomatitis, salivary gland enlargement, vertigo and languor may occur. Leukemia and leukemoid reactions have been reported but cannot definitely be attributed to the drug. Thrombocytopenic purpura and aplastic anemia may occur. Confusional states, agitation, headache, blurred vision, optic neuritis and transient hearing loss have been reported, as have hepatitis, jaundice, and several cases of anuria and hematuria. With long-term use, reversible thyroid hyperplasia may occur infrequently.

Dosage
The initial daily dosage in adults is 300-600 mg. daily in divided doses. In most instances, 400 mg. daily is sufficient. When improvement occurs, dosage should be decreased to the minimum effective level: this should not exceed 400 mg. daily, and is often achieved with only 100-200 mg. daily.

Also available: Butazolidin®,
brand of phenylbutazone
Tablets of 100 mg.

Chronic Bronchitis

JOHN P. LIGHT, MD

Chronic bronchitis is a long-standing disease of the tracheobronchial tree characterized by hypersection of mucus by the goblet cells of the submucosa of the respiratory tract. The stimulus for this excessive secretion of mucus is thought to be repeated insults to the tracheobronchial tree by bacterial, viral, or physical agents, such as polluted air or cigarette smoke.

Clinically, chronic bronchitis is characterized by a long history of cough and sputum production associated with recurrent respiratory illnesses and progressive dyspnea. The disease increases in frequency with age and occurs more often in men than in women. Pathologically, the mucous glands become hypertrophic, their ducts dilate, and the orifices of these ducts widen. Histologic examination of the bronchial submucosa reveals fibrous hyperplasia and thickening of their walls. Peribronchial inflammatory changes may be observed and occasionally peribronchial abscesses form.

Chronic bronchitis is often the precursor of destructive emphysema, affecting the area of attachment of the respiratory tissue (alveolar ducts and alveoli) to the bronchial tree (terminal bronchioles and respiratory bronchioles). The damaged bronchiolar walls retract, thus forming spherical spaces which, in turn, give rise to the centrilobular type of destructive emphysema. The prognosis for this disease is grave; death usually is attributable to pulmonary infection or cardiorespiratory failure.

From the Department of Radiology, University of Maryland School of Medicine.

In several large studies based on plain x-ray films of the chest of patients with proven chronic bronchitis, almost half show no radiographic abnormality. Sometimes there is evidence of pulmonary damage secondary to chronic bronchitis, ie, emphysema. The radiologic changes seen in pulmonary emphysema are related to hyperaeration of the lungs: little change in the appearance of the inspiratory and expiratory films, flattening of the diaphragm, small cardiac silhouette, widened intercostal spaces, prominence of the central pulmonary arteries, and attenuation of the distal pulmonary vessels. Tuberculosis, carcinoma, and bronchiectasis clinically may mimic chronic bronchitis, and the chest film helps to eliminate these possibilities.

Direct signs of chronic bronchitis may be seen occasionally on the plain chest film. There may be generalized tubular shadows seen coursing parallel to arteries, reflecting the abnormally thick bronchial walls. When seen in *en face,* these may have a ring appearance and are usually observed in the upper third of the lungs. These small densities may be interpreted as "granulomatous scars" if not examined carefully. The areas of parenchymal scarring described by the pathologist in chronic bronchitis are probably too small to be demonstrated radiographically. More rarely, a fine reticular pattern may be observed, especially in the lower lobes. This is caused by fibrotic areas about the alveolar walls or crowding together of the vessels by adjacent emphysematous areas.

The pathology of chronic bronchitis can be demonstrated by bronchography. The most characteristic change is opacification of the dilated

Fig 1

Bronchographic opacification of dilated mucous gland ducts in chronic bronchitis.

mucous gland ducts, seen as numerous small spikelike projections from the normally smooth bronchial wall (fig 1). The changes are best demonstrated in the main stem and lobar bronchi. Bronchiolar ectasis may be demonstrated bronchographically by a grapelike peripheral pooling of contrast material. These small spherical pools vary in size from several millimeters to a centimeter.

Occasionally the margins of the peripheral pool of contrast may not be smooth but may show a finely frayed edge having the appearance of mimosa blossoms (fig 2).

Another bronchographic characteristic of chronic bronchitis is the abrupt and sharp termination of a peripheral bronchus (the "broken bough" appearance) (fig 3). These clear-cut endings may be caused by intraluminal mucus or secondary to air trapping from an obstruction more distal in the bronchiole.

Bronchi which possess a beaded appearance

Fig 2

Mimosa blossom pattern in chronic bronchitis due to bronchiolar ectasia.

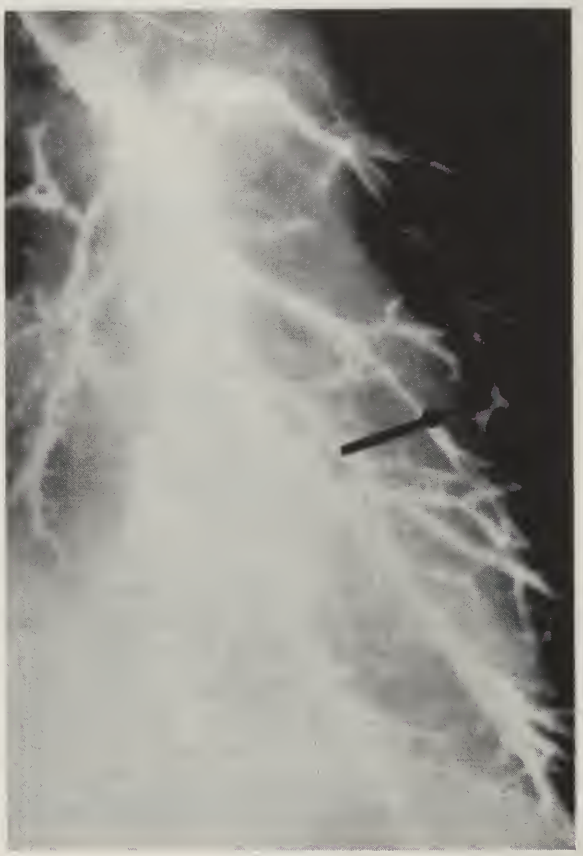

Fig 3

Abrupt termination of peripheral bronchi (the "broken bough" appearance) in chronic bronchitis.

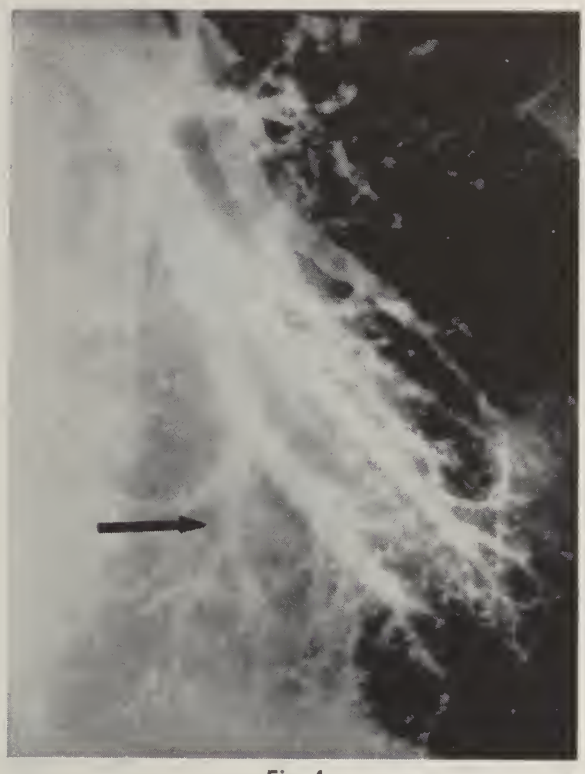

Fig 4

Beaded appearance of bronchi in a chronic bronchitic due to alternate areas of dilatation and narrowing.

may be seen. This reflects alternate areas of dilatation and narrowing due to bronchial wall thickening and retraction (fig 4). These peripheral bronchographic findings may be generalized or focal and should not be confused with alveolar filling which may occur with the use of bronchographic agents of low viscosity.

Cinebronchographic studies have made possible the observation that most bronchitic subjects show a disproportinate tendency to collapse their third stage bronchi with cough, expiration, and the Valsalva maneuver. This tendency is present to a lesser extent in the main stem bronchi and even the trachea.

In summary, chronic bronchitis is a serious disease of the tracheobronchial tree secondary to repeated biological or physical insults leading to excessive secretion of mucus and often to the centrilobular type of destructive emphysema and ultimate cardiorespiratory failure. Chronic bronchitis is rarely diagnosed by means of the plain chest film; however, pathognomonic changes can be demonstrated readily by bronchography.

The Science of Communication as practiced at Monumental Printing

It's more than a science: it's an Art, the precise transliteration in print of an intangible idea for a heterogeneous group of critical readers.

Here, at Monumental Printing, we learned to handle the tools of intelligent communication by the emperical method: working with them. The brush and palette of our art, the chisel, the score, the script are simply words on paper. We learned their proper use over 50 years of practice by being permitted to print such Journals as:

Clinical Chemistry
Digestive Diseases
Fertility & Sterility
Occupational Medicine
Leprosy
Mental Hospitals
Psychiatric Studies and Projects
Psychosomatic Medicine

We speak your language. We know the difference between edema and enema; syndrome and symptom; sewage and sewerage. And when and why we should use 12 point Caslon Bold instead of 10 point Stymie.

If you, too, need a good printer, let's communicate!

Alcoholism
SECTION

From the Subcommittee on Alcoholism of the Medical and Chirurgical Faculty of the State of Maryland

TOWARD A COMMUNITY ALCOHOLISM PROGRAM

DAVID TRACHTENBERG, MD
Director
Montgomery County Health Department
Alcohol and Drug Dependency Program

ONE MAJOR DIFFICULTY in creating a comprehensive public health program for alcoholics is that they are indeed many and varied. No *simple* service is adequate to meet their needs.

To illustrate the multiple facets of service needed by every community, we might describe a typical family in which there is an alcoholic. Our subject, V.O., is a 37-year-old man, separated from his wife and four children. His drinking began 20 years ago, but both he and his family agree that he has been a *problem* drinker perhaps for only 10 of those years. He is a high school graduate, and for most of his working life has been a skilled electrician. Before his problem drinking began he was considered an excellent worker: honest, exceptionally diligent, and responsible; if anything, he worried a bit too much about doing a good job. Through his industry and ability, he provided well for his family. A "nice guy," he was well liked by all who knew him.

In taking this history, we discovered what may be a coincidence, that he began to drink more and more heavily shortly after he expanded his business. We also noted that during this same period his father died suddenly.

We encountered V. O. after he had been separated from his wife for about two years. The wife has the children and works. The children's school performance has been slowly deteriorating. The 16-year old boy had recently been in a little trouble with some friends, involving racing a car and drinking some beer.

V. O. has lived in a rooming house, or in several rooming houses. In the two or three months a year in which he went on the wagon, he managed to pick up some work of one sort or another, some of it in simple electrical jobs (he had fallen behind technically). In the past six months, however, he has been drinking constantly, scrounging money wherever he could to buy cheaper and cheaper wine, eating irregularly or not at all, losing weight, and recently developing weakness and numbness of the hands and feet.

We might have met our subject in the emergency room of a hospital, brought there by the police, who had picked him up as drunk and disorderly. The police would have brought him to the emergency room on that day because they noticed that in jail he was becoming more and more unsteady, had developed severe tremor of

both hands and head, and seemed confused and frightened. Correctly they diagnosed him as being in early DT's.

This case, obviously typical, illustrates the varied needs of any treatment program. What are we to do with this man?

PRELIMINARY TREATMENT

Medical evaluation reveals that he is indeed in early delirium tremens (fatal in 25% of the cases if left untreated). He may soon go into convulsions or become acutely and dangerously agitated. He is seriously malnourished, with signs of early beriberi, and perhaps close to liver decompensation. Obviously he needs an inpatient medical facility which is also equipped to handle his agitated mental state. He could be expected to stay in such a facility for up to three weeks. On discharge he would be walking steadily, clear headed, and reasonably well nourished.

Discharged from the hospital with nowhere to go, with only alcoholic friends, with no emotional shoring up, he would almost certainly return to drinking. What he needs now is a more prolonged stay in a rehabilitation facility for social, psychological, and vocational evaluation, education concerning his disease, and introduction to the various therapies, including Alcoholics Anonymous. This segment of his treatment can best be conducted in a specialized alcoholic rehabilitation unit, such as those operating in our state hospitals.

Let us suppose that he remains in such a facility for six weeks. Together with his period of medical hospitalization, he has been in the hospital for more than two months. Where is he now? Physically he is feeling well; emotionally, he has had time to settle down and feels more confident and at ease in the hospital setting. He has learned a little about alcoholism and perhaps

begins to see how the various forms of treatment can help him in the future. For our part, we have learned a lot more about what's the matter with him and about how he came to drink. We have evaluated his family and home situation. We have investigated his vocational potential and we perhaps can begin to write a treatment prescription at this time. Notice that we have treated him medically, have given him a bit of education and some rest, and that is all. At this point we have essentially taken care of his immediate past but have done nothing for his future.

Our subject perhaps wants to go back to his home town but has no money, no job, no training; and his wife is understandably reluctant about allowing him back in the home. He still carries with him the internal conflicts and problems which initially led to his abnormal drinking.

The next stage in treatment might best occur in a half-way house in or near his community, where he would continue to receive support from other alcoholics who are doing well and from the half-way house manager and staff, themselves arrested and productive alcoholics. He might stay there for a number of weeks, perhaps a few months, while vocational rehabilitation was helping him to acquire the education and experience necessary to re-establish him as a capable electrician and to find a job. This accomplished, he might look around for suitable quarters outside the half-way house. By this time he has made new friends and no longer confines his relationships to other drinking alcoholics. He has been strengthened in his ability to deal with other people by his continuing association in AA and his attendance at an outpatient clinic, where he has participated in group therapy sessions. His occasional compelling impulses to drink are thwarted because he is taking his Antabuse regularly.

THE FAMILY PROBLEMS

V. O.'s family is beginning to notice that he is working and sober. His wife is still frightened about going back into that fearful drinking rut, but her own anxiety has been relieved by her attending Al-Anon sessions, where she herself has learned more about alcoholism and what she can do to help her husband.

It may be that one day the couple resolve to try it again, but this time they can do so with the assistance of family group therapy, where both husband and wife, along with other husbands and wives, discuss and work out their problems: the tensions, resentments, hurt feelings, and destructive patterns of interaction which have developed over the years and, unassisted, might continue to operate. Helping their chances for success in living together are visits from the public health nurse who, as an independent observer in the home, often can recognize early signs of serious degeneration in the family system.

While we are congratulating ourselves on how well V. O. and his wife are doing, we notice, however, that his 16-year-old son seems to be drinking more. He has again gotten into trouble with a bunch of boys, and his school grades are not improving.

We can, of course, chalk this off to youthful enthusiasm, childhood pranks, or laziness, except that we know that children of alcoholics, who drink, are more likely to become alcoholics themselves. We would be even more alarmed if both parents drank, because then we would know the odds would be one out of four. Perhaps a parent, school counselor, or juvenile court worker might alert those in the alcoholic program of what may be early signs of problem drinking or of maladjustment or problems in general. The boy could perhaps be evaluated and encouraged to participate in Alateen or, if necessary, become a clinic patient in a group with other early problem drinkers.

Using this clinical example, we have described the basic facilities of a community treatment program for alcoholics: 1) a medical inpatient unit to include detoxification facilities; 2) an inpatient alcoholic rehabilitation unit for extensive evaluation, education, and initiation of treatment; 3) outpatient clinic facilities offering primarily group psychotherapy for alcoholics and their families; 4) a half-way house to function as the bridge between inpatient facility and community; 5) educational programs to alert the population in general to the dangers and early signs and symptoms of alcoholism and to facilitate the identification of alcoholics in the various stages of their illness.

An eminent role in medical practice

- Clinicians throughout the world consider meprobamate a therapeutic standard in the management of anxiety and tension.
- The high safety-efficacy ratio of 'Miltown' has been demonstrated by more than a decade of clinical use.

Miltown® (meprobamate)

Indications: 'Miltown' (meprobamate) is effective in relief of anxiety and tension states. Also as adjunctive therapy when anxiety may be a causative or otherwise disturbing factor. Although not a hypnotic, 'Miltown' fosters normal sleep through both its anti-anxiety and muscle-relaxant properties.

Contraindications: Previous allergic or idiosyncratic reactions to meprobamate or meprobamate-containing drugs.

Precautions: Careful supervision of dose and amounts prescribed is advised. Consider possibility of dependence, particularly in patients with history of drug or alcohol addiction; withdraw gradually after use for weeks or months at excessive dosage. Abrupt withdrawal may precipitate recurrence of pre-existing symptoms, or withdrawal reactions including, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, the dose should be reduced and operation of motor vehicles or machinery or other activity requiring alertness should be avoided if these symptoms are present. Effects of excessive alcohol may possibly be increased by meprobamate. Grand mal seizures may be precipitated in persons suffering from both grand and petit mal. Prescribe cautiously and in small quantities to patients with suicidal tendencies.

Side effects: Drowsiness may occur and, rarely, ataxia, usually controlled by decreasing the dose. Allergic or idiosyncratic reactions are rare, generally developing after one to four doses. Mild reactions are characterized by an urticarial or erythematous, maculopapular rash. Acute nonthrombocytopenic purpura with peripheral edema and fever, transient leukopenia, and a single case of fatal bullous dermatitis after administration of meprobamate and prednisolone have been reported. More severe and very rare cases of hypersensitivity may produce fever, chills, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, anaphylaxis, stomatitis and proctitis. Treatment should be symptomatic in such cases, and the drug should not be reinstituted. Isolated cases of agranulocytosis, thrombocytopenic purpura, and a single fatal instance of aplastic anemia have been reported, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity has been reported, usually after excessive meprobamate dosage. Suicidal attempts may produce lethargy, stupor, ataxia, coma, shock, vasomotor and respiratory collapse.

Usual adult dosage: One or two 400 mg. tablets three times daily. Doses above 2400 mg. daily are not recommended.

Supplied: In two strengths: 400 mg. scored tablets and 200 mg. coated tablets.

Before prescribing, consult package circular.

RAY HEPNER, M.D., Editor

Preventable Neonatal Infections

Only by an awareness and constant surveillance of sources of infection and the use of techniques mentioned can one hope to combat the rise in the frequency of infections brought about in part by the increased use of hospital facilities, shortages of personnel and the increased use of mechanical equipment, parenteral fluid therapy and broad spectrum antibiotics.

S. WAYNE KLEIN, MD

Despite attempts to lower neonatal mortality, infections continue to be a primary cause of neonatal deaths. Particularly disturbing is the increasing frequency of reports of nursery infections due to the so called "soil and water" bacteria (*Flavobacterium, Achromobacter, Paracolon, Herella, Pseudomonas*). Reports of these organisms from the laboratory send the clinician back to his bacteriology book, where he is informed that these organisms are saprophytes and usually nonpathogenic for man.

Today, these soil and water organisms are responsible for severe and often fatal infections in both premature and full-term infants. All grow well wherever there is sufficient warmth and moisture. Humidifying chambers in incubators, oxygen administration equipment, sinks, sink traps, faucet aerators, and resuscitation and inhalation equipment are ideal for the growth of these organisms and, indeed, all have been reported as sources of infections for outbreaks of neonatal infections.

Recent studies of septicemia in the premature infant[1] have shown that a fourfold reduction in such waterborne infections can be achieved by the application of the following procedures.

1. Perform routine bacteriological survey.

All items that come in contact with water should be cultured routinely, not only in the nursery but also in the delivery rooms. This both locates possible sources of infection and monitors the effectiveness of the procedures used to eliminate these "water bugs" from the environment. Any item that is wet should be cultured.

2. Replace all tubing in traps on suction devices after each use.

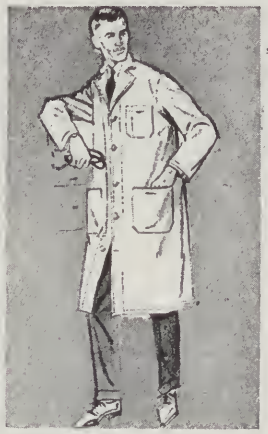
Suction machines and resuscitators can be eliminated as a source of these organisms by establishing a routine which requires the replacement with sterile material of all tubing from the suction catheter down to the suction motor or wall outlet including the suction trap.

3. Replace oxygen humidifying bottles.

Oxygen humidifying bottles should be changed daily with sterile bottles, tubing, and water and never used for more than one patient.

4. Don't refill soap dispensers.

Soap dispensing bottles and other containers



Dr. Klein is assistant professor of pediatrics, The Johns Hopkins University School of Medicine, and assistant chief of pediatrics, Baltimore City Hospitals.

should never be refilled but should be replaced with a sterile bottle containing fresh solution.

5. Use diluted acetic acid instead of sterile water in humidity reservoirs.

The use of 0.001 molar acetic acid inhibits the growth of gram negative organisms, especially pseudomonas, but is harmless to both infant and humidifying reservoir. (To prepare 0.001 molar acetic acid: add 4.0ml of a 2% solution of acetic acid to 1000ml of sterile water. This solution has a pH of 3.8 to 4.0).

Implementation of these procedures along with those previously recommended by the American Academy of Pediatrics[2] should eliminate many sources of gram negative infections. These techniques apply also to other hospital areas, such as intensive care units, where highly susceptible patients are located.

Maternal Welfare.

Instructive case histories submitted by Subcommittee on Maternal Welfare

JOHN WHITRIDGE, JR., MD, chairman

Cases 8 and 9—Anesthesia Accidents

The first patient was a 25-year-old primigravida whose prenatal course was uneventful. She was admitted to the hospital in active labor at 2:45 AM on February 12, with the cervix 2-3cm dilated. General physical examination revealed no abnormalities. At 3:40 AM, the cervix was 5-6cm dilated, blood pressure 150/100. She was given 100mgm of Demerol and 3 grains of Seconal.

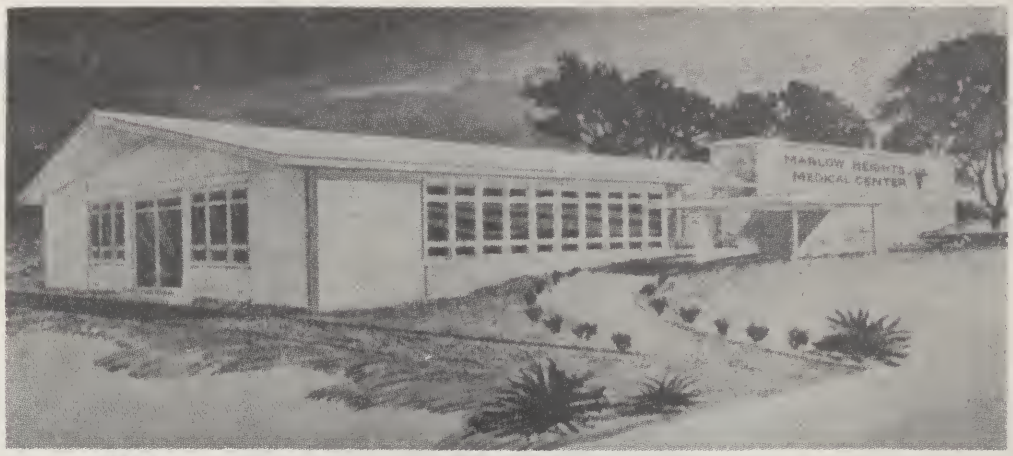
At 4:20 AM caudal anesthesia was begun by a resident physician and was completed at 4:30 AM. A total dosage of 20cc of metycaine was administered. Upon completion of the anesthesia administration, the cervix was fully dilated with the presenting part at the spines. Ten minutes after completion of the anesthesia, the patient appeared quite uncomfortable and vomited 200cc of greenish fluid. At 4:45 PM the blood pressure was recorded at 140/100 and the pulse strong and regular.

Five minutes later she became restless, began having labored respirations, and the pulse became irregular and feeble. She was given intravenous adrenalin, 1cc, and positive pressure oxygen was begun. Another five minutes later the patient's condition was critical, with the pulse not perceptible and heart sounds questionable. Her pupils were dilated and the corneal reflexes were absent. At 5 AM no pulse or heartbeat could be definitely noted, and at 5:10 AM respirations ceased and she was pronounced dead.

Since the fetal heart was still determined at 60 per minute, a cesarean section was performed with the patient in her bed, and at 5:20 AM a 6lb 6oz boy was delivered, who could not be successfully resuscitated.

Autopsy yielded no positive findings other than mild pulmonary edema and congestion of the lungs. A subsequent laboratory report demonstrated metycaine in the spinal fluid.

The second patient was 28 years old, para 5, gravida 6. She had received prenatal care from her family physician for six months before her admission to the hospital, at 10:30 PM on June 10. The prenatal course had been uneventful. On admission to the hospital she was in active labor, and the general physical findings were normal. She was given the usual preparation for delivery and taken to the delivery room at 11:50 PM, fully dilated.



Ethylene and oxygen were administered, and soon thereafter the patient began vomiting. The chief anesthetist was summoned. It was thought that the patient had aspirated a large amount of semi-digested food. She was pronounced dead at 12:40 AM, June 11.

We do not know what attempts were made to clear the air passages or what other treatment was given between the time the patient began vomiting and the time of death. Autopsy was not performed.

COMMENTS

These two cases illustrate the all too frequent consequences of accidents of anesthesia. The need for skilled, trained persons to administer obstetric anesthesia is often overlooked. The committee voted both of these to be preventable maternal deaths on the basis of improper administration of anesthesia.

In the first instance, although such a mistake could happen in the best of hands, the experience of the resident physician in administering caudal

anesthesia, presumably without supervision, is open to question. In the second instance, it should be an inflexible routine of any maternity service to ask patients in labor when they had last eaten solid food. Recognizing that the emptying time of the stomach is delayed in patients in early labor, inhalation anesthesia should not be administered when food has recently been eaten without first carrying out gastric lavage.

Highlights

IMMUNIZATION RECORD FORMS AVAILABLE IN QUANTITY

A supply of wallet-size immunization record forms for patients is available to Maryland physicians through the State Health Department. Space is provided for the first successful smallpox vaccination date, revaccination, and the physician's signature. Also included are spaces for each inoculation against diphtheria, whooping cough, measles, tetanus, and poliomyelitis, and blanks for any other immunization doses.

Under the patient identification lines is a section for information regarding any special sensitivity, allergy, disease, or condition which should be known to a physician giving emergency treatment. A note stresses the importance of follow-up inoculations and advises that the form be taken to the physician and updated each time a vaccination or revaccination is administered.

Forms may be requested in quantity from local health departments or from the Division of Epidemiology, Maryland State Department of Health, 301 W Preston St, Baltimore, Md, 21201.

HEPATITIS

The Division of Epidemiology assisted in investigating an outbreak of infectious hepatitis in a development of some 70 families in the southern part of Harford County. The Public Health Service officer attached to the Division, with the help of county health nurses and sanitarians, made a complete census of the population, collected 140 blood specimens for liver function tests, gave gamma globulin to 160 household contacts, and inspected water supplies. Twenty-five persons gave a history of illness with jaundice in recent weeks; 16 persons gave a positive liver function test but no history of jaundice, and a sampling of the wells showed heavy contamination. The attack rate of 10% or more is unusually high.

Although the study is not finished, evidence points to the private water supplies as the possible vehicle of transmission. Residents with contaminated water supplies were advised to boil drinking water and were given instructions in starting procedures to disinfect the soil and destroy the bird roost.

HISTOPLASMA INFECTED SOIL FOUND IN BALTIMORE COUNTY

Soil in a six-acre wooded lot which had been used on a massive scale as a roost by starlings and grackles was found to be contaminated with the fungus, *Histoplasma capsulatum.* This could constitute a health hazard if children and pets play in the area or if the soil is disturbed. Preventive steps taken by health authorities include: quarantine of the area, notification of residents and students of nearby schools of the risk, plans to skin test students and residents of the area, a study of the nature of the soil infection, and starting procedures to disinfect the soil and destroy the bird roost.

PAYMENT FOR TISSUE SPECIMEN EXAMINATIONS

logical examinations of tissue specimens from outpatients of health clinics unable to pay for these diagnostic services. Such payments were discontinued on September 1, 1965. Arrangements now have been made for the Department of Pathology of the University of Maryland Medical School to perform these examinations at a mutually satisfactory charge.

DAILY MAILING OF PKU SPECIMENS REQUESTED

It has been found that the mailing of PKU test specimens "within one week after collection" (as required by the Department's Regulations 43B02, effective August 1, 1965) is so late that confirmation of the diagnosis and initiation of treatment may not be in time to prevent serious mental retardation. A change from weekly to *daily* mailing of specimens has been requested. Specimens should be addressed to: Bureau of Laboratories, Maryland State Department of Health, 16 E. 23rd St., Baltimore, Md., 21218, Attention: Bioassay Laboratory.

Eleven cases have been discovered under the state's screening program of newborn infants.

THIRTY-EIGHTH PACKAGED HOSPITAL PLACED

A 1962 model packaged disaster hospital was pre-positioned in Port Deposit to augment the disaster capability of Cecil County. This 200-bed unit makes a total of 38 such units located in the state. Valued at $45,000, it is one of the 750 new hospitals being placed throughout the country by the Public Health Service. The Department's Office of Health Mobilization arranges for location and surveillance of packaged disaster hospitals in the state as one aspect of its program to assure the provision of essential health services in the event of a large scale disaster.

LEPROSY

A case of leprosy was reported through the Baltimore City Health Department. The patient was a young alien who had been in the area about 18 months. The diagnosis was made by a Baltimore dermatologist. The patient was hospitalized in Baltimore for three weeks and then sent to the Public Health Service Hospital at Carville.

New Immunization-Birth Record Card

Recent studies by the Baltimore City Health Department indicate that the immunization level among preschool children in Baltimore ranks high compared with other large cities. To further improve this good record and to provide individuals with a permanent certificate of immunization, a "Birth Certificate Follow-up Plan" has been devised, which emphasizes the maintenance of proper immunizations throughout infancy and childhood.

Beginning this month, an IBM size *Notification of Basic Immunizations* card, in addition to explanatory material, is being sent to the parents of each newborn baby in Baltimore. Parents are urged to seek the care and counsel of a private physician, pediatrician, or clinic of their choice to provide immunizations for their new baby.

It is important for the success of this new program that this postage-paid immunization card be dated, signed, and returned to the City Health Department upon completion of the basic immunization series, which includes a series of three DPT and polio immunizations.

When the City Health Department receives the completed IBM form, it will send a permanent, wallet-size, plastic *Birth Registration—Immunization* card to the parent. On the reverse side of the card is space for the family physician to record future immunizations, including smallpox and measles. This card then becomes a valid immunization record which will be acceptable to school authorities when the child is ready to enter school.

DR. GLADUE APPOINTED

J. Raymond Gladue, MD, has been appointed to the staff of the City Health Department's Medical Care Section in the capacity of medical supervisor of nursing homes.

A native of Woonsocket, RI, Dr. Gladue received his medical degree at the University of Rochester in 1949. He served his residency at Baltimore City Hospitals and in 1953 became staff physician at the Veterans Administration Hospital in Baltimore. In 1960 he entered the practice of internal medicine, specializing in diseases of the chest. In addition to his private practice, he was medical director of Jenkins Memorial Hospital for chronic diseases, chief of Somatic Services at Springfield State Hospital, and medical consultant to the Social Security Administration's Disability Section.

In his new post, Dr. Gladue will be concerned with the placement of patients in nursing homes and improving their care. He will work closely with nursing home administrators and physicians.

DR. J. WILFRID DAVIS RETIRES

On October 31, after 22 years of service in the Baltimore City Health Department, J. Wilfrid Davis, MD, MPH, assistant commissioner of health, retired from his post as director of the Medical Care Section.

Dr. Davis's work in the Baltimore City Health Department began December 1, 1943, as director of the Bureau of Communicable Diseases. His rich experience in working with physicians in private practice earned their close cooperation and esteem. He rendered outstanding service in this position, which he held until 1948.

On June 2, 1948, he was appointed director of the City Health Department's Medical Care Sec-

tion. In this capacity he built an efficient department which now serves more than 70,000 indigent persons and involves the services of 700 physicians, seven hospitals, and 500 pharmacies in providing medical care. The task was not easy because the provision of medical care for welfare clients under the auspices of the Health Department was a new service and not yet widely accepted in the United States. But through perseverance, Dr. Davis gave our city a medical care service which is one of the finest of its kind in the United States.

Medical Assistance to the Aged was added to his bureau's services on June 1, 1961. This program has grown until it now assists almost 9,000 elderly persons who are eligible for services.

Dr. Davis was born in Nova Scotia and received his early education in the public schools of that province and at Regina Normal School. For three years he served in the Canadian army, and most of this time was spent in Europe during World War I. In 1924, he received his medical degree from Dalhousie University, Halifax, Nova Scotia, and spent the next three years in private medical practice with part time service in county health work.

He began then to devote his energies to public health work. He attended the Rockefeller Foundation Public Health Field Training School in Mississippi in 1928. The following year he was appointed to the staff of the Kentucky State Board of Health as assistant director of the Bureau of County Health Work. Later he served as health officer of Fayette County and held an appointment on the medical staff of the University of Kentucky. Following this service he worked with the West Virginia State Health Department. From 1932 to 1937, Dr. Davis was field director for the W. K. Kellogg Foundation in Michigan.

Dr. Davis received the degree of Master of Public Health from the Johns Hopkins School of Hygiene and Public Health in 1937. He was director of the Marion County Health Department, in West Virginia, until he came to Baltimore in 1943. Throughout his years with the city, Dr. Davis has proven to be a capable administrator, a highly esteemed public servant and, perhaps above all, a humanitarian.

STATE OF MARYLAND

Department of Mental Hyqiene

Patient Mortality

PER CENT DYING DURING 18 MONTH OBSERVATION PERIOD

		PATIENTS ADMITTED WITH A DIAGNOSIS OF		
Age (in years)	Total Maryland Population	Alcoholic Disorders	Psychotic Disorders	Psychoneurotic and Personality Disorders
25-34	0.2	1.7	0.5	1.1
35-44	0.5	4.1	1.6	2.6
45-54	1.2	7.5	4.6	2.4
Total	0.6	4.9	2.0	1.9

Mortality among patients in Maryland's mental hospitals has remained at a high level in recent years despite a gradual, continuing shift from a chronic, long term population to one admitted for acute, short term treatment services. Last year 1,002, or 9.3% of the patient population, died while hospitalized.

Related to this high rate is the large number of deaths within a short period after onset of hospitalization. One out of every seven deaths occurs during the first month after admission. It is apparent that many newly admitted patients, particularly the elderly, have major physical disabilities and illnesses, are poorly suited for mental hospital care, and should more appropriately be placed in nursing type facilities or in homes with medical and other supportive services.

However, mortality is high among patients regardless of whether death occurs while hospitalized or in the community after release. The table from a recent study* shows the per cent of some selected patient cohorts who died within 18 months after admission to the three major Maryland state mental hospitals. It should be noted that six out of 10 deaths occurred in the community after hospital release. Comparable figures for the total state population for an 18-month period were supplied by the Maryland Health Department.

Mortality in each diagnosis-age group was substantially higher than comparable rates for the general population. This disparity was particularly pronounced among alcoholic patients where death rates were at least six times greater than similar rates for the total Maryland population. Many psychiatric hospital patients come from poor, deprived population groups concentrated in inner city areas. Mortality here is known to be higher than for the state as a whole. However, this by itself cannot explain the much larger patient death rates. A number of questions remain unanswered, and further investigations are indicated:

1. Is there a significant difference in the life expectancy of mental patients and comparable general population cohorts?

*A Psychiatric Case Register Study Of Release And Return Rates For State Mental Hospital Patients, presented at the annual meeting of the American Public Health Association, October 18, 1965.

The New Patient

WILBURN L. McCLURE, JR.

I tried playing a little game the other week. Every time I met a physician, I asked him what he thought was the most important thing in welcoming new patients. The answers I got ran something like this:

A well-decorated reception room.

A friendly greeting by the physician.

Soothing music in the office.

Up-to-date magazines in the rack.

All well and good. Those things are fine for every person you serve. But what do you do that's *special* for the first-time patient in your office?

In a lot of ways, the new patient is a special creature. Unlike your regular patients, he doesn't know a thing about you—whether you're fast or slow, gentle or rough. But he'll learn quickly enough from your first few appointments.

Try these three suggestions on your new patients:

1. LET THE NEW PATIENT PICK THE INITIAL APPOINTMENT TIME. When he first calls, your assistant should ask him when he wants to come, not tell him when you can finally manage to squeeze him in.

This makes Mr. New feel pretty good. He thinks he can have any time he wants. Of course, he can't. If the time he picks is impossible, a sharp assistant can easily switch him to another spot. But she should try to accommodate him even if it means shifting some other appointments.

2. BE READY FOR YOUR APPOINTMENT ON TIME. Everyone runs behind on his schedule now and then. But when you have a new patient coming, make a special effort to be ready and waiting for him. Your assistant can put a star in front of his name in the appointment book as a reminder.

It's always nice to make your appointments on time, but it's doubly important with a new patient. He's got a problem but, unlike the patients you're already treating, he doesn't know how serious or expensive it's going to be. As he sits there in your waiting room, he's a troubled man. The longer he sits, the more troubled he becomes.

3. SCHEDULE SOME EXTRA TIME FOR THE NEW PATIENT, BEYOND WHAT YOU NEED FOR THE TREATMENT. This is the get acquainted period, the time when you and the patient get to know one another. It's vitally important.

When you are scheduling time for the initial appointment, don't schedule any others in your second examining room. Maybe you will "waste" five minutes waiting for an injection to take, but that's better than having the patient feel you deserted him for someone else.

All of this sounds like the new patient is getting the red carpet treatment. Indeed he is, and he likes it.

When he knows you and your office routine better, he'll come to understand that he can't have any appointment time he picks, that you're just human enough to run behind in your schedule, or that you sometimes step into another examining room to give an injection or make an adjustment. And it won't bother him at all.

One thing more: Every once in a while—just as often as your time permits—TRY TREATING YOUR OLD PATIENTS LIKE NEW PATIENTS. They'll love it!

The tell-tale lesion on the back of her neck

ARISTOCORT Topicals are particularly effective in controlling the inflammatory symptoms of many dermatoses including neurodermatitis, atopic dermatitis, eczematous dermatitis, seborrheic dermatitis and certain cases of psoriasis. The 0.1% Cream or Ointment is usually effective in abating symptoms of skin conditions responsive to topical triamcinolone, but the 0.5% Cream may be preferable in more resistant cases. *Dosage:* Apply small quantity to area 3 or 4 times daily. Side effects are rare. *Contraindications:* tuberculosis of the skin, herpes simplex, chickenpox, and vaccinia. Use with care on infected areas. Do not use in the eyes. Supplied in 5 and 15 Gm. tubes and ½ lb. jars. Also available in foam form and with Neomycin.

Aristocort® TOPICAL CREAM 0.1% AND OINTMENT 0.1%

Triamcinolone Acetonide

Visits to County Society Meetings

Among the most gratifying contacts developing in our library program recently have been the visits to several county society meetings. In all instances the members have shown a real interest in the books brought to these meetings and in learning of the services the library can furnish. County societies that wish library representatives to vist should let the librarian or Mr. Sargeant know so that a schedule can be arranged. This applies to requests for special subject material or titles the county members desire also.

BOOK REVIEWS

From time to time we shall feature book reviews in this column, beginning with the following by Frank L. Iber, MD, associate professor of medicine, Johns Hopkins Hospital.

MEDICAL, SURGICAL, AND GYNECOLOGIC COMPLICATIONS OF PREGNANCY, Second Edition. Edited by Joseph J. Rovinsky, MD, and Alan F. Guttmacher, MD. 843 pages. Waverly Press, Inc., Baltimore, 1965

Medical books, like doctors, have become more and more specialized in their material, so that it is rare indeed for a book to be of use and interest to ALL practicing physicians; yet I believe that this is such a book. Pregnancy is increasingly recognized in the presence of many acute and chronic diseases. Few of us, as physicians, are qualified by experience or training to answer the ever-present questions: What does the disease do to the pregnancy, the fetus, or labor? What do the pregnancy and labor do to the disease? What effect does the usual treatment of the disease have on the pregnancy, the fetus, or the conduct of labor?

Textbooks of obstetrics usually emphasize the first of these problems—the effect of the disease on the pregnancy, the fetus, and labor, but do not provide sufficient detail on the other questions. The Obstetrics Department of the Mount Sinai Hospital, in New York City, began some 15 years ago a series of special clinics in 10 areas of major disease to observe the course of pregnancy on varicose veins, heart disease, and other conditions. These clinics were staffed jointly by obstetricians and other specialists in the field of the clinic. From this emerged the first edition of this book, published in 1960, and the present volume.

The current edition consists of 56 chapters organized into 13 major subheadings. Each of the specialty areas contributes a section, thus covering cardiovascular-renal disease, pulmonary disease, gastrointestinal disease, eye, ear, nose, and throat problems, malignancy, neuropsychiatric problems, hematologic problems, endocrine, dermatological, infectious, and collagen diseases. Special detailed sections on some of the gynecologic, surgical, and obstetric complications that influence other diseases in a special way are presented.

Each chapter is written from the point of view of the physician managing the pregnant patient, emphasizing neither the obstetrician's nor the specialist's point of view. It draws upon special information from both fields and relies heavily on the experience of the writer and the literature.

Outer space or out of space?

If you're in the dark on how to improve your office efficiency through better use of existing space, may we offer a suggestion. The Lucas Design Group plans executive office interiors and general office units to provide harmonious, well-organized 9 to 5 operations. They make big ones out of little ones, so to speak. When employee-to-space ratios decrease due to a business increase, it's time to have your secretary make an appointment for you with one of our designers. MUlberry 5-3000.

The information given is that which a psychiatrist, a gastroenterologist, or a surgeon expects himself to have, but from infrequency of encounter is often not immediately available. The present edition has special emphasis on the effect of therapeutic maneuvers on the pregnancy and fetus. Factors leading to the therapeutic termination of the pregnancy are widely discussed, and guidelines offered for all physicians.

The book is a most attractive package. Most chapters are readable and of a length suited for the busy physician. Additional reading is offered for those requiring more information, but most of the needed facts are given. The editors have exercised a heavy hand to maintain uniform conciseness.

Frank L. Iber, MD

Woman's Auxiliary
MARYLAND WAMCF HYGEIA FILIAE

January, 1966

MRS. IRVING J. TAYLOR, *Auxiliary Editor*

Mrs. Howard Weeks

President, Woman's Auxiliary to the Washington County Medical Society

Buckannon, WVa, was the birthplace of Mrs. Weeks and her twin sister. Mrs. Weeks majored in home economics at the University of Maryland and did catering before her marriage. In 1948 the family moved to Hagerstown. There she met Dr. Howard Weeks, who was dating her twin sister. Five years later he decided he preferred the other twin and made her his wife.

Dr. Weeks had, in the meantime, graduated from the University of Maryland School of Medicine and interned at St. Vincent's, Bridgeport, Conn. After three months as a ship's surgeon with the Grace Lines, he began general practice in Hagerstown, where they have made their home.

Because of their hair coloring, the Weeks children liken themselves to three ice cream cones, each a different flavor: 9-year-old Renelle is strawberry, 7-year-old Howard, Jr., is vanilla, and 1-year-old Roxanne is chocolate.

Mrs. Weeks has held numerous offices and chairmanships in the Washington County Auxiliary. She has also served as finance chairman in the state auxiliary. In her community she is active in her church and in the ZONTA International.

Beginning with their honeymoon 10 years ago, Dr. and Mrs. Weeks have traveled extensively both in the United States and abroad. But since Dr. Weeks has become chief of staff at the Washington County Hospital, they will have to curtail their travels somewhat.

Culinary art is a hobby of Mrs. Weeks. She collects cookbooks and names *Gourmet* as her favorite magazine. At the end of a busy day, she often reads herself to sleep with one of these.

Star-spangled money saver

Used properly, this red, white and blue writing "tool" can take care of your money-saving problems in a single stroke.

You just grasp it firmly and put your John Hancock on an application for the Payroll Savings Plan where you work.

This authorizes your employer to make your savings automatic. He sets aside a small amount from your check each payday toward the purchase of U. S. Savings Bonds.

The amount can be any size. The important thing is it's saved regularly.

Don't worry if you have to use an ordinary pen instead of a star-spangled one. You'll get a nice star-spangled feeling to make up for it.

Buy U.S. Savings Bonds

Dietary Violations are Diminished Profoundly with...

†STEDYTABS Delfeta-sed*

•SEDAFAX (brand of special micronized grade of AMOBARBITAL - Warning: may be habit forming.).....**120 mg.**

DELFETAMINE (brand of dl-N-METHYL-amphetamine HCl.).....**30 mg.**

Usual Adult Dosage: One tablet daily. To be taken in the morning.

Tablets Delfeta-sed*

•SEDAFAX (brand of special micronized grade of AMOBARBITAL - Warning: may be habit forming.).....**40 mg.**

DELFETAMINE (brand of dl-N-METHYL-amphetamine HCl.).....**10 mg.**

Usual Adult Dosage: In obesity, 1 tablet t. i. d. 30-60 minutes before meals. In all other conditions, take 1 tablet t. i. d. immediately after meals.

†STEDYTABS DELFETA-SED are so prepared that the active ingredients are released continuously to provide for prolonged therapeutic effects for a period of up to 8 to 10 hours.

The dieting obese sometime experience emotional problems as secondary symptoms resulting from restricted food intake: anxiety, depression, irritability and tension. Subjective relief is accomplished with Delfeta-sed •(Delfetamine, dl-N-Methylamphetamine HCl) balanced with the mild euphoric sedative action of Sedafax, brand of Amobarbital-Warning: may be habit forming). The mood is altered to promote optimism and impart a cheerful sense of energy and well-being.

IN DEPRESSION: A completely logical synergistic combination of wide application as a mood normalizer for the common depressed states encountered in everyday practice. Induces a serene outlook without excessive tranquillity. The patient is alert but composed, free from emotional peaks and troughs. Relieves anxiety which is a part of every illness.

CAUTION:

Contraindicated in the presence of marked hypertension and in cases of coronary or cardiovascular disease; also, in patients hypersensitive to barbiturates or ephedrine-like drugs.

For those who cannot cope realistically with the emotional turmoil and stress of modern living, the physician has at hand many valuable psychotherapeutic aids. One of the most useful is Librium, a pre-eminent prescription for excessive anxiety in this modern age.

ROCHE

LIBRIUM® (chlordiazepoxide HCl)

5 mg 10 mg 25 mg capsules in #50's

In prescribing: Dosage—Adults: Mild to moderate anxiety and tension, 5 or 10 mg t.i.d. or q.i.d.; severe states, 20 or 25 mg t.i.d. or q.i.d. Geriatric patients: 5 mg b.i.d. to q.i.d. **Side Effects:** Side effects, usually dose-related, include drowsiness, ataxia, minor skin rashes, edema, menstrual irregularities, nausea and constipation. When treatment is protracted, blood counts and liver function tests are advisable. Paradoxical reactions may occasionally occur in psychiatric patients. Individual maintenance dosages should be determined. **Precautions:** Advise patients against possibly hazardous procedures until maintenance dosage is established. Though compatible with most drugs, use care in combining with other psychotropics, particularly MAO inhibitors or phenothiazines; warn patients of possible combined effects with alcohol. Observe usual precautions in impaired renal or hepatic function, in long-term treatment and in presence of depression or suicidal tendencies. Exercise caution in administering drug to addiction-prone patients or those who might increase dosage; withdrawal symptoms, similar to those seen with barbiturates or meprobamate, can occur upon abrupt cessation after prolonged overdosage. Caution should be exercised in prescribing any therapeutic agent for pregnant patients. **Supplied:** Capsules, 5 mg, 10 mg and 25 mg, bottles of 50.

Brewer Diagnostic Kits

Complete Serological Screening Tests For Syphilis . . .

The RPR Card Tests make use of a specially prepared, carbon-containing RPR Card antigen. The particle size and other characteristics of the carbon is such that when a reactive specimen is encountered, flocculation occurs, and there is a coagglutination which is readily visible to the naked eye. Individual tests, including the collection of blood and separation of plasma can be performed in 7 to 8 minutes.

Confirming earlier findings with the RPR Card Test[1-10] Reed[11] in reporting on 63,800 specimens had an overall agreement of 98.5% in a recent comparative study with other routine screening procedures.

The RPR Card Tests, with their low cost, ease of performance, high sensitivity and specificity, are without peer in situations that demand rapid testing of patients, enabling the physician to initiate prompt treatment of early infectious syphilis.

Specify the RPR Card Test as the screening procedure on serum or plasma samples submitted to your State Approved Laboratory.

RPR CARD TESTS

FOR SYPHILIS AND OTHER TREPONEMATOSES

HYNSON, WESTCOTT & DUNNING, INC.

Baltimore, Maryland 21201 HW&D

Neo-Synephrine is a standard among topical vasoconstrictors. It is unsurpassed for reducing nasal turgescence in colds; and a most valuable aid in preventing and treating sinusitis.

Neo-Synephrine stops the boggy feeling of colds at once—works against factors that induce sinusitis. With Neo-Synephrine nose drops, spray or jelly, turbinates shrink on contact, obstructed ostia open and drainage is re-established.

In sinusitis, Neo-Synephrine helps to promote drainage and hasten recovery.* Used promptly, it helps clear the stagnant sinus and lessen the chances of chronicity.

Neo-Synephrine HCl is available in:
⅛% solution for infants
¼% solution for children and adults
¼% pediatric nasal spray for children
½% solution for adults
½% nasal spray for adults
½% jelly for children and adults
1% solution for adults (resistant cases)

An antibiotic of choice is one that works

TAO works

Susceptibility Results
Staphylococci [2,3,1]

# OF CULTURES	YEAR	% EFFECTIVE
6,725	1962	88.6%
5,440	1963	88.0%
10,384	1964	88.5%

β-Hemolytic Streptococci [2,3,1]

2,448	1962	89.5%
1,519	1963	95.2%
2,492	1964	96.7%

The Product

In a world study of antibiotics *in vitro*[1], TAO had an overall effectiveness of 87.3%, higher than chloramphenicol and erythromycin, and significantly higher than tetracycline and penicillin.

The Plus... Consistent Performance

Yet antibiotics must not only work. They must work consistently. Here are the results from the largest study of microbial susceptibility ever undertaken. In 29,048 cultures of overt staphylococcal and β-hemolytic streptococcal infections, note the consistency of results with TAO.

TAO®
[triacetyloleandomycin]

J. B. Roerig and Company, New York, New York 10017
Division, Chas. Pfizer & Co., Inc., Science for the World's Well-Being®

TAO Rx information

Indications: The bacterial spectrum includes: streptococci, staphylocci, pneumococci and gonococci. Recommended for acute, severe infections where adequate sensitivity testing has demonstrated susceptibility to this antibiotic and resistance to less toxic agents. **Contraindications and Precautions:** TAO (triacetyloleandomycin) is not recommended for prophylaxis or in the treatment of infectious processes which may require more than ten days continuous therapy. In view of the possible hepatotoxicity of this drug when therapy beyond ten days proves necessary, other less toxic agents, of course, should be used. If clinical judgement dictates continuation of therapy for longer periods, serial monitoring of liver profile is recommended, and the drug should be discontinued at the first evidence of any form of liver abnormality. It is contraindicated in pre-existing liver disease or dysfunction, and in individuals who have shown hypersensitivity to the drug. Although reactions of an allergic nature are infrequent and seldom severe, those of the anaphylactoid type have occurred on rare occasions. **References:** 1. Inquire: Edward C. Rosenow, Jr., MD, executive director, The American College of Physicians, 4200 Pine St., Philadelphia, Pa. 19104.

Architect: Edward H. Noakes & Associates, A. I. A.

Here is a superb setting for the medical man who knows the importance of environment for his office location. In the heart of suburban Bethesda's medical research complex, Georgetown Doctor's Park features office suites of approximately 600, 900, 1200, and 1500 square feet specifically designed for doctors or dentists. Patients may park just steps from your ground level entrance.

- Immediate occupancy
- Sound conditioning
- Charmingly designed colonial facades
- Individually controlled air conditioning and heating
- Tree-studded setting
- Private entrance to each suite
- Directly across from the National Institute of Health and two minutes from Suburban Hospital
- Less than one mile from Beltway

DIRECTIONS: North on Wisconsin Avenue, left on Cedar Lane, OR, take Capital Beltway to Exit 19 (Wisconsin Avenue), South on Wisconsin Avenue, right on Cedar Lane.

GEORGETOWN DOCTOR'S PARK • 5401 WEST CEDAR LANE • BETHESDA, MARYLAND

Patients won't complain about bitter penicillin taste when you specify V-Cillin K. Here's why: It has a special coating, only one and a half *thousandths* of an inch thick. Because it is designed to dissolve after approximately six seconds, this barrier to bitterness remains on the tablet as it slides past the tongue. When the tablet reaches the stomach, however, the coating has dissolved, and the penicillin is ready for immediate absorption into the bloodstream.
Result? The proved efficacy of potassium penicillin V without the penalty of bitter taste.

Indications: V-Cillin K is an antibiotic useful in the treatment of streptococcus, pneumococcus, and gonococcus infections and infections caused by sensitive strains of staphylococci.

Contraindications and Precautions: Although sensitivity reactions are much less common after oral than after parenteral administration, V-Cillin K should not be administered to patients with a history of allergy to penicillin. As with any antibiotic, observation for overgrowth of nonsusceptible organisms during treatment is important.

Usual Dosage Range: 125 mg. (200,000 units) three times a day to 250 mg. every four hours.

Supplied: Tablets V-Cillin K, 125 or 250 mg., and V-Cillin K, Pediatric, 125 mg. per 5-cc. teaspoonful, in 40, 80, and 150-cc.-size packages.

Lilly

V-Cillin K®

Editorial

MORE ABOUT THE EDUCATED HAND

SAMUEL MORRISON, MD
Past President, Baltimore City Medical Society

A recent editorial (October, 1965) considered the educated hand as a diagnostic instrument. The gratifying response to this editorial leads me to comment further on the educated hand.

To the gynecologist, the educated hand is his most important examining tool. Dr. Imre Neubauer told me that in one of the European hospitals devoted to gynecology there is a picture of the gynecologist's hand, and on one of the fingers is an eye, indicating that with his hand he sees.

The hand is also an instrument for treatment. Consider the dextrous and skillful hands of the surgeon or the even more delicate hands of the ophthalmologist when he performs his fine operations.

It is a wonder of the Creator that these remarkable hands, so often taken for granted except when they are lost or injured, can perform such diverse functions. The alert, running fingers of the skilled typist are impressive to behold, as are the deft hands of the pianist. The tender and expressive hands of the ballet dancer are unequaled in beauty. The reading hands of the blind are amazing evidence of the ability of the hand to see and interpret. The hypnotic hands of the magician seem to defy the impossible.

We have seen people who have lost their hands or had them maimed, and we marvel at the mechanical attempts to replace them. Yet though they approximate the human hand, they can never equal the original.

In medicine, the sensitivity of the physician's hand can be impaired. This might happen when he presses too hard, not only pushing away the object which he is trying to examine but also compressing his own fingertips or hands, diminishing the blood supply, and rendering the examining hand less sensitive, less able to react reflexly, and less able to interpret.

It seems to me that the proper use of the hand reaches a peak in our profession. In the overall picture it should not be compared to the eyes or the ears, which have other remarkable properties, but it can be compared to a God-given instrument with all the complex abilities of a human being. Without question, the educated hand is among the most valuable of our tools for both diagnosis and treatment.

11 East Chase Street
Baltimore, Md. 21202

when treatment might precipitate a problem with monilia

especially in elderly or debilitated patients

and in diabetics — patients with a history of fungal overgrowth — patients on steroids who require antibiotics. The antimonilial specificity of Nystatin plus the extra benefits of DECLOMYCIN Demethylchlortetracycline allow lower mg intake per dose per day, the option of b.i.d. dosage, higher activity levels, 1-2 days' "extra" activity.

Side Effects typical of tetracyclines include glossitis, stomatitis, proctitis, nausea, diarrhea, vaginitis, dermatitis, overgrowth of nonsusceptible organisms, tooth discoloration (if given during tooth formation) and increased intracranial pressure (in young infants). Also, very rarely, anaphylactoid reaction. Reduce dosage in impaired renal function. Because of reactions to artificial or natural sunlight (even from short exposure and at low dosage), patient should be warned to avoid direct exposure. Stop drug immediately at the first sign of adverse reaction. It should not be taken with high calcium drugs or food; and should not be taken less than one hour before, or two hours after meals.

Average Adult Daily Dosage: four divided doses of 1 capsule each or two divided doses of 2 capsules.

Your MEDICAL FACULTY at Work

JOHN SARGEANT — EXECUTIVE SECRETARY

EXECUTIVE COMMITTEE, DECEMBER 9

1. One staff member was authorized to attend the meetings of the Professional Conventional Management Association and the Medical Exhibitors Association January 3-5, 1966.

2. Authorization was given for the annual staff Christmas party.

3. Authorization was given to close the Faculty building on December 24 and December 31.

4. Plans are nearly complete for the formation of a group concerned with area-wide health facilities planning. Since funds may be requested from all participating groups, this item was referred to the Treasurer to consider when compiling the 1966 budget.

5. J. Roy Guyther, MD, and William Pillsbury, MD, were designated Faculty representatives to an AMA Conference on federal-state programs for children and the medical aspects of the war on poverty (Title XIX of PL 89-97).

6. Various aspects of the new governmental programs were discussed with representatives of the State Health Department:

A. Former MAA patients will continue under Title XIX, as they were under the Kerr-Mills formula, for the fiscal 1967 budget. Consideration is being given to a switch in the fiscal 1968 budget so that the State Health Department may purchase the $3 a month supplemental program if it is deemed possible. This means that the present program for MAA patients will continue as is.

B. The question of reasonable or customary fees for medical care programs is currently under study in the Health Department, and further data will be available. The 1967 budget does not include funds for payment of such fees. It is hoped that this can be included in the 1968 budget.

C. No data have been received from HEW in connection with Utilization Committee activities, and no specific programs or activities in this area are contemplated at present.

D. The Health Department still has under consideration publication of a list of rules and regulations with which physicians must comply. It is hoped this will be available for distribution to physicians in the near future.

E. The question of volume drug discounts is under study in the Council on Medical Care. This would provide volume discounts in the form of a rebate to the state government on medical care prescriptions filled at the retail rate allowed under the medical care programs. Statistical sampling would provide the basis for making the discounts, and the discount would be based on the total amount of sales made to the State of

Maryland, including the individual Rx items.

F. A request is being processed for a planning grant under PL 89-239, the bill for regional programs of heart disease, cancer, and stroke. If a grant is approved, the medical society will be consulted and represented on the advisory committee to this program.

7. A request from Aetna Insurance Company to be designated by the Faculty as a candidate for fiscal administrator of the Medicare program could not be acted upon because it is a matter for Council action and the Council would not meet again until after the deadline for submitting suggested candidates.

8. Maryland Medical Service, Inc., presented the idea of a prevailing fee concept. The Executive Committee urges all physicians to cooperate with Blue Shield in a survey designed to establish guides for preparing a prevailing fee program.

9. Edmund G. Beacham, MD, was approved as the Faculty's candidate to receive the Governor's award for employment of the physically handicapped.

10. The question of statewide or regional sessions to educate physicians and their staff on PL 89-97 (Medicare) was referred to the Policy and Planning Committee.

11. Approval was given to co-sponsoring a conference on traffic safety with the Maryland Chapter, American College of Surgeons.

12. Because of a conflict with Faculty policy, the Executive Committee could not endorse the Provident Hospital's fund campaign. This must be left to the individual physician to decide.

13. An informal presentation was made of the survey on "Patterns of Medical Care." This project will be cleared through the Policy and Planning Committee and recommendation made to the Council.

DEPROL®

meprobamate 400 mg. + benactyzine hydrochloride 1 mg.

Indications: 'Deprol' is useful in the management of depression, both acute (reactive) and chronic. It is particularly useful in the less severe depressions and where the depression is accompanied by anxiety, insomnia, agitation, or rumination. It is also useful for management of depression and associated anxiety accompanying or related to organic illnesses.

Contraindications: Benactyzine hydrochloride is contraindicated in glaucoma. Previous allergic or idiosyncratic reactions to meprobamate contraindicate subsequent use.

Precautions: *Meprobamate*—Careful supervision of dose and amounts prescribed is advised. Consider possibility of dependence, particularly in patients with history of drug or alcohol addiction; withdraw gradually after use for weeks or months at excessive dosage. Abrupt withdrawal may precipitate recurrence of preexisting symptoms, or withdrawal reactions including, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, the dose should be reduced and operation of motor vehicles or machinery or other activity requiring alertness should be avoided if these symptoms are present. Effects of excessive alcohol may possibly be increased by meprobamate. Grand mal seizures may be precipitated in persons suffering from both grand and petit mal. Prescribe cautiously and in small quantities to patients with suicidal tendencies.

Side effects: Side effects associated with recommended doses of 'Deprol' have been infrequent and usually easily controlled. These have included drowsiness and occasional dizziness, headache, infrequent skin rash, dryness of mouth, gastrointestinal symptoms, paresthesias, rare instances of syncope, and one case each of severe nervousness, loss of power of concentration, and withdrawal reaction (status epilepticus) after sudden discontinuation of excessive dosage.

Benactyzine hydrochloride—Benactyzine hydrochloride, particularly in high dosage, may produce dizziness, thought-blocking, a sense of depersonalization, aggravation of anxiety or disturbance of sleep patterns, and a subjective feeling of muscle relaxation, as well as anticholinergic effects such as blurred vision, dryness of mouth, or failure of visual accommodation. Other reported side effects have included gastric distress, allergic response, ataxia, and euphoria.

Meprobamate—Drowsiness may occur and, rarely, ataxia, usually controlled by decreasing the dose. Allergic or idiosyncratic reactions are rare, generally developing after one to four doses. Mild reactions are characterized by an urticarial or erythematous, maculopapular rash. Acute nonthrombocytopenic purpura with peripheral edema and fever, transient leukopenia, and a single case of fatal bullous dermatitis after administration of meprobamate and prednisolone have been reported. More severe and very rare cases of hypersensitivity may produce fever, chills, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, anaphylaxis, stomatitis and proctitis. Treatment should be symptomatic in such cases, and the drug should not be reinstituted. Isolated cases of agranulocytosis, thrombocytopenic purpura, and a single fatal instance of aplastic anemia have been reported, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity has been reported, usually after excessive meprobamate dosage. Suicidal attempts may produce lethargy, stupor, ataxia, coma, shock, vasomotor and respiratory collapse.

Dosage: Usual starting dose, one tablet three or four times daily. May be increased gradually to six tablets daily and gradually reduced to maintenance levels upon establishment of relief. Doses above six tablets daily are not recommended even though higher doses have been used by some clinicians to control depression and in chronic psychotic patients.

Supplied: Light-pink, scored tablets, each containing meprobamate 400 mg. and benactyzine hydrochloride 1 mg.

Before prescribing, consult package circular.

EXECUTIVE SECRETARY'S NEWSLETTER

February, 1966

REFERENCE COMMITTEE MEETING SET

The Reference Committee meeting date has been set for

THURSDAY, MARCH 31, at 8:00 p.m.

at the Faculty Building. As of this writing, no resolutions have been received for consideration at this time.

Resolutions must be received in the Faculty Office by Tuesday, March 1, in order to be considered at the Annual Meeting, April 27.

CRUISE RESERVATIONS

March 1 has also been established as the date when reservatious for the Annual Meeting Cruise will be opened to other interested groups, rather than the Faculty.

Reservations should be addressed to:

Travel Guide Agency
416 North Charles Street
Baltimore, Maryland 21201
Telephone: 727-0682 or 727-1696

Miss Natalie Kuff is handling all arrangements in this area, on behalf of the Faculty.

NEWS NOTES

Gilbert D. Barkin, M.D., Silver Spring, has been named Secretary of the Southern Medical Association Section on Allergy.

Victor A. McKusick, M.D., Chief, Division of Medical Genetics and Professor of Medicine, Johns Hopkins University School of Medicine; and James Shannon, M.D., Director, NIH, Bethesda, have been granted Modern Medicine Distinguished Achievement Awards.

R. Donald Eney, M.D., and Eugene Goldstein, M.D., both of Baltimore, were certified by the Subspecialty Board in Pediatric Allergy, after passing examinations given last October.

Jacob H. Conn, M.D., Assistant Professor of Psychiatry at Johns Hopkins was honored at a testimonial dinner given on the occasion of his

62nd birthday, as well as 35 years in psychiatry and 25 years in medical hypnosis. The dinner was sponsored by the Society for Clinical and Experimental Hypnosis.

William O. Harrison, University of Maryland School of Medicine; and James L. Boyer, Philip O. Littleford, Robert M. Marshall and Bradley M. Rodgers, all of Johns Hopkins School of Medicine; are participants in the Smith, Kline and French Foreign Fellowships program. The program provides for medical students to assist physicians working in foreign fields and developing nations treat their sick people.

Frank J. Ayd, Jr., M.D., is editor and publisher of a newly established Newsletter, International Drug Therapy Newsletter.

NEW DRUG RULES

Several questions have been raised with respect to physician accounting for drug samples when they fall within the area of amphetamines and/or barbiturates.

Information is that:

1. Physicians who dispense drugs for which they charge the patient must maintain records of samples received in the mail or from the detail men.

2. Physicians who do not dispense will not have to keep records of samples received, used, or dispensed in the course of their practice.

Manufacturers, distributors and their representatives must keep records of samples given to physicians. See page 20 for further details.

MEDICAL EDUCATIONAL DEDICATED INSTRUCTION CHANNEL

Regular educational programs now in the fifth month of operation are attracting many listeners. University of Maryland Medical School has been added to the circuit.

Information on forthcoming programs and speakers can be found on page 7.

PL 89-74 Now in Effect:

What Records Must Physicians Keep?

PL 89-74, which took effect February 1, establishes special controls over the manufacture and distribution of depressant and stimulant drugs. Among these controls is the keeping of records of the manufacture, sale, delivery, and receipt of such drugs.

To clarify the new law as it applies to physicians and the records they must keep, PL 89-74 clearly says that *physicians are not required to keep records as a consequence of this law unless, in the course of their practice, they dispense the drugs referred to and charge for them.* That portion of the act reads as follows:

> The provisions of paragraphs (1, Records) and (2, Inspection) of this subsection shall not apply to a licensed practitioner . . . with respect to any depressant or stimulant drug received, prepared, processed, administered, or dispensed by him in the course of his professional practice, unless such practitioner regularly engaged in dispensing any such drug or drugs to his patients for which they are charged, either separately or together with charges for other professional services.

The key phrases in this paragraph are the words *regularly engaged* and *for which they are charged.*

Further in this regard is a quote from the House Report of the Committee on Interstate and Foreign Commerce on HR 2, which became PL 89-74:

> The committee intends . . . to require record-keeping and to permit inspection in the case of those physicians who maintain a supply of pharmaceuticals or medicinals in their offices from which they compound prescriptions for their patients for a fee.

The language of the Senate Committee Report is identical. Both committee reports stated that those required to keep records "involve only a very small percentage of physicians."

The proposed regulations underscore this point, indicating that ". . . maintaining of small supplies of these drugs for dispensing or administering in the course of professional practice in emergency or special situations will not be considered as regularly engaged in dispensing for a fee."

For those physicians who, in the course of their practice, *regularly dispense drugs and charge for them,* certain records are required to be kept for three years, effective February 1, 1966. Included are: a complete, accurate record of all depressant and stimulant drugs on hand February 1, 1966; a complete, accurate record of the kind and quantity of each drug received, sold, delivered or otherwise disposed of; the name, address (and registration number under Section 510 ((e)) of FDCA) of the person from whom the drugs were received, and to whom they were sold, delivered, dispensed or otherwise disposed of; and the date of the transaction. No separate form for these records will be required as long as the information specified is available.

Gout is a chronic disease with a high familial incidence. The pathogenesis of hyperuricemia in patients with gout is still undetermined. Probenecid and colchicine have been effectively used for many years in moderate and severe cases of gout. A recently introduced anti-gout drug, a xanthine oxidase inhibitor, appears to have merit in resistant cases.

Selected Aspects of GOUT AND GOUTY ARTHRITIS

JOHN H. TALBOTT, MD, Editor
Journal of the American Medical Association

Gout is one of the diseases most gratifying to treat, and I am sure there must be one or two members of this group afflicted with the malady. Usually they are aware of it; sometimes not. It is a disease we see in physicians, among other groups of the social order.

We are dealing with a chronic disease, a disease once the diagnosis is made or once the clinical manifestations have appeared will be with the patient so long as he is with us. This means, then, that continuous attention must be paid to medication. It is not a disease that once the diagnosis is made, at least in most patients, it can be forgotten. When it is forgotten, then the patient sooner or later is a candidate for more and more trouble.

The malady has a higher family incidence than we are taught to expect. The longer we follow the patients, the higher the familial incidence in our experience. Gout may skip a generation, but the concentration of uric acid may be elevated into the gouty range in non-affected relatives. The several series that have been reported over a period of time reveal a familial incidence as high as 20% in the elevation of uric acid unrelated to acute attacks, or possibly, I should say, before the acute attacks.

It is proper to inquire in a long-range study, what is the chance of a non-affected relative becoming a patient at some future time? In our experience, which extends over more than two decades, the number of non-affected relatives, either male or female, who showed an increased concentration of uric acid without the development of acute articular symptoms is so low that it probably may be ignored except by the subject himself, who should be aware of the increased concentration. And at some future time, which may be 10, 20, 30, or more years, he may have an "unexplained attack of acute arthritis" unless he recalls this finding.

The changes in the serum uric concentration of a son of a patient with gout over a 12-year period are shown in fig. 1. We saw the son first when he was 10 years of age. The concentration of serum uric acid was quite within the normal range—3.8mg/100ml. The son came to see us

Presented at the annual meeting of the Medical and Chirurgical Faculty of Maryland, April 23, 1965, in Baltimore.

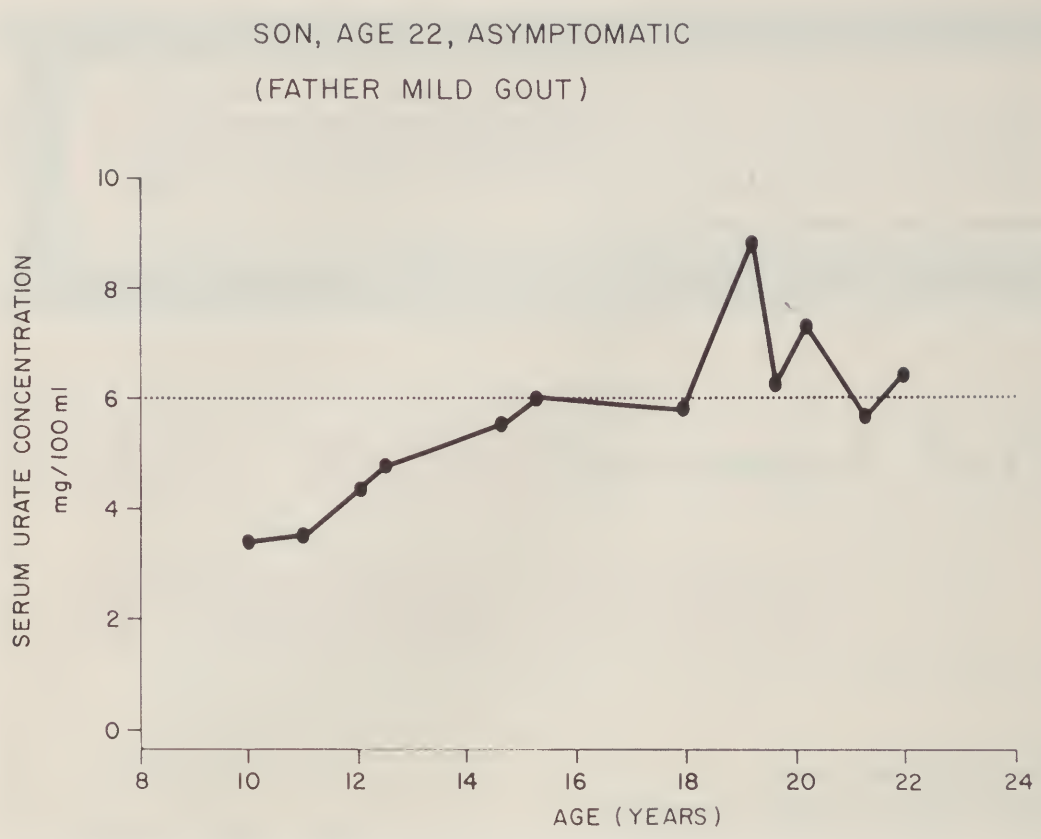

Fig. 1

from time to time according to a mutual understanding. Six years later, we noticed his serum urate had proceeded from the mid normal range to the upper limits of normal, 6mg/100 ml. As we followed him in the subsequent two or three years, he moved into the well developed gouty range, again without any symptoms of an acute attack of gouty arthritis.

We have two or three other examples in which there is good evidence that the increased concentration of uric acid in nonaffected relatives occurs during adolescence. Furthermore, we have examined a number of children below the age of 10 or 12 of gouty parents with normal concentrations and a number of non-affected relatives in the early 20's who show an elevated concentration.

The pathogenesis of the increased concentration of uric acid in the serum is still undetermined. There are three obvious reasons why there might be an increased concentration: a) too much being made by the body; b) too little being excreted by the kidneys; and c) too little being destroyed in the intermediary metabolism of the degradation product.

Some highly competent and devoted investigators believe there may be more than one type of clinical familial gout. This poses an interesting problem insofar as the pathogenesis of a disease generally. I am not one who believes there may be several disturbances in either the metabolism or the physiology of uric acid responsible for different types of disease. We see a great variety of clinical manifestations; those who have it in a very mild degree, who may have one attack every 10 years, or who may have one or two attacks in a lifetime, to those who constitute a relatively small percentage of the total who have severe chronic tophaceous gout. However, I believe it is all one disease, with varying impact on the patient.

We possess somewhat more evidence regarding the pathogenesis of the acute attacks. There is strong presumptive evidence that an acute attack of gout does not occur without the presence of uric acid crystals in the joint. On the other hand,

we see patients with extensive tophaceous deposits in the joints without any history of having experienced acute symptoms in the joint under consideration.

Why do the symptoms appear rapidly? We know that sometimes there are acute precipitating agents; parenteral injection of penicillin may be followed within a day or so by an acute attack of gouty arthritis in the susceptible person who is not protected by prophylactic medication. It has been recognized for several decades that gout may appear two or three days after a surgical procedure in patients not protected with prophylactic medication. Emotional trauma may be implicated as a precipitating factor. But we know also or have strong presumptive evidence that the uric acid has been present in the joint for a long, long time.

But why, when it has been deposited in a joint for so long, do such extraneous factors or factors that apparently are unrelated to acute articular distress cause the acute attack? We have a 20-year follow-up on such a patient. We had good evidence that neither knee gave the patient any trouble from attacks of acute arthritis. The first 10 years he was not protected with gout drugs, while during the recent 10 years, he was protected with colchicine. Other joints besides his knee were involved. In such a patient, without the administration of prophylactic medication, why does something happen at some time in which an acute arthritis develops while the urate deposits have been present for a long, long time?

The most reliable criterion in diagnosis is the evidence related to the clinical description. If I had one criterion only upon which to make a diagnosis, it would be the clinical characteristics of the acute attack. The incidence ratio remains 20 to 1, male over female. The age is also of some help. It is unusual to observe acute arthritis developing for the first time in the teens, although a few examples have been reported. At the other end of the scale, gouty arthritis may develop for the first time in the seventh or eighth decade. In most instances, it appears in the middle decades of life. The clinical characteristics are more helpful in diagnosis than the concentration of serum uric acid.

The second most helpful criterion is the response to colchicine. While a number of drugs are useful in the treatment of this disease, colchicine is the only specific drug. Except for two unusual manifestations of articular disturbance—sarcoidosis and a peculiar form of intra-articular calcinosis—colchicine is specific for an acute attack of gouty arthritis when administered in the accepted fashion; namely, regular administration, hourly or two-hourly intervals until the onset of gastrointestinal distress.

The other anti-articular agents—phenylbutazone, the steroids, ACTH, even aspirin may be of value in the treatment of many types of acute joint distress, but colchicine is the only specific drug for acute articular gout.

Determination of uric acid in the serum poses no problem in a laboratory deeply devoted to the study of this problem, where great reliance in a series of patients suffering from all types of joint disease are under study; but in the routine chemical laboratory, the serum uric acid determination is still one of the more difficult tests to perform and therefore is more susceptible to false interpretation. The average patient with gout, irrespective of the presence of acute or chronic symptoms, except for the administration of uricosuric agents, will show an elevation above 6mg/100ml.

On the other hand, many times when a patient consults the physician for the first time or consults the physician without a diagnosis of gout having been made previously, having had acute articular symptoms, may have well relied upon an aspirin-containing pain-reliever from the medicine cabinet, which drug tends to depress the concentration of uric acid. Thus, the result reported may have been unreliable if the datum is sought for diagnostic purposes.

If the uric acid is greater than 10 or 11mg/100ml, one must suspect a form of gout other than acute familial gout, such as a blood dyscrasia, particularly in a young person. Several drugs are known to cause an increased concentration of uric acid. The thiazide diuretics are the most common. Sometimes it is futile to speculate whether a patient on a thiazide is experiencing the first attack in an unrecognized family history or whether this is idiopathic gout related specifically to the administration of the diuretic. Treatment is the same irrespective of whether it is familial gout or gout associated with blood dyscrasia, or iatrogenic gout associated with the administration of a new drug.

When a patient is seen during the first attack,

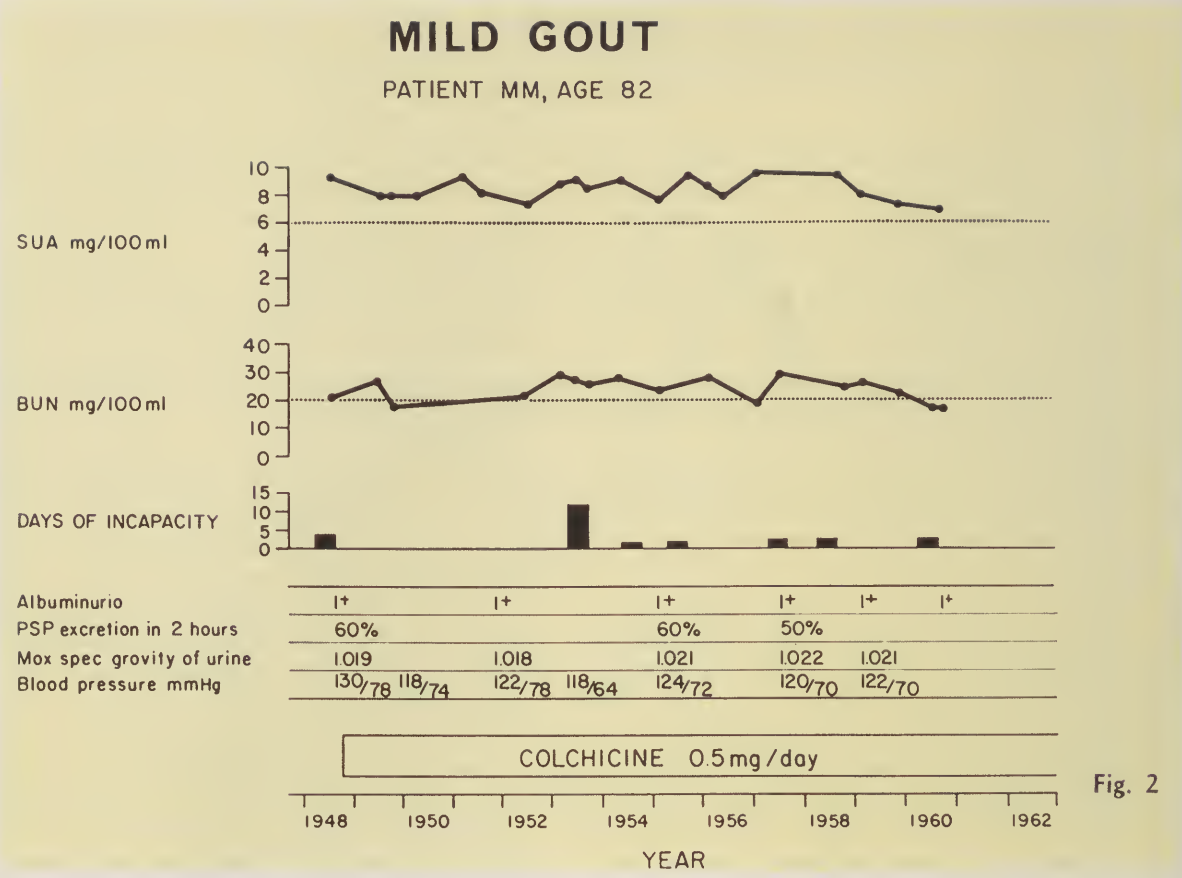

Fig. 2

it is helpful to have an x-ray, but we should not expect it to be positive. It should be procured for its documentary value or possibly to point to some other disturbance masquerading as acute gouty arthritis.

A positive family history is helpful in diagnosis. The presence of urinary findings and elevated blood pressure may be of some assistance. Approximately 40% of the patients with clinical familial gout will have intermittent or sometimes persistent unexplained albuminuria until a diagnosis of gout is suspected. A similar incidence holds for an elevation of blood pressure.

Renal disease is the only serious complication in our gouty series. Less than 15% of the patients with gout will die prematurely because of acute renal failure. With the availability of adequate drugs for use during the prophylactic period, this percentage should decrease decade by decade.

In a series of more than 200 postmortem protocols there were few kidneys, irrespective of the clinical severity of gouty arthritis, that were passed as normal. Most of the kidneys in this series of cases showed uric acid deposits of varying sizes. There were two other complications observed postmortem that were not regularly recognized clinically, ie, infection in the kidney and small vessel changes.

Figure 2 shows findings from a patient who was seen in his late 60's and was 82 at his follow-up, two years ago. Throughout the period of observation the blood urea nitrogen was either in the upper limit of normal, assuming 20mg/100 ml to be the upper limit of normal, or slightly above in one or two instances. If we saw such a patient who was not suffering from gout, who came to us suspected of suffering from other malady, with a persistent albuminuria and a blood urea nitrogen in this range, we would be concerned and deeply so in view of a poor ultimate prognosis. This patient, however, continues to do well. He has received only 1 mg of colchicine per day. You will recall that he is suffering from mild gout only, and this is a proper prophylactic dose for a patient with mild gout. When he was seen first in 1949, probenecid or other effective

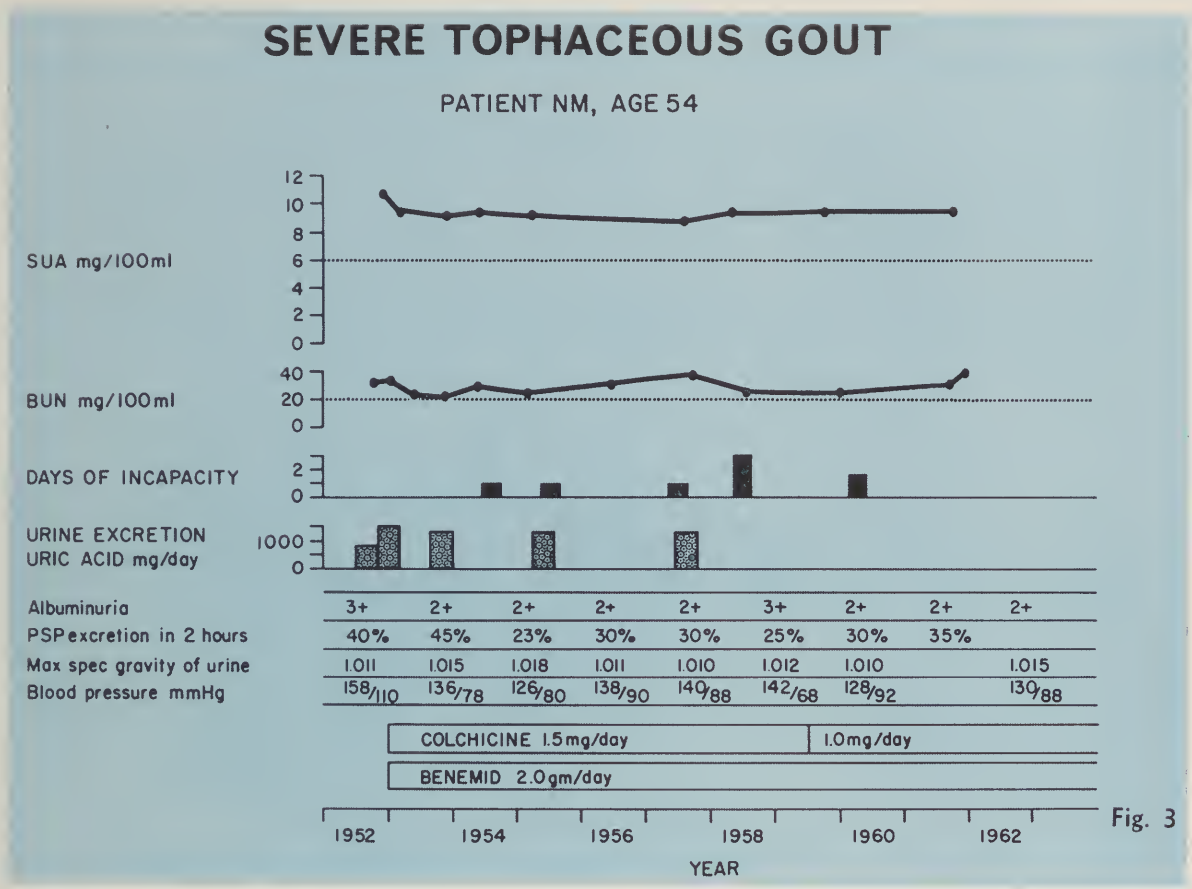

Fig. 3

uricosuric agents were yet to be discovered. During the 15-year period he has averaged not more than two days per year of incapacity. The blood urea nitrogen, a transient albuminuria, and some decrease in PSP excretion should give us some concern if the diagnosis were not gout. The maximum specific gravity of his urine on several occasions has been in the normal range with no elevation of his blood pressure.

Figure 3 shows our findings from a patient who presents a more serious problem. He suffered from severe tophaceous gout when seen in his middle 40's. His tophi had not increased in size during this 10-year-period, but his blood urea nitrogen has been as high as 40mg/100ml. It was never recorded below 20mg, which presents a greater prognostic problem. Albuminuria was 2 to 3 plus and persistent, while the PSP excretion was depressed. The specific gravity was fixed at most examinations. A light elevation of blood pressure gave no concern. Because of severe tophaceous gout, he was given four tablets of probenecid (2Gm) and three tablets of colchicine (1.5mg) a day and has taken this quantity during the 12-year period. He continues to do well, having no more than one attack every second or third year.

The patient whose data are shown in fig. 4 died after he had been observed for a short period of time. He represents quite a different clinical picture. He suffered from severe tophaceous gout at a relatively young age. His serum uric acid was mildly responsive to probenecid. His blood urea nitrogen was in the 40-50mg/100ml range. He experienced little incapacity from his gout because of the daily administration of probenecid and colchicine. Before our observations he had suffered greatly and had been forced to stay home, some years for several weeks. He had an albuminuria of 1 to 2 plus. His PSP excretion was essentially zero. The maximum specific gravity of the urine was less than 1.012. The blood pressure was normal. He died in renal insufficiency.

Figure 5 represents a relative of a gouty patient. His father, with mild gout, died of coro-

nary disease in his mid 70's. We examined all the children and several grandchildren. In one son albuminuria was discovered during a life insurance examination at the age of 18. The blood urea nitrogen was within the normal range and has remained so. His serum uric acid was in the low gouty range and his urinary specific gravity was 1020, but he showed a persistent albuminuria. There wasn't a single examination of his urine that didn't show albumin.

When a patient has a positive family history, a persistent albuminuria, and a persistent hyperuricemia, one might raise the question whether or not to place him prophylactically on antigout agents. I am sure there are those who sincerely believe we do the patient a disfavor by withholding medication. I chose, instead, to continue observing this patient, since medication could be started at any time. We now have a 15-year follow-up on the son, and he hasn't, by our laboratory studies, shown any evidence of progression. Nor has he experienced an acute attack of gouty arthritis.

The question has been raised us to whether or not coronary disease has a higher incidence in patients with gout than in non-gouty males. I am of the opinion that this is not valid. If we are dealing with a group of men in the 50's and 60's, we expect to find an occasional subject develop coronary disease and die of myocardial infarction. One bit of evidence from the Framingham Study appears to show a higher incidence of coronary sclerosis and generalized vascular disease in association with hyperuricemia.

Most important in treatment is the prevention of the recurrences of acute attacks. If we have a satisfactory prophylactic regimen for our patients, irrespective of mild, moderate, or severe gout, we should worry little or not at all about the return of acute attacks, providing the patient remains on daily medication.

Because we are dealing with a dual problem, articular distress and an essentially unrelated problem of uric acid metabolism, we are fortunate in having several agents that are of value both in the uric acid phase and in the treatment of

the acute articular attacks. The adequate prophylactic regimen includes drugs to prevent the recurrence of articular distress and agents that are aimed to lower the uric acid content of the blood.

Figure 6 shows observations on a patient who was followed for 25 years in our clinic. While he was in the service, in 1941, no diagnosis was made of his acute articular distress. In 1947, his serum uric acid was approximately 9mg/100ml. At that time he was placed on two tablets of colchicine a day. He had enjoyed a satisfactory response to colchicine without recurrences, but during this period essentially no change in his uric acid concentration was registered until probenecid, 2 Gm daily, was added. Throughout most of the subsequent period, his uric acid has been less than 6mg/100ml, a satisfactory response to the uricosuric agent. There have been a few mild attacks of arthritis but no time lost from work over a 16 year period.

In contrast, fig. 7 illustrates experimental data of an irascible patient insofar as his gout was concerned. He suffered from moderate gout with minimal changes shown on x-ray of the feet. His recorded past history began in 1943; he was seen first by us in 1949. He reported one or two weeks of incapacity during this interval. When he was seen first he was placed on colchicine, but he was not cooperative and took his medicine irregularly. His prescription for colchicine and probenecid was not refilled as often as recommended. This was matched by a fair response only to prevention of recurrences.

He was placed on probenecid in 1951 and experienced a good response as far as the serum uric acid was concerned when taking the drug, which was only irregularly. The serum uric acid fluctuated considerably, while the drugs were stopped on two occasions. There was little or no clinical benefit during the 10-year period, as measured by days of incapacity, attributable directly to his irregular medication. If a patient is placed on prophylactic medication, he must be as conscientious as if he were diabetic with an oral or parenteral preparation.

Figure 8 shows data from a patient with moderate gout with a positive family history. We first saw him in 1954 and have his record from his family doctor since 1948. At this time he had roentgenographic evidence of tophi, and the blood pressure was at the upper limit of normal. He was placed on probenecid and colchicine with essentially no incapacity for 10 years. He underwent a plastic repair of his iliac arteries in 1961 and did very well, suffering no postoperative gout. He is living a normal life, doing what he wants to do in every respect, but he is careful as far as daily ingestion of his colchicine and probenecid.

Colchicine remains our most helpful drug in the treatment of the acute articular distress for most patients. If a patient is seen within the first 24 or 36 hours after the onset of symptoms, and 1 mg or two tablets are taken every two hours —the equivalent of one tablet each hour—until the onset of gastrointestinal distress, an excellent response may be anticipated. This usually requires 10 or 12 tablets, sometimes 14 or 16.

Another anti-gout agent available during the last decade may be prescribed in doses of 400 to 800 mgm for one or two days. One need not worry about complications or side effects at this dose level for this period of time. This drug has the additional advantage of not being associated with gastrointestinal disturbance as colchicine is. However, one of the principle advantages of colchicine is that if a patient is on daily medication he has a head start on aborting an acute attack.

More recently, a new drug has become available. Allopurinol has been used extensively in England and experimentally in this country. The drug is a xanthine oxidase inhibitor which works at a totally different position in the uric acid cycle. While probenecid increases the excretion of uric acid by inhibiting the reabsorption of a portion of the substance from glomerular filtrate, allopurinol strikes at a more susceptible place in the degradation pathway of the purines to uric acid. The experience to date is most encouraging. The drug must be taken regularly. Reports of allopurinol toxicity are minimal.

Some physicians are uncertain as to what diet to recommend in the intercritical period. I believe it much more important to give attention to the caloric intake if the patient has a tendency to obesity than to pay meticulous attention to the purine content of foods. A few substances high in purines, such as liver, kidneys, sweetbreads, which usually are not regular components of an average American diet, should be avoided. A good portion of red meat is allowable each day. I never issue printed diets to the patient. If he

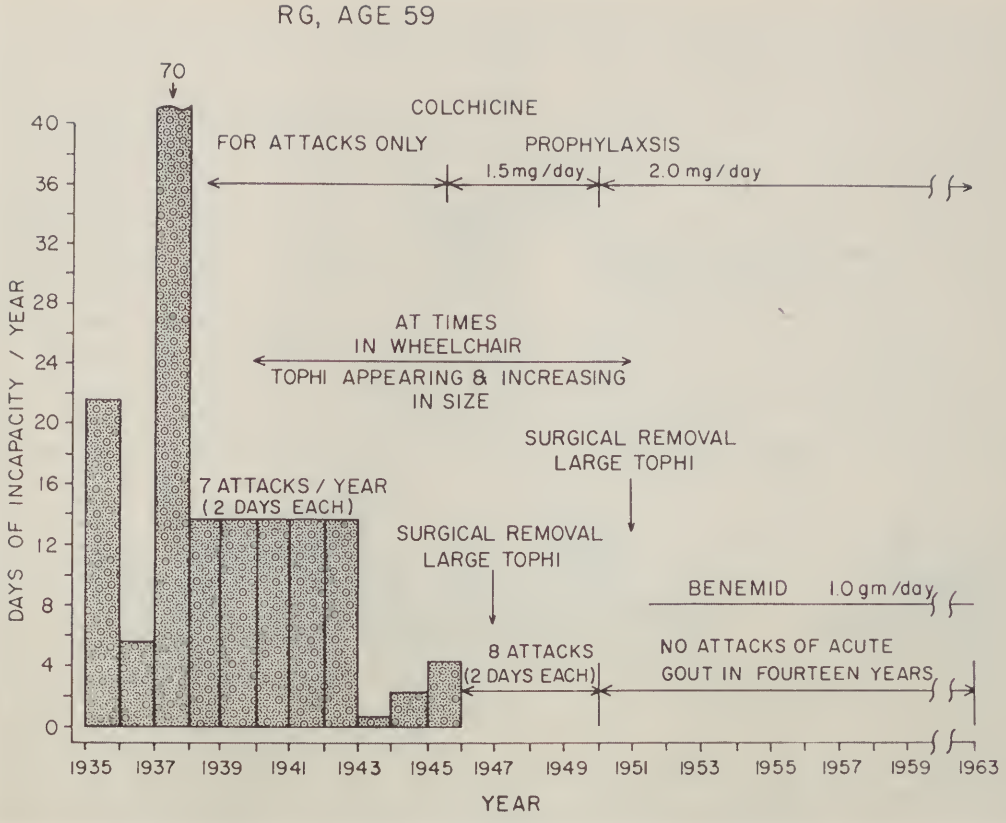

Fig. 9

takes his drugs regularly, he may eat what he wants except for a restriction of calories.

Irrespective of the uricosuric agent, the patient must have a high fluid intake. Since the solubility of uric acid in urine is not great, unless we provide added fluid for excretion, we may increase the tendency to formation of uric acid stones. On the other hand, a patient with a liberal fluid intake need not anticipate an increased incidence of renal stones. This conclusion is based upon a 10-year follow-up since the introduction of probenecid, in comparison with a previous 10-year period. I recommend no restriction upon the intake of alcohol. The harmful effects of alcoholic beverages have been noted in the literature for generations without control observations. There is little evidence that alcohol in moderation in any way deters the satisfactory clinical progress of the patient with gout on adequate and regular medication.

Figure 9 shows selected observations during a 30-year clinical history. One of the advantages of dealing with chronic disease is the opportunity to follow patients for long periods of time. We were provided a good record from this patient's family doctor before 1945, during which time he was getting into more and more trouble. When seen first, he was placed on colchicine for acute attacks only. Then he realized that the premonitory symptoms should be heeded with early administration of colchicine rather than waiting 24 or 36 hours to see whether a full blown attack was inevitable. He reported a significant reduction in days of incapacity with this change. But tophi began to appear and increase in size, and in 1947 several tophi were removed from his hands, knees, and feet. At that time he was placed on prophylactic colchicine, three tablets a day, and did very well. In 1952, probenecid, two tables a day, was added.

Observations on mortality include a 20-year follow-up of 47 patients. The total patient years exceeded 1,000. The expected number of deaths was approximately 26. Our observed mortality was approximately 27. No significant difference in the mortality from patients with gout from the average non-gouty white male in the United States was observed.

STANDARDIZED SENNA CONCENTRATE IN POSTPARTUM BOWEL REHABILITATION

A retrospective study of three years' experience with routine oral administration of a neuroperistaltic stimulant, standardized senna concentrate, in treating postpartum constipation suggests that the regimen employed is a highly satisfactory replacement for routine enema. Satisfactory evacuation with normal stools was achieved by the third postpartum day in 95% women studied. Most achieved such evacuation by the second postpartum day.

Enemas were required to obtain normal evacuation in 1.4%. This is an estimated saving of nearly 1,500 enemas, as compared with the usual third-day regimen.

The incidence of severe cramping was less than half of one per cent, and of all cramping, 3.7%. No other side effects were noted. There were no problems of acceptance of the medication, except in a few cases of severe cramping, some of which were probably caused by overdosage.

MICHAEL B. MONIAS, MD

Because constipation in the immediate postpartum period is the rule rather than the exception, enemas are often administered routinely on the second or third postpartum day. These can be uncomfortable and embarrassing to the patient, as well as relatively expensive and time-consuming —not an inconsiderable problem in the light of current concern over hospital costs and shortages of personnel.

Until mid-1960, it was our practice to administer enemas on the third postpartum day to patients who had not had an evacuation by that day. In an effort to eliminate this procedure, we substituted for it the routine oral administration of tablets of standardized senna concentrate (Senokot), a purified and standardized preparation derived from the deseeded senna pod. As a neuroperistaltic stimulant, this medication appeared to be specifically indicated for combatting the constipation attendant upon changes in the smooth muscle of the intestinal tract resulting from pregnancy and delivery,[1] enforced bed rest, reduced fluid and food intake, and surgical anesthesia and drugs associated with delivery.

From the Anne Arundel Hospital, Annapolis, Md.

This is a report of three years' experience with this regimen for treating postpartum constipation.

Method and Materials

Over the three-year period, standardized senna concentrate tablets were administered routinely to 1,924 postpartum patients. Of these, 521 were primiparas.

Doses of two tablets each were administered in the morning and in the evening of the first two postpartum days. Medication was discontinued when a patient had a normal evacuation. The maximum total dose was eight tablets. If no evacuation occurred by the evening of the third day, an enema was given.

When satisfactory evacuation took place initially after administration of the preparation on the first or second postpartum day, the result was rated *excellent*. When it took place initially on the third postpartum day, it was rated *good*. When there was unsatisfactory or no evacuation by the end of the third postpartum day, or when medication had to be discontinued before the course of therapy was completed, the rating was *poor*.

Results

Of the 1,924 patients treated with this regimen over a three-year period, 1,824 (95%) had satisfactory evacuation on or before the third postpartum day; 1,730 of these had satisfactory evacuations on or before the end of the second postpartum day.

There was no significant difference in results between primiparas and multiparas. Since most patients evacuated satisfactorily during the second day, after routine ingestion of the third dose, the average number of tablets per patient was six.

Of the 100 patients in whom the medication was adjudged poor, 73 had inadequate evacuation, and 27 required enemas because there was no evacuation. The enema rate over the three-year period was 1.4%.

Cramping was reported by 72 patients. It was severe in 11 cases, moderate in six, and mild in 55. This may have been due to overdosage in some cases. No other side effects were noted, and the medication was readily accepted except in the few cases of severe cramping. Most patients reported gentle evacuation with well-formed stools.

Comment

Several recent studies suggest that 75-85% of parturients, if untreated, do not have bowel evacuation by the end of the third postpartum day.[2-4] This accords with our impression based on experience before institution of the described regimen. Hence, about 1,500 enemas would have been administered, under prior practice, to the patients in this three-year series. Since 27 were actually administered, the saving in patient comfort and hospital expense was substantial.

Administration of the test tablets was initiated in the morning of the first postpartum day, since we feared that a longer waiting period might increase the amount of medication required for satisfactory evacuation and delay restoration of regular bowel function. With satisfactory evacuations occurring in 95% of all patients by the third postpartum day and the incidence of severe cramping in only little more than half of one per cent, we consider the oral regimen with standardized senna concentrate a highly satisfactory replacement for the third-day enema.

RESOLUTIONS

Important Notice for Component Medical Societies and Individual Members of Medical and Chirurgical Faculty

All resolutions or recommendations for presentation to the House of Delegates must be in the Faculty Office by Tuesday, March 1, 1966, which is eight (8) weeks prior to the Annual Meeting. This is referred to in the following quote from the Faculty Bylaws:

. . . A Reference Committee of five members of the House of Delegates to which all Resolutions involving questions of Faculty policy, except those proposed by the Council or committees of the Faculty, shall be referred at least eight weeks prior to any regular session . . . of the House of Delegates. All such resolutions shall be reported to the House of Delegates with the committee's recommendations, provided that, with the sponsor's approval, the committee may revise any resolution.

The meeting of the Reference Committee is open to all members of the Faculty in good standing, who may attend and express their opinions. Notice of the date and place of the Committee meeting will be sent to all members.

RESOLUTIONS for April 1966, House of Delegates must be in the Faculty Office by TUESDAY, MARCH 1, 1966

no significant weight gain

No statistically significant weight gain has been recorded in patients taking Provest for as long as 12 months. To avoid this undesirable side reaction while providing effective oral control of conception, you can put your patient on Provest. She'll be pleased.

Provest contains medroxyprogesterone acetate with ethinyl estradiol. Both of its components are close chemical approximations of the endogenous hormones involved in ovulation. Provest appears to be free of androgen-like effects; it has produced no hirsutism or voice change, and virtually no acne, in reports to date. Edema has occurred rarely. There have been no reports of liver dysfunction or jaundice, nor of associated chloasma or photosensitivity. The use of Provest has not been attended by any significant change in blood-coagulation pattern or the occurrence of drug-induced depression.

Provest can control conception only when the dosage schedule is faithfully adhered to. To make it easier for your patient to remember, each cycle-course of 20 tablets is supplied in the convenient "forget-me-not" Provest Daypak.*

For a complimentary supply, please write to Dept. 60,
The Upjohn Company, Kalamazoo, Michigan.

Contraindications: It is suggested that Provest not be used in patients with a history of genital or breast malignancy, thromboembolic disease, or hepatocellular or renal disease unless the advantages of this type of therapy outweigh the possible disadvantages. Precautions: Alert patients to possibility of amenorrheic cycle and instruct them to resume Provest tablets on the 7th day following their previous 20-day course, even though the menstrual flow failed to appear. Use drug with caution in patients with cardiac disease, epilepsy, migraine, or asthma. Since fibroids may increase in size with Provest use, watch patients with fibroids. Endometria submitted from patients taking Provest should be suitably labeled for the pathologist making the examination. Use drug carefully in patients with endocrine or metabolic diseases, such as diabetes, since it has not been evaluated in patients with all types of such disorders. Side Effects: Intermenstrual bleeding or spotting may occur, especially in the first two to three cycles of therapy and usually between the 15th to 20th days of medication. Suggested management: (1) spotting—no change in therapy; (2) menses-like bleeding (at mid-cycle or after)—increase to two tablets daily until bleeding recedes or consider this bleeding as a menstrual period, discontinue medication to allow withdrawal bleeding to be completed, and reinstitute therapy on the 5th day of the new cycle. Organic disease should be ruled out if persistent irregular intermenstrual bleeding occurs. Most side effects are those also found in early pregnancy: nausea and/or vomiting, breast tenderness, headache, fatigue, increased or decreased libido, or, very rarely, hair loss. These side effects are minimal and tend to disappear with continued treatment. Dosage and Administration: Administer cyclically one tablet daily from day 5 through day 24 of the menstrual cycle. Available: Provest Daypak of 20 tablets, and bottles of 500 tablets.

(medroxyprogesterone acetate with ethinyl estradiol)

CANDICIDIN

A NEW VAGINAL MONILICIDE

A Test Series

Vaginal infections have long been a thorn in the side of gynecologists. Of special prominence, both as to frequency of occurrence and difficulty of treatment, has been the trichomonas infestation. In recent years, however, moniliasis or candidiasis appears to be supplanting it as the primary vaginal invader. This apparently has been brought about, in part, by 1) the more general use of antibiotics and 2) the increased virulence or resistance, or both, of the causative yeast-like organisms. Vaginal moniliasis has long been a special problem in diabetics[1] and in pregnant patients, presumably because of a greater tendency toward monilial growth in the glucose-glycogen rich vaginal epithelium and secretions in these two conditions.

Reports as early as 1840, noting vaginal yeasts, indicated that these infections have been treated for decades with numerous agents and with varying results. Efforts to eradicate this condition have been less than uniformly successful, and a need for more efficacious therapy has persisted. While Pickhardt and Breen[2] reported that 99% of cases with vaginal moniliasis were cured with gentian violet, many required up to four two-week courses of treatment. Lang and co-workers[3] obtained a 52% cure rate in pregnant patients treated with nystatin. This was increased to 76% after a second course of treatment. In nonpregnant patients, the cure rate was 79% after one course and 92% after a second course. Other reported cure rates varied from 50% to 100%.

A new agent, candicidin (Candeptin), may be a solution to this problem. Isolated from a culture similar to *Streptomyces griseus,* candicidin has shown far greater *in vitro* antifungal activity than such well known drugs as nystatin and amphotericin B.[4]

PROCEDURE

The study group consisted of white private patients, gynecological and obstetrical, affected with vaginal *Candida albicans.* The age span of the subjects was 20 to 46 years, with most between 25 and 35 years. Symptoms ranged from none all the way to severe pruritis, vulvitis, vaginitis, and discharge. Duration of symptoms varied from nil (occasional asymptomatic patients in whom the infection was noted during routine office examination) to more than one year.

At the initial examination an evaluation was made of the severity and type of symptoms. A vaginal culture was then taken. The diagnosis of moniliasis in this study was limited to cases confirmed by a positive culture of vaginal secretions on either the Pagano-Levin Fungus Culture Medium or the Nickerson's Medium.

Patients were instructed to insert one vaginal tablet containing 3mg of candicidin in the morning

Fifty-one obstetrical and gynecological patients with culture-proven monilial vaginitis were treated with a new antifungal agent, candicidin. With candicidin vaginal tablets, results showed 78% initial successful treatment and 93% cure after retreatment of stubborn cases. Candicidin vaginal ointment produced 100% cure in a small series of patients. There were no untoward reactions to either medication. Both were well tolerated and accepted by the patients.

HERBERT J. FRIEDEL, MD

CLINICAL FINDINGS
Candicidin Vaginal Tablets

	No.	Cured After Single Course of Therapy	Cured After Additional Course of Therapy
Obstetrical patients	23	17 (74%)	22 (96%)
Gynecological patients	17	14 (82%)	15 (89%)
TOTAL	40	31 (78%)	37 (93%)

and evening for 14 consecutive days. Some patients received 5gm of medication in the form of a vaginal ointment containing 3mg candicidin and were instructed to insert one applicatorful of ointment morning and evening for 14 days. Those patients initially exhibiting negative cultures were excluded from the study. Those with positive cultures were rechecked for symptoms, and a repeat culture made one to five days after completion of the candicidin treatment. Those patients again showing positive cultures were given repeat treatment cycles as necessary. A follow-up culture was taken approximately four weeks after the completion of the treatment cycle. Patients were instructed to have their sex partner use a condom to prevent reinfection.

RESULTS

Sixty-four patients were observed, of whom 13 had negative initial vaginal cultures and were dropped from the study. Seven of those dropped had good relief of symptoms from the use of the medication, despite failure of proof of fungal involvement. Of the 51 patients constituting the study, 40 were given tablets and 11 were given ointment. Of the patients on tablets, 23 were obstetrical and 17 were gynecological. In the ointment series, three were obstetrical and eight were gynecological.

The table summarizes results of treatment with candicidin tablets. A cure rate of 89% or better was noted in both the obstetrical and gynecological subjects. Of the patients treated with ointment, the three obstetrical patients and five of the gynecological patients were cured after one course of treatment; the other three were cured after a second course. No irritation or sensitization occurred in the patients studied.

DISCUSSION

One treatment failure in each group (tablet and ointment study), after three cycles of medication, reported a penile irritation in her husband. The men involved were referred to a urologist for treatment, and a positive fungus culture was obtained after prostatic massage. The use of condoms was recommended to avoid conjugal reinfection, but resistance was encountered for personal and religious reasons. Somewhat more favorable results could be expected with at least temporary use of condoms.

There was general but not absolute correlation between severity of symptoms and resistance to cures. Patients in later pregnancy showed somewhat greater resistance than those in earlier stages. The results with both medications appeared comparable, with a slight superiority in the ointment. Tablets were easier to use, caused less leakage, and appeared more suited to obstetrical patients, in whom an applicator might be contraindicated.

New low-cost tetracycline/ antifungal therapy

Tetrex®-F

tetracycline phosphate complex –nystatin

Because new Tetrex-F (tetracycline phosphate complex-nystatin) is the most economical therapy of its kind that you can prescribe, it is a sound choice whenever tetracycline therapy is indicated in patients predisposed to monilial infections.

Who are these "candidates for Candida"?

1. diabetic patients
2. nonpregnant women with a history of recent or recurrent monilial vaginitis
3. elderly or debilitated patients
4. patients with a past history of moniliasis
5. patients on long-term tetracycline or corticosteroid therapy.

For these patients, Tetrex-F (tetracycline phosphate complex-nystatin) provides efficient tetracycline therapy against a broad range of infections *plus* protection against superinfection associated with the overgrowth of *C. albicans* in the G.I. tract.

Priced for savings

Tetrex-F (tetracycline phosphate complex-nystatin) is lowest in cost—priced 20% lower than most tetracycline/antifungal products.

BRISTOL THERAPEUTIC SUMMARY
For complete information consult Official Package Circular.
Indications: Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms, in patients with increased susceptibility to monilial infections.
Contraindications: The drug is contraindicated in patients hypersensitive to its components.
Warnings: Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. No cases of photosensitivity have been reported with Tetrex (tetracycline phosphate complex). With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood).
Precautions: Bacterial superinfection may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months.
Adverse Reactions: Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis, and allergic reactions may occur.
Usual Adult Dosage: 1 capsule q.i.d. Continue therapy for 10 days in beta-hemolytic streptococcal infections. Administer one hour before or 2 hours after meals.
Supply: Capsules, bottles of 16. Each capsule contains tetracycline phosphate complex equivalent to 250 mg. tetracycline HCl activity and 250,000 units of nystatin. Oral Suspension, 60-ml. bottle. Each 5 ml. contains tetracycline equivalent to 125 mg. tetracycline hydrochloride and nystatin, 125,000 units.

FIRST AMOS R. KOONTZ MEMORIAL LECTURES

APRIL 28, 1966, by Dr. Buxton and Dr. Ballinger, eminent representatives of the two medical schools with which Dr. Koontz was so prominently connected.

Robert W. Buxton, MD, professor of surgery and head of the department at the University of Maryland, will give a lecture honoring the memory of Amos R. Koontz, MD, an internationally known and respected member of the Medical and Chirurgical Faculty, who died this past year.

Dr. Buxton, born in Joplin, Mo., received his MD degree from Kansas University and MS degree from the University of Michigan. He interned at Strong Memorial Hospital in Rochester, N. Y., and served an assistant residency in both pathology and surgery there. He was a resident in surgery at the Genesee Hospital and the Strong Memorial Hospital, then a resident in thoracic surgery at the University of Michigan from 1941 to 1943. Between 1943 and 1955, Dr. Buxton was instructor, assistant professor, and associate professor of surgery at the University of Michigan. In September 1955 he was appointed professor of surgery at the University of Maryland. He has had more than 50 articles published in medical and surgical journals.

"Postgastrectomy Syndromes" will be the title of the Koontz Memorial Lecture given by **Walter F. Ballinger, II, MD**, associate professor of surgery at The Johns Hopkins University School of Medicine. Dr. Ballinger was born in Philadelphia, attended Cornell University and the School of Medicine at the University of Pennsylvania, where he received his MD degree.

He served an internship and residency in surgery at the Columbia Division of Bellevue Hospital and the Columbia Presbyterian Medical Center in New York between 1948 and 1956. He spent two years in the army. His investigative interests include gastrointestinal, metabolic, and hematologic problems applied to surgery.

DR. MULLAN AND DR. KAMPMEIER WILL SPEAK

John F. Mullan, BCh, BAO, professor of neurological surgery, University of Chicago, will give a lecture on the treatment of pain. Born in County Derry, Ireland, he studied medicine at Queens University, Belfast, Ireland, and graduated in 1947. He served a residency in general surgery in the Royal Victoria Hospital in Belfast, supplemented by a year's study at Middlesex and Guy's Hospitals in London. After obtaining a fellowship at the Royal College of Surgeons in England, in 1951, he turned to neurosurgery and came to the Montreal Neurological Institute in 1953, finishing his residency in neurosurgery in 1955.

He then came to the United States and became a full time staff member of the University of Chicago. He has been an assistant, associate, and full professor of neurological surgery, obtaining the latter in 1963. In 1957, Dr. Mullan was certified by the American Board of Neurological Surgeons. His special interests are the surgical treatment of pain, intracranial aneurysms, and epilepsy.

Born in Iowa, **Rudolph H. Kampmeier, MD**, received his medical degree from the State University of Iowa. He trained in internal medicine at the University of Michigan and he has been on the faculties of the Louisiana State University and Vanderbilt University for many years. He became professor of medicine emeritus at Vanderbilt in 1963 and has continued as director of the division of continuing education. Dr. Kampmeier is editor of the Tennessee Medical Journal and of the Southern Medical Journal. He is a past president of the Tennessee Medical Association and of the Southern Medical Association.

The May, 1964, issue of Medical Clinics of North America, which is a collection of papers dealing with syphilis and other venereal diseases, was dedicated to Dr. Kampmeier. An accomplished diagnostician and clinician, Dr. Kampmeier ranks among the most distinguished syphilologists. His lecture for the coming annual meeting is **"Syphilis: Then and Now."**

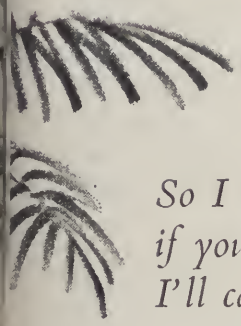
DON'T MISS THE BOAT! Make your reservations today for the Bermuda Cruise Convention April 29–May 4

During the Bermuda Cruise Convention

Dr. Cornbrooks

Dr. Mech

Dr. Rappeport



are among the lecturers

"**The Endometrial Aspiration Biopsy**" is the title of the lecture to be given by **Ernest I. Cornbrooks, Jr., MD.** Born in Newport News, Va., Dr. Cornbrooks graduated from St. Johns College, Annapolis, and received his MD degree from the University of Maryland. He was on a rotating internship at the University Hospital for two years, followed by an assistant residency and a residency in gynecology. He was a commander in the United States Navy from 1941 to 1946. He is a member of, and has held office in, numerous medical and lay organizations. He was certified by the American Board of Obstetrics and Gynecology in 1949. Dr. Cornbrooks is associate professor of gynecology at the University of Maryland School of Medicine and chief of the Oncology Clinic of the Greater Baltimore Medical Center.

Karl F. Mech, MD, will give a paper entitled "**Surgical Considerations in Gastrointestinal Bleeding.**" After receiving an MD degree from the University of Maryland School of Medicine, he served a surgical residency at St. Agnes Hospital, Baltimore. Since then he has been engaged in the private practice of surgery. Dr. Mech has taught at the University of Maryland continuously, except for four years of army service. During his army service, he had an active part in the development of the use of antibiotics, particularly penicillin, in the treatment of war wounds. His current positions are: associate professor of anatomy and assistant professor of surgery at the University of Maryland School of Medicine, chief of the department of surgery at St. Agnes Hospital, member of the Board of Medical Examiners of the State of Maryland, and treasurer of the Medical and Chirurgical Faculty. He is also a surgical consultant to the U. S. Army, serving at Fort Meade and the Veterans Administration Hospital at Fort Howard. Dr. Mech is certified by the American Board of Surgeons.

Jonas R. Rappeport, MD, president of the Maryland Psychiatric Society and assistant clinical professor of psychiatry at the University of Maryland School of Medicine, will speak on "**Sex in Marriage Counseling.**" Dr. Rappeport was born and educated in Baltimore, receiving his MD degree from the University of Maryland in 1952. He interned at Michael Reese Hospital in Chicago and took his psychiatric training at the University of Maryland Psychiatric Institute and the Sheppard and Enoch Pratt Hospital. He has held staff positions at the latter hospital and the Spring Grove State Hospital. He has been in the private practice of psychiatry since 1958 and has been court psychiatrist for Baltimore County since 1959. Dr. Rappeport is a Fellow of the American Psychiatric Association and a Diplomate in Psychiatry of the American Board of Psychiatry and Neurology.

So I said, "All right, Raymond, if you don't take your cough medicine this minute, I'll call Doctor Peabody."

Controlling the child is sometimes as big a problem as controlling his cough. But with most children and with most coughs, the job is usually much easier with one of these effective Novahistine formulas.

If it's the useless, exhausting type of cough that often accompanies respiratory infection or allergy, you can provide prompt relief with Novahistine DH. Its decongestant-antitussive action controls frequency and intensity of cough spasms without abolishing cough reflex. And the fresh grape flavor of Novahistine DH appeals to children and adults alike.

When your diagnosis is bronchitis, complicated by thick tenacious exudates, Novahistine Expectorant is particularly useful. It not only provides decongestive action and controls the cough, but also encourages expectoration, thus easing bronchial obstruction.

Use with caution in patients with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Ambulatory patients should be advised that drowsiness may result. Continuous dosage over an extended period is contraindicated since codeine phosphate may cause addiction.

Each 5 ml. teaspoonful of Novahistine DH contains codeine phosphate, 10 mg. (Warning: may be habit forming); phenylephrine hydrochloride, 10 mg.; chlorpheniramine maleate, 2 mg.; chloroform (approx.), 13.5 mg.; l-menthol, 1 mg. (Alcohol 5%). Each 5 ml. of Novahistine Expectorant contains the above ingredients and, in addition, glyceryl guaiacolate, 100 mg.

NOVAHISTINE® DH

HISTORY OF THE BALTIMORE CITY HOSPITALS

BY DOUGLAS CARROLL, M.D.

Chapter 2.—Physicians, Medical Education and Almshouses: Advances in Baltimore (1773-1822)

The zeal for study and eager desire of acquiring knowledge, that at present distinguish the students of medicine in Baltimore, have with much satisfaction been observed by some of the physicians of this place, who being desirous to aid and cherish as far in their power so laudable a spirit have entered into an association to establish a medical school here the ensuing winter, where youth who are engaged in the study of physic shall have opportunities of hearing courses of lectures . . . the advantages to be derived from a public hospital are too apparent to require illustration . . . At an early period of the ensuing winter courses of lectures . . . will commence:

(Andrew Wiesenthal's advertisement for medical students, Maryland *Journal* for March 29, 1790.)

Almshouse Physicians in the Eighteenth Century

During the early years of the Almshouse, a number of distinguished men served as visiting physicians. In 1789, Dr. Andrew Wiesenthal (1762-1798), the son of Baltimore's leading physician, returned to Baltimore. He was a sanguine and ebullient young man-about-town, an accomplished musician, who had enjoyed his three years of training at St. Bartholomew's Hospital in London. He became attending physician at the Baltimore Almshouse in 1789. This gifted physician made a major contribution to medical science when he discovered that a round worm in the trachea was the cause of syngmosis ("the gapes"), an important epizoötic disease in domestic fowl. This was the first discovery ever made of an organism's producing an infectious disease or epidemic. The posthumous report of his findings appeared in the London *Medical and Physical Journal* of 1799. Together with several other physicians who had been inspired by the advanced medicine in Europe and appalled by the low state of medical practice in the United States, he founded a medical school, hoping to use the Almshouse as a source of patients to be demonstrated to the students.

In England, the medical schools had been organized around hospitals rather than around physicians in practice. This method had been tried at the Pennsylvania Hospital (opened in 1752) but had not been successful because the physicians found it more profitable to give lecture courses and receive fees directly from each student. The same thing happened in Baltimore. Since there were no licensing boards, no diploma was needed to practice medicine. Not until 1870, after many heartbreaking attempts, was the apprenticeship system finally abandoned (at Harvard and Pennsylvania). Universities took over the quality control of medical education and the awarding of diplomas. Medical teachers went onto the payroll of the medical schools.[1] Unfortunately, Weisenthal's efforts to found a medical school was not carried beyond a series of lectures on anatomy and surgery to a class of 15 students in 1789-90. At the same time, George Buchanan, an Edinburgh student and graduate of the University of Pennsylvania in 1789, lectured on diseases of women and children. The medical school closed with Weisenthal's early death.

The Almshouse was not used for patient mate-

rial until about 1812, when Drs. William Gibson and Samuel Baker, professors of surgery and materia medica at the College of Medicine of Maryland (later the University of Maryland Medical School), accepted visiting physician appointments at the Almshouse on condition that their students should have the privilege of clinical instruction there. The clinics at the Almshouse were chiefly surgical operations.[2]

During the last decade of the eighteenth century, the seeds of a Baltimore medical school were planted. In addition, the Medical and Chirurgical Society of Maryland was started by many of those interested in medical education. In 1793, Baltimore started the first continuously operating health department in the United States.[3]

Another distinguished physician associated with the Almshouse was Dr. James Smith (1771-1841). Called the Father of Vaccination in Maryland, he started the widespread practice of vaccinating against smallpox in 1801. He kept good case records. These show that his first patient was Nancy Malcum, age 7, an inmate of the Almshouse.

The founding of vaccination schools by the national government (one of the first under Dr. Smith in 1813) was one of the earliest examples of federal interest, financing, and responsibility in public health. Medical advances continually demonstrated that major communicable diseases could be prevented by control of water supply and sewage disposal, by quarantine and isolation, by mass vaccination, and by food and milk inspection.

The trustees of the Almshouse in 1818[4] reported that there was an overseer, a full time physician and seven visiting consultant physicians and surgeons, a purveyor, a druggist, and a matron. All of the physicians and surgeons were professors at the newly founded College of Medicine of Maryland. The inmates led a spartan life. All rooms were whitewashed with good quicklime and slaked with boiling water in the spring and fall. One bed was allowed for each adult. No more than two children could occupy a single bed. The bed ticks were washed and filled with clean fresh straw and the blankets washed twice a year.

Public interest in medical education continued. Although knowledge then was meager compared with today, there was a widespread demand for more physicians. Furthermore, hospitals were rapidly becoming physicians' workshops.[5] Reputations could be made in hospitals. Their superior opportunities for student teaching were recognized. At the Baltimore City and County Almshouse in 1818, students of medicine and surgery were urged to accompany visiting physicians, on payment to the trustees of $10 a year. Two medical students were boarded and lodged for two years on the payment of $150 each.

After 1805, the city needed the land on which the Almshouse stood for residential development. In 1819, 306 acres west of the city was bought for the Almshouse, and all the inmates were removed to that location in 1822.

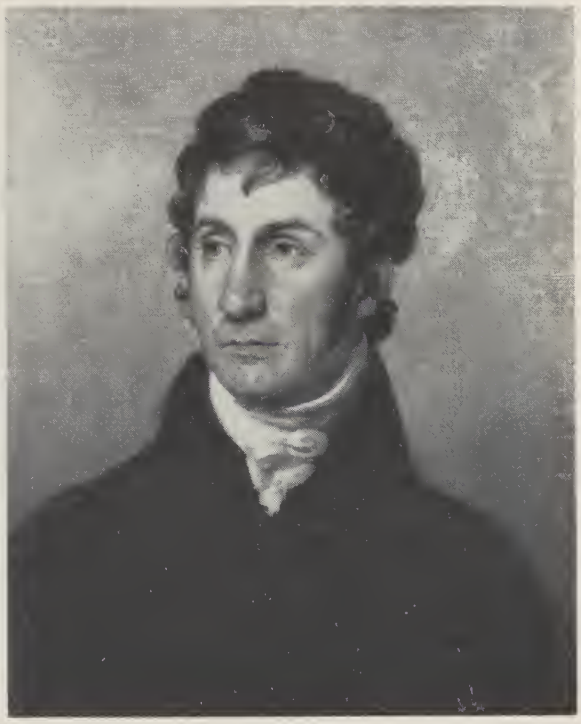

Fig 1

James Smith (1771-1841) AM, Dickinson College (1792), pupil of Dr. Benjamin Rush, University of Pennsylvania (1794), resident physician, Baltimore City and County Almshouse (1800-01), performed his first vaccination on May 1, 1801 (less than a year after Benjamin Waterhouse performed the first vaccinations in the United States) at the Almshouse. He did a great deal to publicize and establish vaccination in the United States.

(Artist, Rembrandt Peale (1778-1860), painted around 1813-15. Dangerfield Collection, The Baltimore Museum of Art)

Changing Function of the Baltimore Almshouse

During this early period, the Almshouse and Workhouse were used as a depository for the social problems of the growing city. "Rogues, vagrants, vagabonds, beggars, and other idle, dissolute, and disorderly persons" were sentenced for three months of hard work in the Workhouse. The Almshouse took care of the infirm, the orphans, the sick, the insane, the psychopaths and the "juvenile delinquents."[6] As time went on, the need to separate the various groups from the Almshouse and Workhouse became evident. The penitentiary, in 1811, took some of the criminals who did not properly belong in the Workhouse. In 1828, the state began to take some of the pauper insane at the Maryland Hospital, located at the site of the present Johns Hopkins Hospital.

Orphans have always been an especially appealing group for charitable efforts. The Baltimore Female Orphan Society, established in 1808, afforded shelter and education to destitute orphans.[7]

Thus, during the period 1773-1822, the State of Maryland began to take some responsibility for the insane and the criminals; private charity helped, particularly with children. From a welter of social problems of all types, specialized institutions arose to cope with particular problems.

American Almshouses

Compared to similar sized almshouses in London[8] during this period, the Baltimore Almshouse was less crowded and administration was less suppressive. Physicians in private practice appointed to visit at a hospital could build a reputation in the community. The Almshouse was the only institution in which sick people were cared for. The leading physicians of Baltimore were, therefore, willing to give their time for teaching and patient care. The leading physicians and professional people were eager to serve as trustees.

COMPONENT MEDICAL SOCIETIES

WICOMICO COUNTY

Charles Bagley, III, MD, was installed as 1966 president of the Wicomico County Medical Society, Inc., at its December meeting. The third generation of his family to serve as a medical society president, Dr. Bagley has practiced psychiatry in Salisbury since 1961. Active in many professional organizations, he has also been chief of the Department of Psychiatry at the Peninsula General Hospital for the past year.

Other new officers include **Marcus Stephanides, MD,** vice-chairman and president-elect; **Robert L. Dickey, MD,** secretary-treasurer; **Richard E. Hughes, MD,** member of the Board of Censors; **H. Douglas Cooper, MD,** and **Andrew C. Mitchell, MD,** delegates to the Medical & Chirurgical Faculty; and **Frank E. Poole, MD,** and **Robert T. Adkins, MD,** alternate delegates.

Mr. Jack Ward was the speaker for the program. He discussed the organizational structure of Jehovah's Witnesses and the background of their beliefs leading to refusal of blood transfusions. A general discussion followed on medical treatment of Jehovah's Witnesses within the framework of their faith.

Mr. David Pedwell, also a member of this faith, concluded the program by expressing willingness of Jehovah's Witnesses to cooperate with the medical profession in attempting to meet medicolegal problems involved.

All in attendance agreed that progress was made in clarifying this situation, including moral problems faced both by members of Jehovah's Witnesses and by the physicians who treat them.

Mrs. Kit Hargreaves

THE Regent

Nursing & Rehabilitative Treatment Center

operated under the direct supervision of the Lowry Memorial Medical Center.

Offering full treatment to the adult physically handicapped, specialized care to the senior citizen, and convalescent care to post-stroke and post-operative cases. Separate area for cancer patients. *All facilities available to private physician.*

Professionally staffed and equipped Physical Therapy gymnasium, under the direct supervision of a specialist in physical medicine. There is also an organized program of recreation.

Everything at The Regent is designed to be used by wheel chair patients.

Adjacent to the Penn-Mar Shopping Center on Marlboro Pike Beltway Exit 34

this part for diarrhea

Kaolin exerts a demulcent action along the gastrointestinal tract and a detoxifying action in the intestines to diminish irritation of the mucosa and lessen hyperperistalsis, nausea and diarrhea.

Pectin exerts its demulcent effect in the entire tract and its detoxifying action primarily in the large bowel to diminish irritation of the mucosa and help restore normal intestinal flora and function.

this part for its discomforts

Belladonna alkaloids as in Donnatal® relieve hypermotility of smooth muscle in the gastrointestinal tract to help control cramping, nausea, and painful straining. Many clinicians consider the belladonna components of Donnagel® to be medicine's most effective depressants of intestinal motility.[1,2] A preparation containing only kaolin and pectin, on the other hand, has "little or no effect on cramps simply because it does not include an agent with antispasmodic action."[3]

Donnagel® treats the whole diarrhea problem.

Available in new 4-ounce plastic bottle on your prescription or recommendation. Also available: Donnagel®-PG (with paregoric equivalent) and Donnagel® with Neomycin. See product literature before prescribing.

"CLEAR THE TRACT" WITH

Coughing ahead...
Clear the Respiratory Tract with Robitussin.

Much more than just a slogan, "clear the tract" reflects the dependable antitussive-expectorant action of the three Robitussin formulations. All contain glyceryl guaiacolate, the time-tested expectorant that greatly enhances the output of lower respiratory tract fluid. Increased RTF volume exerts a demulcent effect on the tracheobronchial mucosa, promotes ciliary action, and makes thick, inspissated mucus less viscid and easier to raise. Glyceryl guaiacolate is safe, non-narcotic, and almost universally accepted by patients of all ages.

NOW! THREE ROBITUSSIN FORMULATIONS	ROBITUSSIN	ROBITUSSIN A-C	ROBITUSSIN-DM

The Lymph Node Biopsy in Infectious Diseases

D. J. WINSLOW, MD
R. J. HARTSOCK, MD

THE PATHOLOGIST FREQUENTLY has the difficult problem of determining the cause of an infectious process from a surgically excised lymph node. The complete biopsy specimen may have been placed in fixative in the operating room, and no fresh tissue is available for culture or animal inoculation. Sections of the lymph node must be studied to determine the type of lesion and the presence or absence of microorganisms. Numerous infectious agents may be found in properly stained sections of lymph nodes, including viruses, rickettsiae, bacteria, fungi, protozoa, and helminths. Microscopic examination of many slides and the use of the oil-immersion objective may be required to define the offending organism.

There seems to be no simple, economical method for determining the cause of infectious processes in lymph nodes. The pathologist should, of course, be informed of the patient's history and the clinician's opinion as to possible diagnoses. The fresh biopsy specimen may be examined aseptically by the pathologist. A magnifying glass or dissecting microscope will aid in the study of lesions on the cut surfaces. Smears and imprints may be stained for bacteria or other microorganisms. A small part of the lymph node may also be sectioned with a freezing microtome and a hematoxylin-eosin-stained section quickly obtained. By this means the pathologist may get a clue as to which media or animals should be inoculated. Cultures and, if indicated, animal inoculations should be made with tissue removed aseptically from the inner part of the lymph node.

At least half of the lymph node should be fixed immediately in neutral, buffered formalin. Other fixatives may be used, but formalin is the best general fixative. When the specimen is trimmed before embedding, a portion should be preserved in formalin for possible later use.

Tissue reactions in lymph nodes are limited and therefore are not diagnostic of a specific etiologic agent; nevertheless they alert the pathologist to certain cause-and-effect relationships. In general, the results of cultures must be supported by the histologic features, since microorganisms not directly related to the lesions sometimes are recovered by cultural methods. The presence of a malignant lymphoma in the periphery of a necrotic lymph node may be missed if the pathologist focuses his attention on the necrosis and the bacteriologist's report. In cultures taken from a lymph node, the possibility of a contaminant must always be considered. Negative cultures, on the other hand, may be due to fastidious or nonviable microorganisms, which nevertheless may be demonstrated by appropriate histologic technics.

From the Armed Forces Institute of Pathology and the Veterans Administration Central Laboratory for Anatomic Pathology and Research, AFIP, Washington, D. C. Dr. Winslow is chief, Infectious Diseases Branch, and Dr. Hartsock is chief, Hematologic Pathology Branch.

By careful histologic study and the application of special stains, it is possible to make an etiologic diagnosis in many infected lymph nodes. At the Armed Forces Institute of Pathology we have found the following stains of value in screening sections for a causative agent[1]:

Hematoxylin-eosin (H&E)

Virus inclusion bodies
Many bacteria
Viable fungi
Protozoa
Higher parasites

Giemsa (Giemsa)

Ricksettsiae
Most bacteria
Viable fungi
Protozoa
Higher parasites

Warthin-Starry (W-S)

Bacteria, including Donovan bodies, spirochetes, and Klebsiellae

Acid-fast stains

Ziehl-Neelsen for *Mycobacterium tuberculosis* (Z-N)
Fite-Faraco for *M leprae* (F-F)
Modified Fite-Faraco for Nocardia (F-F Mod.)[2]

Special stains for fungi

Gomori's methenamine-silver nitrate technic (GMS)[3]
Gridley's stain for fungi
Periodic acid-Schiff reaction (PAS)
Mayer's mucicarmine (Muci)
Mowry Modification of the Hale (Muller) colloidal iron stain for acid mucopolysaccharides (AMP)[4]

Special stains for bacteria

MacCallum-Goodpasture
Brown and Brenn Gram stain

For routine screening, the following stains are usually adequate: H&E, Giemsa, F-F, and GMS. These stains will demonstrate most agents that can be visualized by light microscopy in viral, rickettsial, bacterial, mycotic, and parasitic diseases. A W-S stain should be added whenever spirochetal infection, granuloma inguinale, or scleroma is a possibility.

If microorganisms are found by one or more of the screening stains it then may be necessary to apply one of the other differential stains listed above. For example, the yeastlike cells seen in a caseating granuloma stained with the GMS technic can be further evaluated by applying Muci and AMP stains. If the cell wall or capsule is stained positively by these stains and blastomycosis can be ruled out by other features, the yeast cells can be diagnosed as *Cryptococcus neoformans. Blastomyces dermatitidis* and *Paracoccidioides brasiliensis* must be considered when the walls of the yeast cells are stained only slightly by Muci and are positively stained by AMP. Other morphologic features will usually aid in the differentiation. If the walls of the yeast cells do not react positively to Muci and AMP stains, a diagnosis of *Histoplasma capsulatum* can usually be made on the basis of morphologic and tinctorial criteria. In occasional cases, fluorescent antibody reactions are necessary and helpful in differentiating between *Histoplasma, Cryptococcus,* and *Blastomyces.* At the AFIP it has been possible to make a diagnosis of a specific infectious disease in numerous lymph nodes by microscopic examination of histologic sections and the use of special stains. The following cases will illustrate:

CASE 1

The patient was a 10-year-old white Brazilian boy with progressive enlargement of lymph nodes, beginning with the lymph nodes of the neck. There was a history of progressive wasting, cough, and anorexia of one year's duration. Physical examination revealed generalized lymphadenopathy, enlargement of liver and spleen, and an ulcerated lesion of the epiglottis. An x-ray film of the chest showed enlargement of mediastinal lymph nodes, but no pulmonary

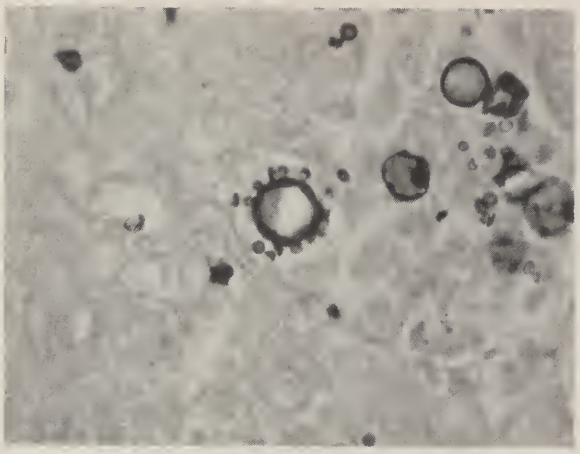

Fig 1

Case 1. Yeast cells of Paracoccidioides brasiliensis **in lymph node. Gomori methenamine-silver stain. X 1080. (AFIP Neg. 65-12065)**

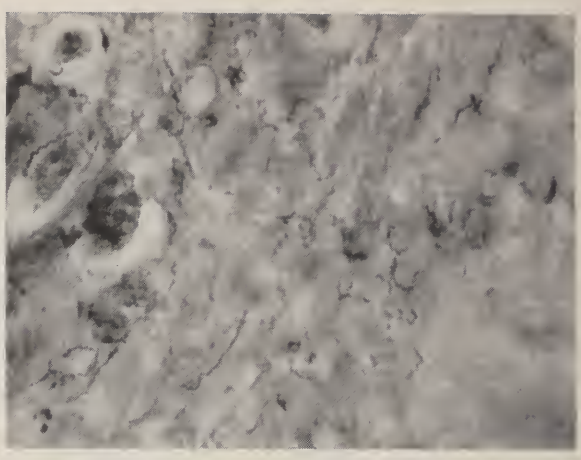

Fig 2

Case 2. Treponema pallidum **in section of lymph node. Warthin-Starry stain. X 1800. (AFIP Neg. 65-12066)**

lesions were seen. A cervical lymph node was excised and submitted for examination.

Histologic examination of H&E sections of the lymph node revealed massive necrosis, in which it was practically impossible to identify an etiologic agent. Since, however, there were structures present that looked as if they might be large yeast cells, a GMS stain was applied. This revealed numerous yeast cells, many of which demonstrated multiple peripheral budding characteristics of *Paracoccidioides brasiliensis* (fig 1).

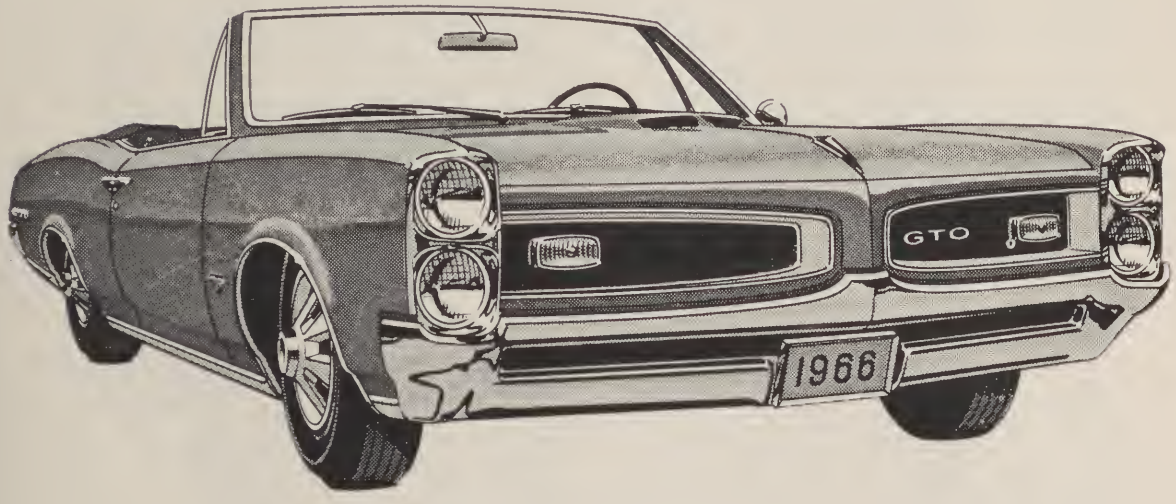
Diagnosis: South American blastomycosis.

CASE 2

The patient was a 25-year-old white man who had a painful mass in the left inguinal region for three weeks. At surgery he was found to have multiple enlarged femoral lymph nodes overlying the inguinal ligament. There was no generalized lymphadenopathy. There was a small crusted sore on the under side of the penis, which the patient stated was due to trauma.

Histologic examination revealed a severe subacute lymphadenitis and perilymphadenitis with focal areas of severe vasculitis. In view of the history and the histologic picture, W-S preparations were made, and microscopic examination revealed numerous spirochetes with the typical morphologic features of *Treponema pallidium* (fig 2).

Diagnosis: Syphilis.



The lymph node biopsy is an important procedure in many infectious diseases. Often it offers the first or only means to a conclusive diagnosis. The excised lymph node can be studied by different methods, including those used in virology, bacteriology, and mycology. Histologic methods allow visualization of the disease in its biologic setting. Frequently the etiologic agent can be seen within the tissues and correlated with the lesions, the clinical history, and the microbiologic investigations. As a result, the clinician is able to begin specific treatment promptly.

Which Is Pyloroplasty with Vagotomy?
Which Is Pro-Banthine?

Photographs—Harry Barowsky, M.D., Lawrence Greene, M.D., and Robert Bennett, M.D., from a Scientific Exhibit presented at the Annual Meeting of the American College of Gastroenterology, Bar Harbour, Florida, Oct. 24-27, 1965.

Another example of
Pro-Banthine®
(propantheline bromide)
a true anticholinergic in action

Normal relaxed pyloric antrum; contracted pylorus (pyloric fleurette)

The true anticholinergic values of Pro-Banthine have never been so graphically realized as they are with the recent development of fibergastroscopy and the intragastric camera.

Pro-Banthine consistently produces complete relaxation and immobility of the stomach with a dose of only 6 to 8 mg. intravenously. This is less than half the usual dose orally.

Atropine, on the other hand, required 0.8 mg. intravenously, or twice the normal dose, to achieve a similar effect. This high dose of atropine resulted in expectedly adverse side effects.

Pro-Banthine, in minimal dosage, produces effects similar to pyloroplasty and vagotomy without the disadvantages of permanent post-vagotomy sequelae.

The intragastric photograph A is of a patient who has had pyloroplasty with vagotomy. Photograph B is of a patient given 6 mg. of Pro-Banthine.

Indications: Peptic ulcer, functional hypermotility, irritable colon, pylorospasm and biliary dyskinesia.

Oral Dosage: The maximal tolerated dosage is usually the most effective. For most *adult* patients this will be four to six 15-mg. tablets daily in divided doses. In severe conditions as many as two tablets four to six times daily may be required. Pro-Banthine (brand of propantheline bromide) is supplied as tablets of 15 mg., as prolonged-acting tablets of 30 mg. and, for parenteral use, as serum-type ampuls of 30 mg.

Side Effects and Contraindications: Urinary hesitancy, xerostomia, mydriasis and, theoretically, a curare-like action may occur. Pro-Banthine is contraindicated in patients with glaucoma, severe cardiac disease and prostatic hypertrophy.

Medical Care in a Baltimore Nursing Home

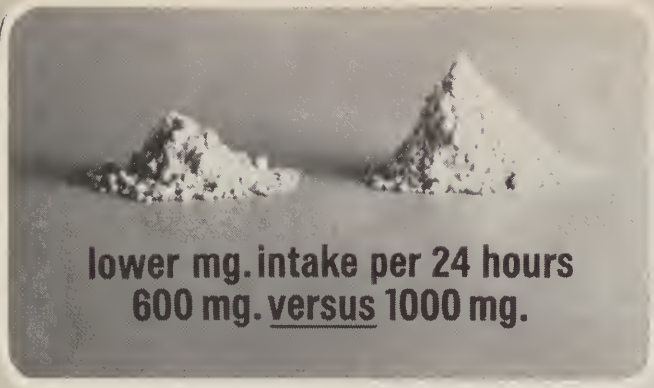
DOUGLAS G. CARROLL, MD

The Medicare bill requires that all patients being admitted to nursing homes be given a three-day diagnostic investigation in a hospital. The question arises whether adequate standards of medical care are maintained in the nursing homes of Baltimore. A study made in 1961 and 1962 of the inmates of a Baltimore nursing home suggests that present standards and practice are inadequate.

* * * * *

On July 14, 1961, the Camphor Nursing Home in Baltimore City was closed suddenly by the Maryland State Health Department because of overcrowding. Twenty-four inmates of the home were transferred to the Baltimore City Hospitals for care.

A study of these patients has revealed that their medical care and rehabilitation needs had not been met in the nursing home. Although evidence shows that little effort was made at this nursing home to supply adequate medical care and rehabilitation facilities, it is important to note that the nursing home was closed not because of inadequacies in these areas but because of overcrowding. It is probable, therefore, that the inadequacies found in this home exist to some extent in other nursing homes.



A. Age, Sex, Color, Marital Status, Living Relative, and Financial Support

The average age was 73.3 years (two of unknown ages), with a range from 51 to 96. Twelve

the option of b.i.d. dosage

the "extra" benefits raise the level of antibiotic control

DECLOMYCIN
DEMETHYLCHLORTETRACYCLINE
150 mg. CAPSULES

Effective in a wide range of everyday infections—respiratory, urinary tract and others—in the young and aged—the acutely or chronically ill—when the offending organisms are tetracycline-sensitive.

Side effects typical of tetracyclines include glossitis, stomatitis, proctitis, nausea, diarrhea, vaginitis, dermatitis, overgrowth of nonsusceptible organisms, tooth discoloration (if given during tooth formation) and increased intracranial pressure (in young infants). Also, very rarely, anaphylactoid reaction. Reduce dosage in impaired renal function. Because of reactions to artificial or natural sunlight (even from short exposure and at low dosage), patient should be warned to avoid direct exposure. Stop drug immediately at the first sign of adverse reaction. It should not be taken with high calcium drugs or food; and should not be taken less than one hour before, or two hours after meals.

Capsules, 150 mg. and 75 mg. of demethylchlortetracycline HCl.

Average Adult Daily Dosage: 150 mg. q.i.d. or 300 mg. b.i.d.

Anemia, cause undetermined	2	
Positive serologic test for syphilis	6	
Positive spinal fluid serologic test for syphilis	1	

were men; 18 were Negro. None had a living spouse. At least nine had living children.

B. Diagnosis

Most of the patients had more than one potentially fatal disease. Table 1 lists the diagnoses found after complete investigation in the hospital. Those apparently causing major disabilities are listed first, but all significant diagnoses are listed to show what diseases existed in these patients. It is obvious that arteriosclerosis of the vessels of the brain, heart, and extremities accounted for the major difficulties.

C. Undetected Diseases Present

Table 2 shows that nine neoplasms were discovered, of which four were malignant. A meningioma was suspected but could not be diagnosed by an elaborate neurosurgical investigation; the patient died. One patient refused biopsy of a breast tumor. Two patients had unexplained thrombocytopenia and two had anemia, the causes of which remained unexplained. Serologic test for syphilis was positive in six patients. Four gave no history of treatment. Since *no medical records were available on these patients,* it was assumed that they had not been treated. One patient had a positive spinal fluid serologic test for syphilis.

D. Conditions Requiring Treatment

Table 3 shows measures carried out in the hospital which probably would not have been done in the nursing home. Two patients were treated for heart failure with improvement in their independence. One patient required regulation of his diabetes mellitus. Seven biopsies were performed, revealing four benign and three malignant neoplasms. Transurethral prostatic resections were performed in three patients. Orchidectomy was performed in one patient with metastatic prostatic cancer, in whom the diagnosis had been made but no treatment instituted. Two patients were bilateral amputees. One died of parotid carcinoma; the other was fitted with a below-knee prosthesis and was able to ambulate. The four patients with positive serologic tests for syphilis and an absent history of treatment were treated. One patient had bilateral inguinal hernias successfully repaired. Cystolithotomy and urethral dilation were required in one patient.

E. Degree of Independence in Activities of Daily Living

Fourteen patients were completely independent in activities of daily living (ADL score 100); that is, they could take care of their toilet needs, their feeding, washing, personal toilet, and dressing and were independent in walking and

There are many nursing homes in Baltimore –

but only one **CONVALESARIUM**

WHY has the word Convalesarium, in one short year, come to mean something special in superior nursing home care?

WHY has the Convalesarium been recommended by leading physicians?

WHY have other nursing homes followed the lead of the Convalesarium, so far as their facilities would permit?

Here are a few of the reasons

- **Ultra-modern equipment—luxurious furnishings**
- **Complete health care facilities—piped-in oxygen—physio-therapy equipment**
- **Intensive Nursing Care (which few homes can furnish)—Registered Nurses 24 hours**
- **Drive-in showers — elevated tubs — many more exclusive features**

RATES BEGIN AT LESS THAN $10.00 A DAY
OWNER-MANAGER ON DUTY ASSURES PERSONAL SUPERVISION

BALTIMORE, MD. 21206

climbing stairs. Two were independent in all activities except stair climbing (ADL scores 86-95). Six were semi-independent (ADL scores 46-85) and required no special nursing services. Only two required extensive nursing care (ADL scores 1-10 and 11-25). Both of these patients died within six months of admission. The causes of death in the six patients who died were as follows:

1. Mucoepidermoid carcinoma of the parotid with metastases
2. Meningioma
3. Carcinoma of the prostate with metastases
4. Carcinoma of the stomach with metastases
5. Arteriosclerotic heart disease with enlarged heart, atrial fibrillation, and heart failure
6. Arteriosclerotic heart disease with enlarged heart, right bundle branch block, heart failure, cerebrovascular infarction with hemiplegia, diabetes mellitus with diabetic glomerulosclerosis and pyelonephritis.

Only six patients had no medical, surgical, psychiatric, rehabilitation, or nursing needs. All patients had inadequate financial, familial, and domiciliary resources.

Summary

This study demonstrates some of the medical problems arising in a nursing home. A number of unsuspected neoplasms were detected. The fact that some of these were benign is a matter of chance. Several others were malignant and possibly were curable had they been detected earlier.

Several patients were improved by better control of heart failure, diabetes mellitus, and prostatic hypertrophy. Two patients benefited by physical therapy.

This nursing home kept no medical records on any of its clients.

Adequate medical care for such patients requires an initial comprehensive medical, surgical, social, and rehabilitation investigation at the time of admission, facilities for follow-up and periodic health surveys, and continuous medical supervision and mobilization of all community resources to meet individual and group needs.

Is Cancer Curable by Radiation Therapy?

MORRIS J. WIZENBERG, MD
Assistant Professor of Radiology, Division of Radiation Therapy, University Hospital

Can patients with cancer be cured by radiation therapy, or are they merely being offered palliation or temporary arrest of the disease which will eventually cause their death? I am afraid that all too many patients and physicians share the latter view, for while many know the value of radiation therapy in palliation, few are aware of its curative role.

Cancer is not cured by the simple eradication of every tumor cell from the body. A patient who dies as a result of treatment, even though subsequent autopsy shows no evidence of residual neoplasm, is no less dead of cancer than one who dies with active tumor. Conversely, a patient who dies of some unrelated disease many years after apparently successful treatment of cancer has, for all purposes, been cured even if, in an exceptional case, autopsy reveals a focus of tumor cells in a fibrotic scar at the site of former activity. In the case of most cancers, death occurs in one or two years if no treatment is given, while the incidence of recurrence is small in those patients who survive for at least five years with no evidence of residual or recurrent neoplasms. Indeed with many tumors, such as Wilms tumor or testicular carcinomas, recurrences are rare after two to three years. Five-year tumor-free survival is, therefore, a quite sensitive indicator of cure, except for certain tumors such as breast or prostatic cancer.

Let us then look at some of the available data to see whether patients are cured. Hodgkins disease seems afflicted with a name which often paralyzes both patient and physician with fear and depression; yet Easson has shown that patients with localized disease may expect 15-year survival of 40%, and the mortaliy curve thereafter parallels that of a comparable normal population group. Even in the case of generalized Hodgkins disease, 15-year survivals as high as 11% have been reported. Seminoma can be treated to yield five-year "cure" in about 90% of cases, and the rarity of recurrence after the second year justifies the belief that most of these patients are indeed cured. Teratocarcinoma of the testis, when metastases are clinically evident, almost invariably leads to death within one year. When it is noted that about 50% of patients with teratocarcinoma of the testis have unsuspected retroperitoneal metastasis, survival of 42% of patients treated by excision of the primary and radiation therapy to the para-aortic nodes, as reported by Smithers, is highly significant. The efficacy of radiation therapy for cancer of the cervix is so well documented as to require no further comment.

Most epithelial tumors of the head and neck are lethal in one to two years in the absence of treatment. Radiation therapy can produce five-year cures in 80% or more of patients with vocal cord tumors. Twenty-five per cent of patients with nasopharyngeal cancer may be cured by irradiation, and for anatomical reasons, this is the only possible form of treatment in such cases. I could continue to add tumor upon tumor and evidence to evidence to substantiate this trend.

In affirming that radiation therapy can cure cancer, I do not mean to imply either that other methods of therapy cannot or that radiation therapy is the ideal form of cancer therapy. We must realize that even with the best treatment available, too many patients die of uncontrolled tumor. Many of these patients are beyond help other than palliation when first seen. We have had no mirac-

ulous breakthrough in cancer therapy; nor is there the slightest shred of evidence that a breakthrough will occur soon. Advances in the development of curative chemotherapy undoubtedly will be made slowly and probably will affect only one variety of cancer at a time.

Perhaps the near future will bring some answer which will make present therapy obsolete, but until then let us use our available therapy for greatest effect. To persist in the belief that radiation therapy can provide only palliation or temporary arrest is to refuse to face the facts and use a valuable tool. This erroneous concept of the place of radiation therapy can lead only to needless suffering and death and should be exposed as the dangerous myth which it is.

2½-3 times more potent than papaverine with a longer duration of action

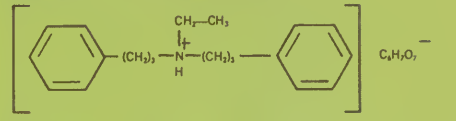
NON-NARCOTIC

SPACOLIN™

(Alverine citrate)

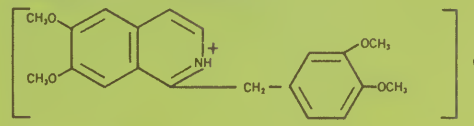
is a potent smooth muscle antispasmodic particularly effective in relieving spastic colon* and spasm of the biliary tract.

*"The diagnosis is based upon a history of catharsis or enema habit, dietary indiscretion or emotional strain, generalized or lower abdominal distress of the type described, abnormality of the bowel movement and tenderness along the course of the colon." *Cecil and Loeb, A Textbook of Medicine, Tenth Edition*

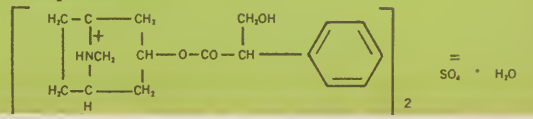


SPACOLIN™ *(Alverine citrate)*

- A specific musculotropic counter-spasmodic.
- NOT an anticholinergic, therefore, has no atropine-like side effects.
- In man, its spasmolytic effect is two and one/half to three times stronger than papaverine with a longer duration of action.
- Neurotropic effect only 1/150 that of atropine.
- Has little or no effect on normal muscle tonicity and motility.
- Specific effect on the *sphincter of Oddi.*
- Mild local anesthetic effect and decreases gastric acidity.



The chemical structures of Spacolin, Papaverine and Atropine are as follows:



Spacolin (Alverine citrate)

Papaverine Hydrochloride

Atropine Sulfate

NON-NARCOTIC

For fast relief of spasm

PRODUCT INFORMATION

Each tablet contains: Alverine citrate (Bis-gamma-phenylpropylethylamine citrate) .....120 mg.

INDICATIONS: Smooth muscle spasmolytic for use in **spastic colon,** spastic conditions of the gastrointestinal tract, biliary dyskinesia, cholecystitis, spasm associated with peptic ulcer†, cardiospasm, pylorospasm, spasm attendant to diarrhea, spastic conditions of the genitourinary tract attributable to inflammation and calculi, certain primary dysmenorrheas and as an aid in cystoscopic, esophagoscopic and gastroscopic examinations.

†Antacid and dietary measures are of primary importance in ulcer treatment and should not be neglected.

DOSAGE: One tablet after meals 1 to 3 times daily at discretion of physician. When treating spasm associated with peptic ulcer, cardiospasm or pylorospasm, administer tablets 1/2 hour before meals. In dysmenorrhea, one tablet 3 times daily starting at onset of discomfort.

PRECAUTION: Caution is recommended when using in hypotensive patients.

SIDE EFFECTS: In common with other smooth muscle depressants, Spacolin temporarily lowers blood pressure.

SUPPLIED: Bottles of 100 and 500 — 120 mg. tablets.

Alcoholism SECTION

From the Subcommittee on Alcoholism of the Medical and Chirurgical Faculty of the State of Maryland

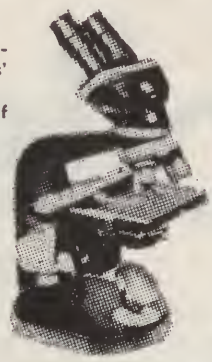
Survey of Habitual Drunkenness Offenders in Baltimore

MICHAEL BASS
and
GARY GOLDSTEIN

The Department of Mental Hygiene is again including in its capital budget request for Fiscal 1967 an item for a 200-bed rehabilitation facility for habitual drunkenness offenders, to be located on the grounds of the Crownsville State Hospital.

The need for such a facility has been noted by every committee and commission assigned to study the problem of drunkenness offenders in the past 20 years, among them the following:

1946	Governors's Commission for the Study of Chronic Alcoholism
1956	Mayor's Committee on Alcoholism
1956	Baltimore Council of Social Agencies
1961-62	Maryland Commission on Alcoholism
1962-63	Medical and Chirurgical Faculty of Maryland
1963	Mayor McKeldin's Brainstorming Conference on Alcoholism Programs
1963	Advisory Council on Mental Hygiene
1963-64	Baltimore Area and Prince George's County Councils on Alcoholism
1964-65	Mayor McKeldin's Program Committee on Alcoholism
1965	State Comprehensive Mental Health Planning Unit



Because of the dearth of accurate data on habitual offenders, the department has been unable to submit substantial justification with its request for a rehabilitation facility. To supply the needed information, the department employed the writers (University of Maryland students of psychology and law, respectively), in June, 1965, to survey the state to determine the number of habitual drunkenness offenders in each subdivision and the disposition made of them by the several courts.

According to the Annotated Code of Maryland, Article 27, Section 123, the drunkenness offender is exclusively a local responsibility. He may be fined up to $50, jailed for up to 60 days, or both. The habitual offender, one convicted of drunkenness five times within a 12-month period, may be fined up to $100, committed to either the local jail or the Maryland House of Correction for up to six months, or both. The code thus establishes the right of the local subdivision to shift to the state responsibility for the habitual offender.

Whether or not the drunkenness offender should be a responsibility of correctional and law enforcement agencies at all, either local or state, is not so clear. Nine years ago, the American Medical Association officially recognized alcoholism as a disease, a position taken also by the World Health Organization, the American Psychiatric Association, the American Hospital Association, and many other professional bodies. In 1960, Article 2C was added to the Maryland Code. Section 1 opens with the following two sentences:

> Alcoholism is hereby recognized as an illness and a public health problem affecting the general welfare and economy of the state. Alcoholism is further recognized

as an illness subject to treatment and recovery and the sufferer of alcoholism is recognized as one worthy of treatment and rehabilitation.

It may truthfully be noted that drunkenness offenders are arrested and convicted not for alcoholism, the disease, but for drunkenness, the misdemeanor; but what is the misdemeanor if not the most common symptom of the disease? And if the drunkenness offender be indeed a "sufferer of alcoholism," does not Article 2C by recognizing him as "worthy of treatment and rehabilitation," imply that he should be the responsibility of medicine and of public and private health, welfare, and rehabilitation agencies?

The question has not yet been answered in Maryland, and drunkenness offenders continue to go to jail here as in every other state in the union. The facility proposed by the Department of Mental Hygiene, by providing a treatment resource as a possible alternative to the traditional correctional resource, would implement the progressive official position partly stated and partly implied in Article 2C.

The results of the survey of Baltimore City indicate that the habitual drunkenness offenders are a large enough population to warrant a public investment in some attempt to rehabilitate them, especially when consideration is taken of the current cost of "managing" them by repeated arrests, trials, and imprisonments and by welfare support, in many cases, of the untreated alcoholics and their families.*

Baltimore City Statistics

The Baltimore City study was done under the joint auspices of the Baltimore City Health Department and the State Department of Mental Hygiene.

Information on the number and disposition of habitual drunkenness offenders in Baltimore City was collected from four sources: Auditor's Department records (1/1/64-7/1/65) for the number of drunkenness offenders who paid fines and/or court costs; Baltimore City jail commitment records for the same period; interviews with 13 municipal court judges; and Maryland House of Correction records.

Statistical results.—From January 1, 1964, to July 1, 1965, there were 11,340 convictions for drunkenness in Baltimore City municipal courts. These involved 7,176 defendants and resulting in 8,015 jail sentences.

The number of recidivists and their convictions follow:

966	convicted	2 times within 12 months
369	"	3 " " 12 "
175	"	4 " " 12 "
263	"	5 or more times within 12 months

Only six defendants were convicted as habituals and sent to the Maryland House of Correction, and an additional six not convicted as habituals were also sent there. All other jail sentences were to the Baltimore City jail. A total of 148,997 prisoner days was spent by drunkenness offenders in the Baltimore City jail during the 18-month period studied.†

Discussion

These statistics represent only a rock-bottom minimum of the number of habitual drunkenness offenders in Baltimore City. The numbers would be significantly increased, perhaps more than doubled, 1) if the charge of drunkenness were added by the arresting officer when appropriate to such other charges as disorderly conduct, vagrancy, etc.; and 2) if arresting officers routinely checked on previous arrests so as to report as habituals defendants arrested for drunkenness for the fifth time in the previous 12 months.

*According to a projection of the findings of a follow-up study of 378 alcoholic patients of Spring Grove State Hospital, Maryland's estimated 80,000 alcoholics cost the state approximately $6,000,000 per year on welfare budgets.

†Figure on total prisoner days determined by Harry E. Shelley, Coordinator of Alcoholism Programs, Baltimore City Health Department.

Announcing
EUTRON™

pargyline hydrochloride 25 mg. and methyclothiazide 5 mg.

for control of moderate to severe hypertension

Unique combination produces greater antihypertensive effect with lower doses

Eutron is the combination in a single tablet of 25 mg. Eutonyl (pargyline hydrochloride) and 5 mg. Enduron (methyclothiazide). This combination produces greater therapeutic effect than that of either component used alone. Side effects may be milder, too, as dosages are generally lower. The effective dosage is usually one tablet, once daily. Tablets are scored for greater dosage flexibility.

Each Eutron tablet contains two proven antihypertensives in the ratio shown to be most effective in most patients.

TM—TRADEMARK

New **EUTRON** extends your range of treatment in moderate to severe hypertension

A single product you can use even in the presence of congestive heart failure or edema

Eight out of 10 patients respond

In clinical trials, Eutron produced normotension or a significant reduction in blood pressure in eight out of 10 patients studied. The rationale for the product is this: Eutonyl used alone is a potent antihypertensive. Its antihypertensive action is markedly enhanced by Enduron, a potassium-sparing thiazide.[1,2,3] The combination (Eutron) thus produces greater antihypertensive effect with lower dosages of the Eutonyl component, and milder side effects may be seen.

512214

1. Torosdag, S., Schvartz, N., Fletcher, L., Fertig, H., Schwartz, M. S., Quan, R. F. B., and Bryant, J. M., Pargyline Hydrochloride as an Antihypertensive Agent With and Without A Thiazide, Am. J. Cardiol., 12:822, Dec., 1963.

2. Pollack, P. J., Pargyline Hydrochloride and Methyclothiazide Combined In The Treatment of Hypertension, Cur. Thera. Res., 7:10, Jan., 1965.

3. Bryant, J. M. et al., Antihypertensive Properties of Pargyline Hydrochloride, New Non-Hydrazine Monoamine Oxidase Inhibitor Compared with Sulphonamide Diuretics, J.A.M.A., 178; 406, Oct., 1961.

BP reductions in the recumbent and sitting positions often are nearly as great as in the standing. In clinical trials, the average *recumbent* BP reduction was 36/18 mm. Hg.

The average *standing* reduction in clinical trials was 45/22 mm. Hg. Thus the difference between the standing and recumbent readings was only 9/4 mm. Hg.

Significantly lowers blood pressure in all body positions; less likelihood of orthostatic hypotension

In clinical trials, the average reduction in standing blood pressure was 45/22 mm. Hg.; in the sitting position it was 48/20 mm. Hg.; and in the recumbent position, 36/18 mm. Hg.

Because Eutron effectively reduces blood pressure in all body positions, there is reduced likelihood of orthostatic symptoms or hypotension.

This was reflected in the relatively mild character of side effects seen in clinical trials (see below).

Smooth and gradual onset

Onset of antihypertensive action is usually quite smooth. Initial reduction of systolic and diastolic readings is usually seen within a week — maximum reduction in seven to ten days.

Less troublesome side effects may be seen; frequent improvement in "sense of well-being"

Fewer than 1% of patients studied discontinued Eutron therapy because of side effects. This is due in part to the relatively low dosage needed with the combination. Usual recommended dose is one tablet daily—that is, 25 mg. Eutonyl with 5 mg. Enduron. *This is about half the usual therapeutic dose of Eutonyl given alone.* As a consequence side effects may be milder. And, as with Eutonyl given alone, the patient may well note an increased sense of well being. This is in distinct contrast to most other antihypertensive therapy.

ABBOTT

Prescribing information for **EUTRON**

INDICATIONS: Eutron (pargyline hydrochloride and methyclothiazide) is indicated in the treatment of patients with moderate to severe hypertension, especially those with severe diastolic hypertension. It is not recommended for use in patients with mild or labile hypertension amenable to therapy with sedatives and/or thiazide diuretics alone.

CONTRAINDICATIONS: Eutron is contraindicated in patients with pheochromocytoma, advanced renal disease, paranoid schizophrenia and hyperthyroidism. Until further experience is gained it cannot be recommended for use in patients with malignant hypertension, children (under 12 years of age), or pregnant patients.

The concomitant use of the following is contraindicated: other monoamine oxidase inhibitors; parenteral forms of reserpine or guanethidine; sympathomimetic drugs; foods high in tyramine such as cheese; imipramine and amitriptyline, or similar antidepressants; methyldopa. A drug-free interval of two weeks should separate therapy and use of these agents.

WARNINGS: Pargyline hydrochloride is a monoamine oxidase inhibitor. Patients should be warned against eating cheese, and using alcohol, proprietary drugs or other medication without the knowledge of the physician. When it is necessary to administer alcohol, narcotics (notably meperidine), antihistamines, anesthetics, barbiturates and other hypnotics, sedatives, tranquilizers, or caffeine, these agents can be used cautiously at a dosage of ¼ to ⅕ the usual amount. Avoid parenteral administration where possible. Withdraw pargyline two weeks before elective surgery.

Patients should be warned about the possibility of postural orthostatic hypotension. Those with angina or other evidence of coronary disease should not increase physical activity. Pargyline may lower blood sugar. Potassium depletion is unlikely at the recommended dosage, but if it occurs, adjust dosage or withdraw or provide added natural food sources of potassium; potassium tablets should be avoided wherever possible, as bleeding or obstructive ulceration of the small bowel has been associated with their use; potassium levels should be especially watched if the patient is on digitalis or steroids, or if hepatic coma is impending.

PRECAUTIONS: When determining the antihypertensive effect of Eutron, blood pressure should be measured while the patient is *standing*. Use with caution in hyperactive or hyperexcitable persons. Such persons may show increased restlessness and agitation. Withdraw drug during acute febrile illness. Watch patients with impaired renal function for increasing drug effects or elevation of BUN and other evidence of progressive renal failure; withdraw drug if such alterations persist and progress. Pargyline has not been shown to cause damage to body organs or systems. As with all new drugs, complete blood counts, urinalyses, and liver function tests should be performed periodically. The drug should be used with caution in patients with liver dysfunction. With prolonged therapy, examine patients for change in color perception, visual fields, and fundi.

Elevated blood urea nitrogen, serum uric acid or blood sugar are possibilities attributable to the methyclothiazide in Eutron. Methyclothiazide may also reduce arterial response to pressor amines. Blood dyscrasias, including thrombocytopemia with purpura, agranulocytosis and aplastic anemia, have been seen with thiazide drugs.

SIDE EFFECTS: The use of pargyline may be associated with orthostatic hypotension. Mild constipation, slight edema, dry mouth, sweating, increased appetite, arthralgia, nausea and vomiting, headache, insomnia, difficulty in micturition, nightmares, impotence, delayed ejaculation, rash, and purpura have been encountered with pargyline. Hyperexcitability, increased neuromuscular activity (muscle twitching) and other extra-pyramidal symptoms have been reported. Drug fever is extremely rare. Congestive heart failure has been reported in a few patients with reduced cardiac reserve. Nocturia has been observed with the combination. If side effects persist, despite symptomatic therapy or reduction of the dose, discontinue the drug.

Maternal Welfare

Instructive case histories submitted by Subcommittee on Maternal Welfare

JOHN WHITRIDGE, JR., MD, chairman

Case 10—Post-cesarean Section Death

This patient was a 25-year-old para 1, whose estimated date of confinement was July 15. Her prenatal course had been uneventful, but her pregnancy progressed beyond the estimated date of confinement despite an attempt to induce labor with castor oil and quinine. On August 17, a flat plate of the abdomen revealed a face presentation. The patient was not in labor and the membranes were intact.

A decision was reached to carry out cesarean section. Accordingly, on August 18, under spinal anesthesia using pontocaine and supplemented by intravenous sodium pentothal after delivery, a classical section was done. A living 8lb 3½oz child was delivered.

Her immediate postoperative condition was excellent, and her course proceeded uneventfully until August 20. As the patient was walking to the bathroom, she suddenly fell to the floor and was pronounced dead shortly thereafter. Autopsy revealed massive emboli in both the right and left pulmonary arteries.

COMMENTS

Although pulmonary embolism can occur after normal pelvic delivery, the incidence is greater after operative delivery. Since this was considered an unnecessary cesarean section, the committee voted this a preventable death. With a para 1, with intact membranes, not in labor, the committee members saw no reason for abdominal delivery. It was assumed that the head was not deep in the pelvis and that the chances would have been excellent of spontaneous conversion of the face presentation to a normal vertex early in labor. Accordingly, the decision as to method of delivery should have been postponed until after the onset of labor.

where today's theory is tomorrow's therapy

Pediatrics

SPONSORED BY THE MARYLAND CHAPTER OF THE AMERICAN ACADEMY OF PEDIATRICS

WILLIAM STIFLER, JR., M.D., Chairman

RAY HEPNER, M.D., Editor

Neonatal Jaundice

MARTIN K. GORTEN, MD

Associate Professor
in Pediatrics and Pediatric Hematologist,
University Hospital

Detection and Management[1, 2]

1. Important to detect early because brain damage may result if jaundice is rapidly progressive and becomes severe.
2. Brain damage due to hyperbilirubinemia is preventable by exchange transfusion (repeated if necessary) regardless of its etiology.
3. Exchange transfusion is indicated if serum indirect bilirubin concentration rises 0.3mg-% per hour or more during first 48 hours of life and is apt to approximate or exceed a level of 20mg% subsequently.

Aids to Early Detection[1, 3, 4]

A. Examine the neonate for jaundice every six hours during the first two days of life.

B. Tag or separate fullterm infants less than 48 hours of age and premature infants under 96 hours of age to be observed for jaundice.

C. Proper lighting (simulating sunlight): two-bulb fluorescent fixture consisting of one deluxe cool white bulb and one standard warm white bulb.

Note: The influence of direct artificial light and light reflected from colored surfaces—yellow light masks jaundice; pink light makes everyone appear jaundice; and blue light blackens jaundice, making detection difficult.

D. Intensity of illumination: a pair of 15 watt bulbs, as under C, held 14-18 inches above baby, or three times the desirable amount of general illumination for a room by ceiling fixtures.

E. Diascopy: Blanche skin with a glass slide or a piece of polished lucite or plexiglas (12 inches long, ¼ inch thick, 1 inch wide). Between examinations, these can be cleaned with a sponge soaked with an antiseptic. "Jaundice rounds" can be made by examining the skin of forehead or cheeks of babies in rapid succession without handling the infants.

Differential Diagnosis[1, 2]

A. Hemolytic Jaundice
  1. Isoimmunization—Rh and ABO erythroblastosis fetalis are commonest.
  2. Acquired
    a. Septicemia—bacterial, viral (see B. 2)
    b. Drug induced such as vitamin K excess, sulfonamides, etc.
  3. Inherited
    a. Hereditary spherocytosis
    b. Heinz body anemia
    c. Non-spherocytic hemolytic anemia
    d. Hemoglobinopathy

B. Non-hemolytic Jaundice
  1. Icterus neonatorum
    a. Transient deficiency of glucuronic acid transferase
    b. Respiratory distress, hypoxia
    c. Maternal diabetes mellitus
    d. Prematurity
    e. Dehydration
    f. Hypothermia
  2. Infections (* denotes possibility of hemolytic component)
    a. Bacterial* (pneumonia, meningitis, etc.)
    b. Cytomegalovirus*
    c. Toxoplasmosis
    d. Syphilis*
  3. Neonatal hepatitis
  4. Inspissated bile syndrome
  5. Atresia of bile ducts
  6. Choledochal cyst
  7. Galactosemia
  8. Familial non-hemolytic jaundice
  9. Crigler-Najjar disease
  10. Large hematomas, internal hemorrhage
  11. Pyloric stenosis (especially posterior hypertrophy)
  12. Cretinism, hypothyroidism
  13. Congenital leukemia
  14. Congenital heart defect

HUMAN DEVELOPMENT

GEORGE C. CORKE

The staff at Rosewood has for many years provided the retarded with medical, educational, recreational, and vocational programs.

However, since Rosewood has become a state hospital with its vast increase in the number of patient admissions, there became a need for a more formal, structured program, designed to open the avenues of eventual return to the community.

The Human Development Department was formed in September, 1963, to fill the important parental role in the therapeutic setting, always maintaining the basic philosophy that within each resident's limits there is a potential contribution that can be made to society.

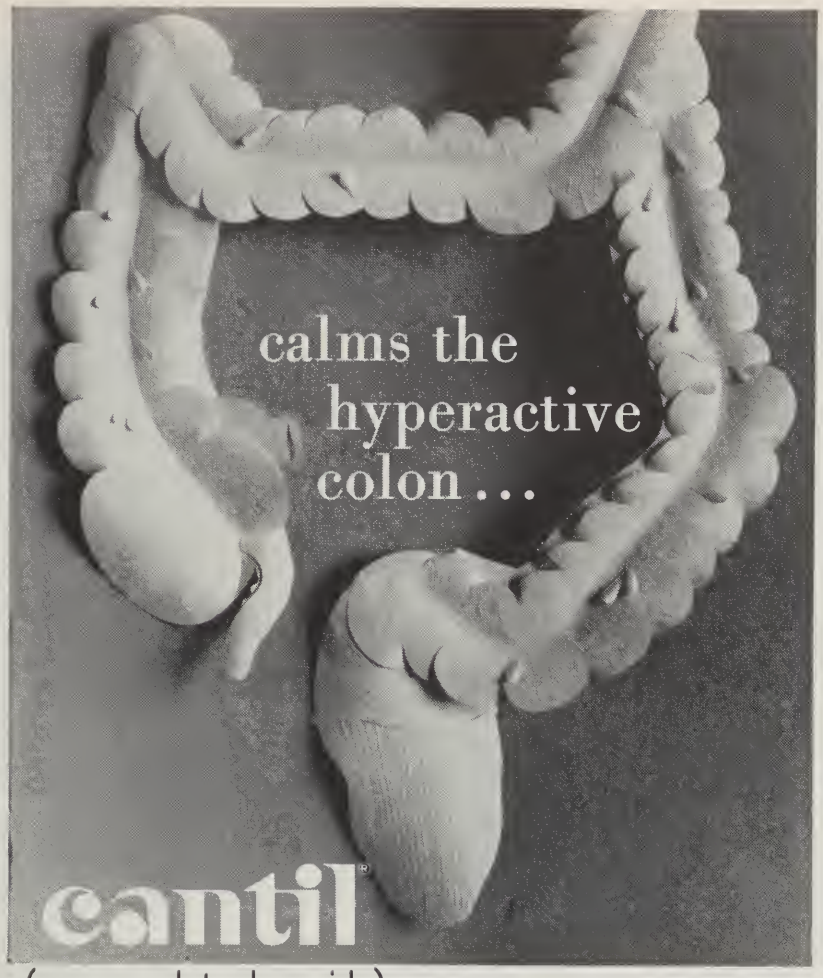
This program includes approximately 660 of the 2,500 Rosewood patients. The majority are court committed because of the inability of the home to cope with the behavior problems. They range in IQ between 50 and 70, in age from 6 to 60, and are mildly or moderately retarded with social and behavioral problems. They live in 11 separate units that house approximately 60 to 70 residents each. The staff consists of 104 psychiatric aides and licensed practical nurses, three supervisors, three cottage administrators, one registered nurse, one secretary, and one director.

Because the primary problems of these residents are neglect, inadequate social adjustment, and undesirable behavior, our program emphasizes constant training in these areas.

Each resident is trained, counselled, and guided in his daily program in personal appearance and hygiene, appropriate behavior, attitude toward authorities and other residents, willingness and ability to carry out assignments, social activities, physical development, home visits, and weekend passes.

An intimate knowledge of each resident is obtained so that all procedures may be coordinated in term of the most effective therapeutic plan for each resident.

Attendant personnel are counseled and directed in handling cottage procedures, non-medical problems, and minor disciplinary measures.



Vocational and industrial therapy programs and recreational programs, designed to further the rehabilitation process of the resident, are coordinated with the Department of Rehabilitation.

Through a system of reward and punishment, the program endeavors to remove those social and behavioral problems not acceptable to community living. Since this is a positive approach, it also implies encouragement where behavior is already satisfactory.

Patient familiarity gained by the Human Development team makes possible a more timely referral to the Social Service Department for community placement and facilitates the task of rehabilitation to a normal social environment.

The recent introduction of a highly structured program in our maximum security buildings has resulted in a vast amount of work being done at the hospital. Residents who have lived for long periods of time in a locked area are being moved to an open cottage where further training has been possible.

Reprinted from *Maryland Steps Ahead,* September, 1965 (a Department of Mental Hygiene publication).

(mepenzolate bromide)

helps restore normal motility and tone

Cantil (mepenzolate bromide) works in the colon. In irritable colon, spastic colon, ulcerative colitis and other functional and organic colonic disorders, it acts to:

- control diarrhea/constipation
- relieve spasm, cramping, bloating
- make patients more comfortable

with little effect on stomach, bladder or other viscera.

"In 40 of 44 cases of irritable or spastic colon, Cantil [mepenzolate bromide] or Cantil with Phenobarbital reduced or abolished abdominal pain, diarrhea and distention and promoted restoration of normal bowel function . . . Cantil [mepenzolate bromide] proved to be singularly free of anticholinergic side-effects. Blurring of vision or dryness of the mouth were occasionally seen and were usually managed with a reduction in dosage. Urinary retention, noted in two cases was eliminated in one by reducing dosage."[1]

IN BRIEF:

One or two tablets three times a day and one or two at bedtime usually provide prompt relief. Cantil with Phenobarbital may be prescribed if sedation is required.

Dryness of the mouth or blurring of vision may occur but it is usually mild and transitory. Urinary retention is rare. Caution should be observed in prostatic hypertrophy—withhold in glaucoma. Cantil with Phenobarbital is contraindicated in patients sensitive to phenobarbital.

Supplied: CANTIL (mepenzolate bromide)—25 mg. per scored tablet. Bottles of 100 and 250.

CANTIL with PHENOBARBITAL—containing in each scored tablet 16 mg. phenobarbital (warning: may be habit forming) and 25 mg. mepenzolate bromide. Bottles of 100 and 250.

Diabetes Detection Drive

Medical and health officials participating in planning this year's diabetes detection drive included, left to right: Dr. Marie Joy Mason, Maryland State Department of Health; Stephen Provenza, Maryland Pharmaceutical Association; Dr. Robert E. Farber, Commissioner of Health of Baltimore; Jack Redfern, Baltimore City Health Department; Dr. Samuel Morrison, president, Baltimore City Medical Society; Dr. A. A. Silver, chairman, Diabetes Subcommittee; Dr. J. Morris Reese, president-elect, Medical and Chirurgical Faculty of Maryland; Dr. Timothy Baker, president, Maryland Public Health Association; Sister Mary Dominic, president, Maryland Dietetic Association; Sister Amelia, chairman, dietetic exhibit, and Mrs. Alice Jean Anderson, dietitian.

During the three-day diabetes detection drive, November 15-17, 3,241 people visited the diabetes detection center in Baltimore for screening tests. Set up in the Fifth Regiment Armory, the diabetes detection center offered other health tests as well. Of these, 1,138 chest x-rays were taken, 1,825 vision tests were made, and 1,033 hearing tests were made.

The diabetes detection drive was sponsored by the Faculty's Subcommittee on Diabetes. Cooperating in testing activities were the Maryland Tuberculosis Association, the Maryland Society for the Prevention of Blindness, the Baltimore Hearing Society, and volunteer groups.

Other participating agencies included the Baltimore City Medical Society, the state and city health departments, the Maryland Diabetes Association, the Maryland Pharmaceutical Association, the Maryland Association of Medical Technologists, and the Maryland Association of Hospital Volunteers.

more complete relief for the "dyspeptic"

DACTILASE®

Dactilase provides comprehensive therapy for a wide range of digestive disorders. Its antispasmodic and anesthetic actions rapidly relieve pain and spasm. Dactilase decreases hypermotility without inducing stasis. In addition, it supplies digestive enzymes to help reduce bloating, belching and flatulence. Dactilase does not interfere with normal digestive secretions. Very often it can be a most useful answer to the dyspeptic's needs.

DACTILASE: Each tablet contains: Dactil® (piperidolate hydrochloride), 50 mg.; Standardized cellulolytic* enzyme, 2 mg.; Standardized amylolytic enzyme, 15 mg.; Standardized proteolytic enzyme, 10 mg.; Pancreatin 3X** (source of lipolytic activity), 100 mg.; Taurocholic acid, 15 mg.

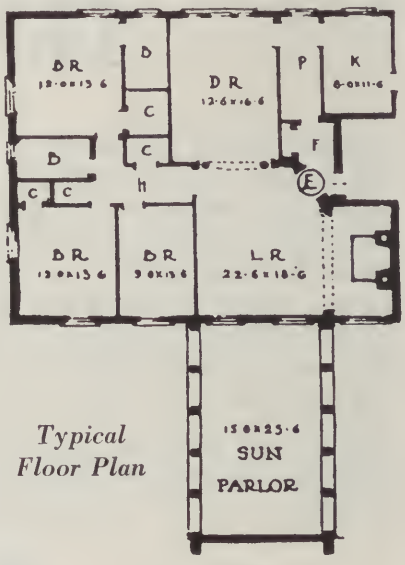
*Need in human nutrition not established. **As acid resistant granules equivalent in activity to 300 mg. Pancreatin N.F.

Side Effects and Contraindications: DACTILASE is almost entirely free of side effects. However, it should be withheld in glaucoma and in jaundice due to complete biliary obstruction.

Administration and Dosage: One tablet with, or immediately following each meal. Tablets should be swallowed whole.

Supplied: Bottles of 60 and 250.

LAKESIDE LABORATORIES, INC.
Milwaukee, Wisconsin 53201



Maryland physicians contributed $9,605 last year to the American Medical Association Education and Research Foundation. Robert vL. Campbell, MD, Faculty president, presented the check to Raymond M. McKeown, MD, president of AMA-ERF, at the AMA's clinical meeting in Philadelphia.

The Garden Apartments

IDEAL LOCATION

- Situated in one of the most beautiful and secluded spots in the Roland Park-Guilford-University Parkway section. Five units facing a terrace of well-kept lawns and shrubbery across a 180-foot court.
- Convenient to all Roland Park schools, churches and community activities. Less than two blocks from public transit.
- Easy to reach! From N. Charles St. drive west on 39th Street to Stony Run Lane, then one block right.

Typical Floor Plan

Three bedrooms, three baths; all apartments have three exposures. Living room with fireplace, full dining room, hardwood floors, porch or sun parlor. Fireproof construction of hollow tile and reinforced concrete, stucco covered walls. Luxurious comfort summer or winter.

when even southern sun fails to warm cold hands and feet

provide rapid, sustained vasodilation for warmth and relief of pain, dizziness and faintness in patients with impaired peripheral circulation

GERILIQUID warms cold hands and feet through the thermogenic action of glycine and through sustained vasodilation by glycine and niacin. In addition, in patients with impaired peripheral circulation, GERILIQUID increases the ability to walk farther with less pain. Patients particularly like the palatable, sherry wine base.

Geriliquid®

IN BRIEF: Composition: Each 5 ml. contains: niacin 75 mg. and aminoacetic acid (glycine) 750 mg. in a palatable sherry wine base; alcohol 5%.

Side Effects: Occasional lightheadedness or transient itching which may disappear with continued use. There are no known contraindications; however, caution is advised when there is concomitant administration of a coronary vasodilator.

Administration and Dosage: One or two teaspoonfuls 3 times a day before meals. If flushing is objectionable, dosage may be lowered. However, tolerance to flushing usually develops without loss of efficacy in regard to vasodilation.

Supplied: Bottles of 8 oz. and 16 oz.

DEPARTMENT OF HEALTH

STATE OF MARYLAND

William J. Peeples, MD, MPH, *Commissioner*

Highlights

REVISED REGULATIONS FOR REPORTING COMMUNICABLE DISEASES

The Medical and Chirurgical Faculty and the State Department of Health are collaborating in a campaign to promote more complete reporting of communicable diseases in Maryland, especially of venereal diseases. It was agreed that the mechanics of the system should be modified to make such reporting easier for the busy practitioner.

The revised regulations governing the reporting of communicable diseases have been approved by the Board of Health and Mental Hygiene, and reporting forms are being made available to all physicians through local and state health departments.

Changes have been made both in the list and the manner of reporting. Certain diseases will be reported by numbers instead of by name, and the mailing of reports will be facilitated by a revised card and a self-addressed, postage-paid envelope. It is hoped this new system will produce more adequate reporting of all diseases, particularly syphilis. Although effective methods for its control are readily available, syphilis continues to increase in importance as a public health problem. A solution will come only through the joint efforts of the medical professional and the health department.

PRESIDENTIAL APPOINTMENT

Maryland's Health Commissioner was one of 12 physicians appointed by President Johnson to a National Advisory Council on Regional Medical Programs. The council will advise the Surgeon General on programs created by this year's legislation on heart disease, cancer, and stroke. The council's job will be to discuss various problems of implementation nationwide and to advise the Surgeon General of possible changes required in the program. Part of the council's job will be to consider other types of diseases to see which, if any, need to be added.

HOME HEALTH SERVICES

Meetings with local officials and other interested parties in the health field are being conducted throughout the state to exchange information and ideas regarding the urgent need to develop home health services in connection with the Medicare Act. Central office staff members who will have responsibility for developing these services have participated. A filmstrip describing the Montefiore Hospital (Pittsburgh) home health services program is being used along with our other materials.

DROUGHT AFFECTS WATER SUPPLIES

Several public water supplies have been affected seriously by the continuing drought. One community, Emmitsburg, has been forced to resort to pumping water from a previously unused stream to supplement its usual sources. Because of its location, the water cannot be treated at the filtration plant. The only safeguards will be several days storage and chlorination, requiring close supervision by the Division of Sanitary Engineering. If the drought continues, this same situation may occur in several other communities and will seriously tax the ability of the state and local health departments to provide adequate supervision.

WHEN MOTHER'S IRON ISN'T UP TO MOTHERHOOD

IN BRIEF: **ACTIONS AND USES:** A single dose of Imferon (iron dextran injection) will measurably begin to raise hemoglobin and a complete course of therapy will effectively rebuild iron reserves. The drug is indicated only for specifically-diagnosed cases of iron deficiency anemia and then only when oral administration of iron is ineffective or impractical. Such iron deficiency anemia may include: patients in the last trimester of pregnancy; patients with gastrointestinal disease or those recovering from gastrointestinal surgery; patients with chronic bleeding with continual and extensive iron losses not rapidly replenishable with oral iron; patients intolerant of blood transfusion *as a source of iron;* infants with hypochromic anemia; patients who cannot be relied upon to take oral iron.

COMPOSITION: Imferon (Iron dextran injection) is a well-tolerated solution of iron dextran complex providing an equivalent of 50 mg. of elemental iron in each cc. The solution contains 0.9% sodium chloride and has a pH of 5.2-6.0. The 10 cc. vial contains 0.5% phenol as a preservative.

ADMINISTRATION AND DOSAGE: Dosage, based upon body weight and Gm. Hb./100 cc. of blood, ranges from 0.5 cc. in infants to 5.0 cc. in adults, daily, every other day, or weekly. The total iron requirement for the individual patient is readily obtainable from the dosage chart in the package insert. Deep intramuscular injection in the upper outer quadrant of the buttock, using a Z-track technique, (with displacement of the skin laterally prior to injection), insures absorption and will help avoid staining of the skin. A 2-inch needle is recommended for the adult of average size.

SIDE EFFECTS: Local and systemic side effects are few. Staining of the skin may occur. Excessive dosage, beyond the calculated need, may cause hemosiderosis. Although allergic or anaphylactoid reactions are not common, occasional severe reactions have been observed, including three fatal reactions which may have been due to Imferon (iron dextran injection). Urticaria, arthralgia, lymphadenopathy, nausea, headache, and fever have occasionally been reported. Initial test doses of 0.5 cc. are advisable.

PRECAUTIONS: If sensitivity to test doses is manifested, the drug should not be given. Imferon (iron dextran injection) must be administered by deep intramuscular injection only. Inject only in the upper outer quadrant of the buttock, not in the arm or other exposed area.

CONTRAINDICATIONS: Imferon (iron dextran injection) is contraindicated in patients sensitive to iron dextran complex. Since its use is intended for the treatment of iron deficiency anemia only, it is contraindicated in other anemias.

CARCINOGENICITY POTENTIAL: Using relatively massive doses, Imferon (iron dextran injection) has been shown to produce sarcoma in rats, mice and rabbits and possibly in hamsters, but not in guinea pigs. The risk of carcinogenesis, if any in man, following recommended therapy with Imferon (iron dextran injection) appears to be extremely small.

SUPPLIED: 2 cc. ampuls, boxes of 10; 5 cc. ampuls, boxes of 4; 10 cc. multiple dose vials.

All of the public water supplies in the state are being surveyed to determine the effect the drought has had on their operation and any plans they may have for developing additional sources. This drought, like its predecessors, appears to be having the salutary effect of stimulating the development of adequate sources.

EDUCATIONAL PROJECT FOR INDUSTRY

The Health Department's consultants in nutrition and industrial public health nursing conducted a program on prevention of heat exhaustion at a large industrial plant, in cooperation with the plant's medical, nursing, and safety personnel. Before 1961, when the program began, the incidence of heat exhaustion ranged from 150 to 225 cases each summer. After the health education program was started, the incidence dropped each year and was reduced to five cases in 1965. The nursing consultant, Division of Occupational Health of the U. S. Public Health Service, requested permission to reproduce the project report for use in her training course.

approximating the diuretic efficacy of meralluride

METAHYDRIN®

(trichlormethiazide)

To determine the relative efficacy of thiazide diuretics in congestive heart failure, Metahydrin (trichlormethiazide) and three other thiazides were measured against Mercuhydrin® (meralluride injection)—the standard diuretic. "The results leave little doubt that the diuretic efficacy, that is, the 'ceiling effect' in these terms, is not the same for different thiazides."* The assays ranged from about 40% of the effectiveness of Mercuhydrin through 67%, 77% to 90% for Metahydrin. The latter two values were thought to be significantly different from the lowest value and to be therapeutically important.

*Gold, H., *et al*: Closed Panel Conference: Present Status of the Management of Congestive Failure and Advances in Diuretic Therapy, Journal of New Drugs, 1:177, July-August, 1961.

LAKESIDE LABORATORIES, INC.
Milwaukee, Wisconsin 53201

IN BRIEF: ADMINISTRATION AND DOSAGE: One 2 mg. or 4 mg. tablet once or twice daily. In acute, severe decompensation, Mercuhydrin® (meralluride injection) may be necessary initially.

PRECAUTIONS: As with all effective diuretics, vigorous therapy may produce electrolyte depletion. Patients with severely reduced renal function should be observed carefully since thiazides may be contraindicated. Care should be taken with patients predisposed to diabetes or gout. Patients with a tendency to potassium deficiency, as in hepatic cirrhosis or diarrheal syndromes, or those under therapy with digitalis, ACTH, or certain adrenal steroids, also should be watched carefully.

SIDE EFFECTS: Nausea, flushing, constipation, skin rash, muscle cramps and gastric discomfort have been occasionally noted; rarely thrombocytopenia and bone marrow depression, photosensitivity, cholestatic jaundice, pancreatitis, perimacular edema, gout and diabetes have been caused by administration of thiazides.

CONTRAINDICATIONS: Complete renal shutdown; rising azotemia or development of hyperkalemia or acidosis in severe renal disease; demonstrated hypersensitivity.

HOW SUPPLIED: Bottles of 100 and 1000 tablets.

Learn To Do Your Part In The Prevention Of Disease

VD Darkfield Examination Service

A 24-hour Darkfield Examination Service has been instituted to assist physicians in the prompt diagnosis of infectious syphilis. This service can be obtained within minutes by calling the City Health Department at PL 2-2000, extension 2566. The new service is provided by trained public health representatives who will visit the physician's office at his request and set up a portable darkfield microscope to enable him to make a speedy diagnosis of infectious syphilis.

Under the sponsorship of the Baltimore City Health Department, these public health representatives are also making informational visits to practicing physicians in the city and distributing the latest available literature and treatment schedules for syphilis and gonorrhea.

It is imperative that every case of early syphilis be accurately diagnosed, properly treated, and rapidly reported, preferably by telephone. Rapid and accurate reporting will enable the Baltimore City Health Department to implement thorough epidemiologic follow-up after permission has been received from the reporting physician.

Only through complete physician cooperation can the forces of public health hope to effectively control the venereal diseases in the years ahead. The venereal disease control work of the Baltimore City Health Department is under the supervision of James E. Peterman, MD, director, Bureau of Communicable Diseases.

CALL PL 2-2000, Ext 2566

Suicide Study

A preliminary report of the findings on 1,320 suicides occurring among residents of Baltimore City during 1950-1963 has been made by Mr. Sidney M. Norton, director, Bureau of Vital Records, Baltimore City Health Department, and Margaret Bright, PhD, associate professor, Department of Chronic Diseases, Johns Hopkins School of Hygiene and Public Health. A summary of their findings, as reported in the *Baltimore Health News,* is as follows:

1. Of the total suicides, 825 were white males, 305 white females, 141 nonwhite males, and 49 nonwhite females.

2. The trend of the suicide death rate in Baltimore is somewhat upward; in the United States it is slightly downward. The upward trend in Baltimore is due to an increase in suicides among white females.

3. In general, the suicide rate among white people increases with age; no distinct age pattern is evident among nonwhites. Most deaths were in the 35 to 64 age group.

4. Suicides were nearly evenly distributed in the four seasons, with a tendency for more suicides to occur on Mondays. The time of day was unknown in 35% of cases.

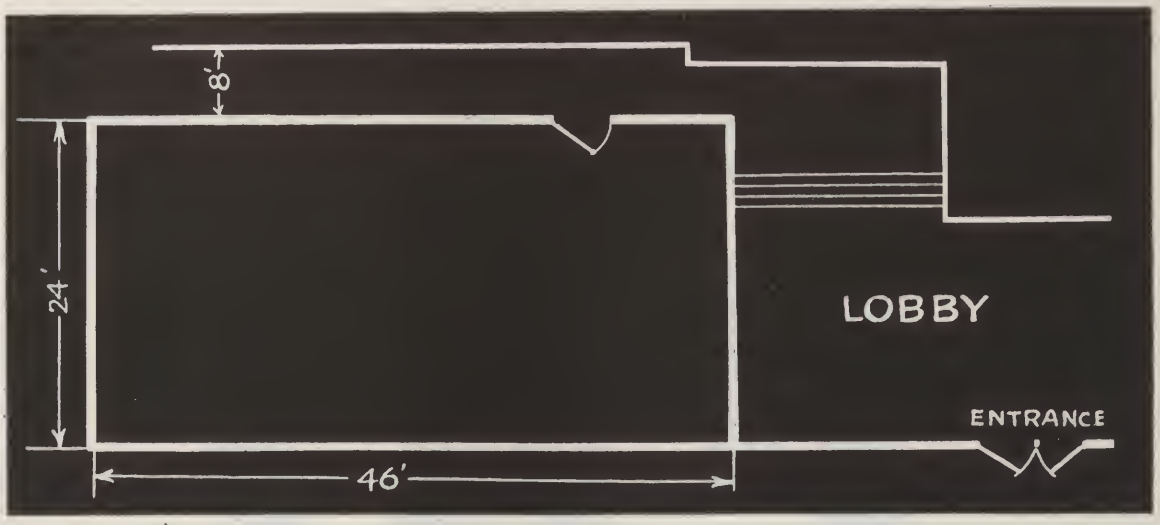
5. Most suicides took place within the confines of the city and in the individual's own home, the latter being much more the case for females.

the price of "success"

190
102

Hypertension has been called the price of success... and in some life-situations, the cost of failure. In either event, Metatensin lowers blood pressure, cushions the patient against stress and retards the progress of disease. Metatensin is effective and economical. It is well-tolerated over long periods.

THERAPY
YOU CAN STAY
WITH



METATENSIN®

EACH SCORED TABLET CONTAINS:
Metahydrin® (trichlormethiazide) 2 mg. or 4 mg. Reserpine 0.1 mg.

In Brief: Patients with hepatic cirrhosis or diarrheal syndromes, or under therapy with digitalis, ACTH, or potassium-losing steroids, should be observed for signs of hypokalemia. With thiazides, electrolyte depletion, diabetes, gout, granulopenia, nausea, pancreatitis, cholestatic jaundice, flushing, mild muscle cramps, constipation, photosensitivity, acute myopia, perimacular edema, paresthesias, neonatal bone marrow depression in infants of mothers who received thiazides during pregnancy, skin rash or purpura with or without thrombocytopenia, may occur. With reserpine, untoward effects may include depression, peptic ulcer and bronchial asthma. Withdraw medication at least 7 days prior to electroshock therapy, 2 weeks prior to elective surgery. Contraindications are complete renal shutdown, rising azotemia or development of hyperkalemia or acidosis in severe renal disease.
Supplied: Metatensin tablets, 2 mg., 4 mg. — bottles of 100 and 1000.

6. Firearms, poisoning or overdose of drugs, and hanging were the chief means of suicide; females were more likely to use poisons or drugs.

7. More suicides occurred among the widowed, separated, or divorced; occupations did not differ from the population as a whole, but laborers were over-represented among males.

8. The findings suggest that a sizable number of suicides were or recently had been under the care of a physician. One-fifth were reported as having been under psychiatric care at some time. The percentage was considerably greater among white females. Illness was mentioned in over half the cases.

9. There were few indications of "warning signals." Previous suicide attempts or threats of suicide were mentioned in only a small percentage of cases.

10. One suggestion for further research is the need to determine the extent to which a chain of events beginning with illness leads to suicide.

Robert E. Farber, MD
Commissioner of Health

a rapid lift from the hell of depression

Doré Illustration
from
Dante's Inferno

often relieves mental pain in 2-5 days

NORPRAMIN®
(desipramine hydrochloride)

Norpramin is a rapid-acting specific drug for the treatment of depression. Depressive signs and symptoms—sometimes described as "mental pain"—typically begin to improve in 2-5 days. Patients are more hopeful, less empty and less weighed down by their troubles. Norpramin has only slight sedative qualities, nevertheless anxiety *secondary to depression* is frequently relieved as depression is lifted. If anxiety or tension persists it can be controlled by adding a tranquilizer or by reducing dosage. Norpramin is not a MAO inhibitor. Side effects are usually mild.

DOSAGE AND ADMINISTRATION

Optimal results are obtained at a dosage of about 150 mg./day—two 25 mg. tablets t.i.d. After achieving optimal results, a maintenance dose (50-100 mg./day) should be sought.

LAKESIDE LABORATORIES, INC. Milwaukee, Wisconsin 53201

IN BRIEF:

Indications: In depression of any kind—neurotic and psychotic depressive reactions; manic-depressive or involutional psychotic reactions.

Contraindications and Precautions: Glaucoma, urethral or ureteral spasm, recent myocardial infarction, severe coronary heart disease and epilepsy. Should not be given within two weeks of treatment with a monoamine oxidase inhibitor. Safety in human pregnancy has not been established.

Adverse Effects: Side effects, usually mild, may include: dry mouth, constipation, dizziness, palpitation, delayed urination, "bad taste," sensory illusion, tinnitus, agitation and stimulation, sweating, drowsiness, headache, orthostatic hypotension, flushing, nausea, cramps, weakness, blurred vision and mydriasis, rash, allergy, transient eosinophilia, granulopenia, altered liver function, ataxia and extrapyramidal signs.

Supplied: Norpramin (desipramine hydrochloride) tablets of 25 mg., in bottles of 50, 500 and 1000.

STATE OF MARYLAND

Department of Mental Hygiene

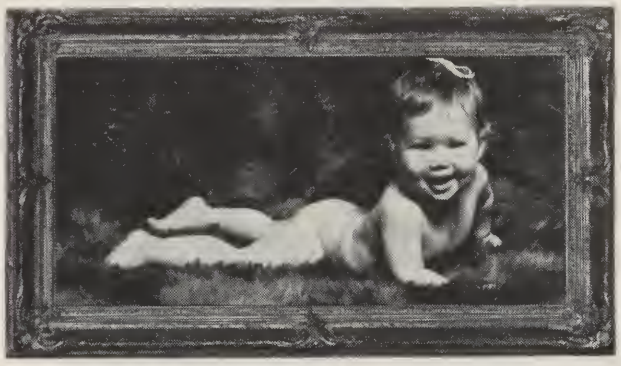
Patterns of Retention, Release, and Rehospitalization

Most recently admitted patients are released within a short period after onset of hospitalization, and most of those released do not receive additional hospital services within 18 months after their return to the community.

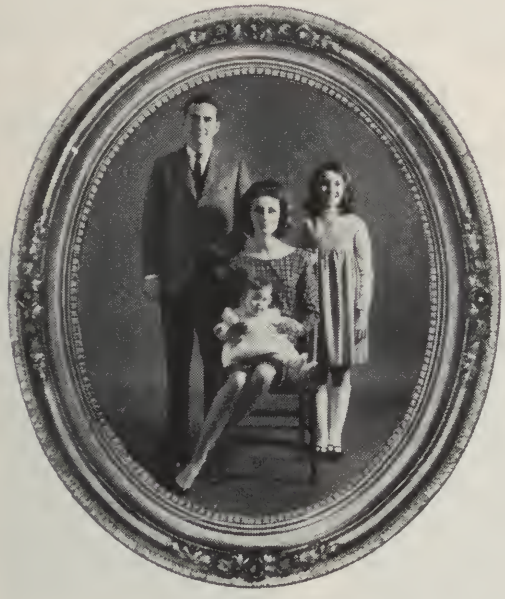
More than half of the patients in each diagnostic group were released within three months. At the end of 12 months, only 284 of the 1,984 psychotics, 35 of the 626 personality disorders, and 36 of the 1,653 alcoholics were still hospitalized. Eighteen months after admission, half of the psychotics and three-fourths of the personality disorders and alcoholics were alive and not under hospital or clinic care. At this point nine, three, and two per cent of psychotics, personality disorders, and alcoholics remained hospitalized. Roughly twice as many had been released and readmitted.

	Psychotics	Psychoneurotic and Personality Disorders	Alcoholics
Percent Released Within			
3 Months	55	79	84
6 Months	74	90	93
12 Months	85	94	97
For Those Released Within 12 Months, Percent Rehospitalized Within			
3 Months	17	15	19
12 Months	37	28	37
18 Months	45	32	42
Status 18 Months After Admission (Per Cent)			
In Hospital — Continuously	9	3	2
Readmitted	13	6	6
On Hospital Leave	14	6	5
On Clinical Rolls	15	9	3
Dead	2	2	5
Alive—not under care	47	74	79

The following data, from a recently released study,* are based on 4,263 admissions, age 25-54, to the Crownsville, Springfield, and Spring Grove Hospitals between July 1, 1961, and December 31, 1962. Of these, 1,984 were diagnosed as psychotics, 626 as psychoneurotic and personality disorders, and 1,653 as alcoholics.



These data indicate that the build-up in the number of chronic long stay hospital patients



*A Psychiatric Case Register Study Of Release And Return Rates For State Mental Hospital Patients—Presented at the annual meeting of the American Public Health Association on October 18, 1965.

Turn a bundle of colic

into a bundle of joy

COLIC, often in part a reflection of family tension, adds sleepless nights to patients' and parents' distraught days. Pediatric Piptal with Phenobarbital slows down spasm, diminishes pain and crying, improves feeding patterns . . . permits sleep and rest . . . for patient and family.

Pleasant tasting Pediatric Piptal with Phenobarbital is miscible in milk, formulas and fruit juices, and may also be administered by dropper directly on the infant's tongue. Dosage is 0.5 cc. 15 minutes before feeding; in severe cases, 1.0 cc. four times daily. High doses may occasionally cause constipation with tenesmus and, rarely, flushing without fever. Contraindicated in bowel obstruction or sensitivity to phenobarbital or anticholinergics. Available in 30 cc. dropper bottles, droppers calibrated to deliver 0.5 cc.

PEDIATRIC PIPTAL® WITH PHENOBARBITAL

each cc. contains: 6 mg. phenobarbital (warning: may be habit forming); 4 mg. Piptal® (pipenzolate bromide), and 20% alcohol in a pleasant-tasting solution.

Medical Director

is small, even for those with psychotic disorders. Should this continue, we can anticipate that the accumulation of patients hospitalized continuously for long periods of time will be exceeded by the number released or dying with a resultant gradual decline in the size of this chronic patient cohort. Further efforts to minimize chronicity depend on the application of new and improved treatment concepts and on the close coordination of all hospital and community services and facilities.

Kurt Gorwitz

She's on a diet.
She's discouraged.
She needs your help.

You can encourage her with DEXAMYL®
brand of dextroamphetamine sulfate and amobarbital

'Dexamyl' is the mood-lifting anorectic; it not only assures unexcelled control of appetite but also improves outlook.

Formula: Each 'Dexamyl' Spansule® (brand of sustained release capsule) No. 1 contains 10 mg. of Dexedrine® (brand of dextroamphetamine sulfate) and 1 gr. of amobarbital, derivative of barbituric acid [Warning, may be habit forming]. Each 'Dexamyl' *Spansule* capsule No. 2 contains 15 mg. of Dexedrine (brand of dextroamphetamine sulfate) and 1½ gr. of amobarbital [Warning, may be habit forming]. *Principal cautions and side effects:* Use with caution in patients hypersensitive to sympathomimetics or barbiturates and in coronary or cardiovascular disease or severe hypertension. Insomnia, excitability and increased motor activity are infrequent and ordinarily mild. *Before prescribing, see SK&F product Prescribing Information. Professional Business Management

Personal Versus Professional Responsibilities

WILBURN L. McCLURE, JR.

Sometimes it is easier to answer the question, "Dad, may I have several thousand dollars for a college education?" than it is to answer, "Dad, may I have several hours of your time for advice about my future?"

While this may seem irrelevant to professional business management, many factors which business advisors must keep in mind are common among physicians: 1) how the doctor can earn enough to adequately provide for the needs of himself and his family; 2) how the doctor can help guide the family future as bread winner, husband, father, and friend.

These responsibilities, while shared by people in other professions, are complicated by the demanding outside forces (such as hospital, clinics, societies) which few other professions encounter. Where to draw the line and divide the time is the crucial problem.

Take the following case as an example of the complexity of the problem:

Dr. Post's son finished high school with good grades and has recently completed his second year of college with fair grades. Fred walked into the house one evening and announced at dinner, "Dad, Mom, I joined the Marines; leave Monday a week. No sense in arguing; it's done." Shock came over both parents. Two years' money down the drain for college was one thing, but three years of his future lost to the Marine Corps was another. All the family reasoning in the world couldn't change his mind. His father finally suggested that Fred at least talk to someone of similar experience. Fred talked to a former Marine sergeant and learned that while the Marine Corps certainly offered many advantages in learning discipline and self-protection, the chances for developing a career in medicine (even at Officer's Candidate School) were slim. The Marine Corps was the worse possible choice, and after a few days of serious thinking, Fred altered his plans and is glad of it.

Need anyone tell you that there is no greater emergency than seeing to the well-planned future of your family. The economic factor, while tremendously important, is completely insignificant to the personal attention factor.

The impression should not be gained that all physicians are too busy or for other reasons reluctant to give their family adequate attention. Appraise your own situation by the following guidelines:

1. Should you recognize that you have not been giving your family adequate time and attention, MAKE THE TIME!
2. If you feel you have given enough time and attention yet your advice is not being accepted, seek the assistance of a friend completely removed from the family but one who has direct insight and experience in the immediate problem.
3. If you have given your time and attention or you have sought outside assistance yet neither is accepted, then rest assured with a clear conscience that you have done all that you can do as a parent.

Ignore any member of your family and you'll create a future stranger.

Doctor,

Here is the Abbott anorectic program designed to meet the individual needs of your overweight patients.

mood elevation

Abbott
Anorectic
Program

DESOXYN® Gradumet® (methamphetamine hydrochloride)

Smooth appetite control plus mood elevation.

The obese patient on a diet often has to battle depression as well as overweight. Desoxyn Gradumet helps the dieter in both battles by elevating the mood while it curbs the appetite. Thanks to the Gradumet, medication is smoothly released all-day from a single oral dose.

If she can't take plain amphetamine, put her on DESBUTAL® Gradumet

Calms anxieties; controls compulsive eating.

Desbutal Gradumet provides 2 drugs in 2 tablet sections, combined back to back to form a single tablet. One section contains Desoxyn to curb the appetite and lift the mood; the other contains Nembutal® (pentobarbital) to calm the patient and counteract any excessive stimulation.

Both drugs are released in an effective dosage ratio throughout the day.

controlled release

Abbott
Anorectic
Program

Not all long-release vehicles are the same. Here is why the Gradumet is different and what it means for your overweight patients.

The release action is purely physical and relies on only one factor common to every patient: gastrointestinal fluid. There is no dependence on enteric coatings, enzymes, motility, or an "ideal" ion concentration in the gastrointestinal tract.

Your patients get a measured amount of medication, moment by moment, throughout the day. They are not subjected to ups and downs of drug release . . . or to erratic release from patient to patient . . . or to erratic release in the same patient from day to day.

That's why the Gradumet provides controlled-release as well as long release.

Perhaps you saw the Gradumet model demonstration which shows that the release is entirely physical. When fluid is added, the drug in the outer ends of the channels dissolves. As fluid penetrates deeper into the channels, there is a continuous release of medication. The rate of release is rigidly controlled by the size and number of channels.

samples available

Each sample contains 6 tablets and a filled Sucaryl® Sweetener dispenser. For a supply, write Abbott Laboratories or ask your Abbott man.

economy

Patients, in many cases, save enough to get five weeks of medication for the price of four, compared to other leading long-release anorectics.

CONTRAINDICATION: Desoxyn and Desbutal are contraindicated in patients taking a monoamine oxidase inhibitor.

PRECAUTIONS: Use with caution in patients with hypertension, cardiovascular disease, hyperthyroidism, old age, or those sensitive to sympathomimetic drugs or ephedrine and its derivatives. Careful supervision is advisable with maladjusted individuals.

Louis Krause, MD, Chairman
Library and History Committee

Elizabeth Sanford
Librarian

Interlibrary Loan Service

A number of our members are unaware of the interlibrary loan program. When a member requests a book or journal article from the library, we first check our own holdings for it. If we do not own the requested material, we then attempt to locate it locally. There are several sources, including Health Sciences Library of the University of Maryland, Welch Medical Library and Phipps Psychiatric Library of Johns Hopkins University, Johns Hopkins University Library, Enoch Pratt Free Library, and various hospital libraries.

When material is not available locally, it is then requested from the National Library of Medicine (NLM) in Bethesda. The interlibrary loan service is quite prompt and free! Usually a requested book is received within two weeks. Most of our requests from NLM are for journal articles. A single photocopy of the article is sent instead of the original, usually within five to 10 days, and need not be returned. Last month we requested an article from NLM which had been published in 1772. A photocopy was received within 10 days.

There are, of course, many other sources for information. If you desire an article or a book, even though you think that our library does not own it, let us know so that we may take advantage of the interlibrary loan program.

This program works two ways. We also lend books and journals to libraries both local and out-of-state. Even the National Library of Medicine borrowed two items from us this year!

* * * * *

To continue our book review series, John D. Dumler, MD, a gynecologist, gave us his thoughts about the following book:

APPLIED HYPNOSIS AND POSITIVE SUGGESTION, by George A. Ulett, MD, and Donald B. Peterson, MD, C. V. Mosby, 1965.

This recently published, short, concise, and informative book concerning hypnotism and suggestion should be well received by all clinicians interested in those aspects of medical therapy which deal with psychosomatics. It is not comprehensive enough to delve very deeply into the numerous theories of hypnotism; it does not catalog the many oft-raised, although possibly erroneous, objections to hypnotism. It limits its scope to the more easily treated conditions of outpatients, and it barely touches upon the application of suggestibility to the surgical and obstetric fields. It does whet the appetite for more. As far as it goes, it is practical rather than theoretic. This is a virtue in that it may stimulate the practitioner to try to treat the office patient more adequately with psychotherapy. Suggestion and reassurance are wonderful tools.

The book's weakness is that it is too facile. It suggests that hypnotism is easily learned and simply applied. Most busy practitioners have not the patience to try, and their motivation is diminished by early failures.

The book serves one purpose nobly. It takes

BRING THE TREATMENT TOGETHER
IN A SINGLE PRESCRIPTION

ACHROCIDIN®

Tetracycline HCl-Antihistamine-Analgesic Compound

Each tablet contains:

ACHROMYCIN® Tetracycline HCl	125 mg	Caffeine	30 mg
Acetophenetidin (Phenacetin)	120 mg	Salicylamide	150 mg
		Chlorothen Citrate	25 mg

Effective in controlling complicating tetracycline-sensitive bacterial infection and providing symptomatic relief in allergic diseases of the upper respiratory tract. Possible side effects include drowsiness, slight gastric distress, anorexia, overgrowth of nonsusceptible organisms, tooth discoloration (if given during tooth formation), photodynamic reaction to sunlight and increased intracranial pressure (in young infants). Average adult dosage: 2 tablets four times daily, given at least one hour before, or two hours after meals. Patient should avoid direct exposure to artificial or natural sunlight; and should not drive a car or operate machinery while on drug. Reduce dosage in impaired renal function. Stop drug immediately at the first sign of adverse reaction.

The Science of Communication as practiced at Monumental Printing

It's more than a science: it's an Art, the precise transliteration in print of an intangible idea for a heterogeneous group of critical readers.

Here, at Monumental Printing, we learned to handle the tools of intelligent communication by the emperical method: working with them. The brush and palette of our art, the chisel, the score, the script are simply words on paper. We learned their proper use over 50 years of practice by being permitted to print such Journals as:

Clinical Chemistry
Digestive Diseases
Fertility & Sterility
Occupational Medicine
Leprosy
Mental Hospitals
Psychiatric Studies and Projects
Psychosomatic Medicine

We speak your language. We know the difference between edema and enema; syndrome and symptom; sewage and sewerage. And when and why we should use 12 point Caslon Bold instead of 10 point Stymie.

If you, too, need a good printer, let's communicate!

MRS. IRVING J. TAYLOR, *Auxiliary Editor*

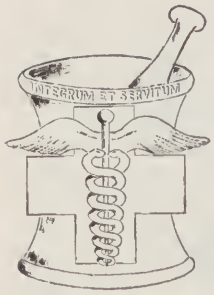
Mrs. James A. Roberts

President, Woman's Auxiliary to the Montgomery County Medical Society

Mary Adele Roberts was born in Baltimore. After graduating from the Institute of Notre Dame, she went into nurses training at Mercy Hospital. She received her RN in 1947.

While a student at Mercy Hospital, Mary Adele met James A. Roberts, an intern. They were married in 1948 and moved to Jacksonville, Fla., where he was stationed as a medical officer at the naval air station. They returned to Baltimore in 1949, where Dr. Roberts had an assistant residency in medicine at Mercy Hospital for one year and a fellowship in medicine at Johns Hopkins Hospital for two years. In July, 1952, they moved to Silver Spring, and Dr. Roberts started his practice in internal medicine.

Mrs. Roberts did private duty nursing in Baltimore and general nursing at St. Vincent's Hospital in Jacksonville. When she returned to Baltimore she worked in the operation room at Mercy.



Mary Adele was treasurer of the Woman's Auxiliary to the Montgomery County Medical Society from 1954 through 1956. She became president-elect and chairman of the AMAERF in 1964 and was installed as president on May 18, 1965. She is a member of three PTA's, the auxiliary to the Holy Cross Hospital, church organizations, and Manner Country Club Swimming Committee.

Dr. and Mrs. Roberts have seven children: Pat, 16; Bill, 14; Nancy, 12; Peggy, 9; Frank, 8; Michael, 7; and Mary Beth, 4.

Mary Adele's hobbies are swimming, golf, bowling, knitting, and sewing. She enjoys travel, and she and Dr. Roberts are looking forward to the Bermuda Cruise with the Med-Chi in April.

on the Goucher College Campus, on March 12 will be the Baltimore City auxiliary's fund-raising event this year.

The program will feature Mr. Philip Burton (foster-father and mentor of Richard) and Mr. Christian Alderson (of the original cast of "My Fair Lady") in "A Pageant of Kings." This is a dramatic historical panorama recreating the War of Roses. It will begin at 8:30 PM.

Additional attractions of the evening will be drawings for valuable prizes as well as the usual cheer baskets. After the performance, the guests will be treated to homemade pastries and coffee plus cordiality and good company. Tickets are $3 if purchased in advance or $3.50 if purchased at the door.

All doctors and their wives are invited. Please send your reservations and check to:

Mrs. S. G. Sullivan
419 Oak Lane
Baltimore, Md 21204

For any further information, call the chairman of this event:

Mrs. Harold L. Vyner, HUnter 6-3444.

SEE *YOU* THERE!

An eminent role in medical practice

- Clinicians throughout the world consider meprobamate a therapeutic standard in the management of anxiety and tension.
- The high safety-efficacy ratio of 'Miltown' has been demonstrated by more than a decade of clinical use.

Miltown® (meprobamate)

Indications: 'Miltown' (meprobamate) is effective in relief of anxiety and tension states. Also as adjunctive therapy when anxiety may be a causative or otherwise disturbing factor. Although not a hypnotic, 'Miltown' fosters normal sleep through both its antianxiety and muscle-relaxant properties.

Contraindications: Previous allergic or idiosyncratic reactions to meprobamate or meprobamate-containing drugs.

Precautions: Careful supervision of dose and amounts prescribed is advised. Consider possibility of dependence, particularly in patients with history of drug or alcohol addiction; withdraw gradually after use for weeks or months at excessive dosage. Abrupt withdrawal may precipitate recurrence of preexisting symptoms, or withdrawal reactions including, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, the dose should be reduced and operation of motor vehicles or machinery or other activity requiring alertness should be avoided if these symptoms are present. Effects of excessive alcohol may possibly be increased by meprobamate. Grand mal seizures may be precipitated in persons suffering from both grand and petit mal. Prescribe cautiously and in small quantities to patients with suicidal tendencies.

Side effects: Drowsiness may occur and, rarely, ataxia, usually controlled by decreasing the dose. Allergic or idiosyncratic reactions are rare, generally developing after one to four doses. Mild reactions are characterized by an urticarial or erythematous, maculopapular rash. Acute nonthrombocytopenic purpura with peripheral edema and fever, transient leukopenia, and a single case of fatal bullous dermatitis after administration of meprobamate and prednisolone have been reported. More severe and very rare cases of hypersensitivity may produce fever, chills, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, anaphylaxis, stomatitis and proctitis. Treatment should be symptomatic in such cases, and the drug should not be reinstituted. Isolated cases of agranulocytosis, thrombocytopenic purpura, and a single fatal instance of aplastic anemia have been reported, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity has been reported, usually after excessive meprobamate dosage. Suicidal attempts may produce lethargy, stupor, ataxia, coma, shock, vasomotor and respiratory collapse.

Usual adult dosage: One or two 400 mg. tablets three times daily. Doses above 2400 mg. daily are not recommended.

Supplied: In two strengths: 400 mg. scored tablets and 200 mg. coated tablets.

Before prescribing, consult package circular.

Book Reviews

Clinical Phonocardiography, Dennis C. Deuchar, MD, Princeton, NJ: D. Van Nostrand Co, Inc., 1965.

In the preface to this small book, the author states that his aim ". . . has been to provide for the general physician or practitioner and the student, whether post- or under-graduate, a relatively short text which will serve to familiarize him with the potentialities and current usage of the phonocardiograph." Included are sections devoted to instruments and techniques, principle abnormalities of heart sounds and murmurs, interpretation, and phonocardiographic patterns in various diseases and states.

The author has made free use of explanatory and illustrative diagrams with approximately 80 figures, including many tracings drawn and to some extent simplified. There are also eight plates or reproductions of phonocardiograms. The illustrations and text are well done. At a time when cardiac auscultation has received impetus from careful correlations with results of cardiac catheterization and other hemodynamic studies, this text fills the need for a relatively simple book, bringing to the practicing physician and student the practical advances in cardiac auscultation.

The presentation combines a well integrated text with excellent illustrations. It is recommended as one of the finer simpler texts in this area to both student and practicing physician alike.

Leonard Scherlis, MD

PRINCIPLES OF CHEST ROENTGENOLOGY, by Benjamin Felson, MD, Aaron S. Weinstein, MD, and Harold B. Spitz, MD. Saunders, 1965.

This is a programmed text designed to give the nonradiologist a basic understanding of chest roentgen interpretation. The programmed format, based on material from a more conventional text, introduces the subject simply and with a minimum expenditure of the student's time. The authors have written in a light, informal style, with bits of humor, to further ease the student's burden.

SYMPOSIUM ON FOODS: PROTEINS AND THEIR REACTIONS, edted by H. W. Schultz, PhD, and A. F. Anglemier, PhD, AVI Publishing Co., 1964. $3

The Symposia on Foods, conducted by the Department of Food Science and Technology, Oregon State University, bring together scientists engaged in research not necessarily related to foods and scientists who are conducting research on food systems. They focus on problems believed to be given too little attention. This report calls attention to the need for more knowledge of the role of foods in allergies, immunity, and the least explored aspects of nutrition.

THE UNIVERSITY OF MIAMI NEURO-OPHTHALMOLOGY SYMPOSIUM, edited by J. Lawton, MD, Thomas, 1964. $16.75

This symposium, held in 1963, makes available to the practitioner some of the newest clinical information on the subject, some of which is published in this volume for the first time. Among the subjects presented are ophthalmodynamometry, skew deviation, ischemic optic neuritis, bright plaques of Hollenhorst, and the importance of the treponema pallidum immobilization test in the diagnosis of ocular and neurosyphilis. Surgical treatment of intracranial vascular lesions, such as aneurysms and arteriovenous malformations, is thoroughly reviewed.

Among the contributors are Richard Lindenberg, MD, and Frank B. Walsh, MD, of Baltimore.

EXPERIENCE IN RENAL TRANSPLANTATION, by Thomas E. Starzl, MD, Saunders, 1964. $17

While clinical application of organ transplantation is far from perfect, the fact that four of the first six patients in this series are still well attests to the progress that has been made. The author presents a simple and practical analysis of cases treated by renal transplantation at the University of Colorado Medical Center.

CURRENT CONCEPTS IN MEDICAL PRACTICE, edited by John E. Mullins, MD. Mosby, 1965. $10.75

This book is the editor's solution to the medical literature explosion. It is an attempt to summarize recent developments without exhausting either the subject or the reader. Only common medical problems are considered here, and selections from the literature of the past two years highlight each of the subjects discussed. Each section is well documented.

RYPIN'S MEDICAL LICENSURE EXAMINATIONS, 10th ed, edited by Arthur W. Wright, MD. Lippincott, 1965. $12.50

Like its predecessors, this edition offers a compact, concise, and orderly presentation of the various fields of medicine as an aid in reviewing for licensure and other examinations. It is divided into two broad areas: Basic Medical Sciences and Clinical Sciences. All chapters have been brought up to date.

Working out of a hat?

If so, here's a bit of advice well worth putting in your thinking cap. The Lucas Design Group has a remarkable way of stretching hat-type offices into normal-type places of pleasant surroundings and squeeze-free movement. It's amazing what can be done with small offices. Space seems to just appear from nowhere. This is a special knack of the Lucas Design Group, and we frankly know of no others quite as deft at making big ones out of little ones. Have your secretary make an appointment for you, soon, with one of our designers. Call MU. 5-3000.

GLUCOLA™

Carbonated Preparation for
Carbohydrate Tolerance Tests

NEW

- **For use in glucose tolerance tests**
- **In preference to the postprandial test meal**

A NEW SOLUTION FOR AN OLD PROBLEM

Ready to use • Pleasant tasting cola flavor • Well tolerated

A 7-ounce bottle of GLUCOLA provides a liquid oral loading dose equivalent to 75 Gm. of glucose* for carbohydrate tolerance testing. GLUCOLA avoids the nausea that frequently results from lingering sweet laboratory preparations, and the occasional emesis that necessitates rescheduling the test. With GLUCOLA, no time is lost weighing and mixing glucose "cocktails"—only a bottle opener is needed.

753(R2)64

*The rapidly hydrolyzable saccharides in this formulation assure optimum absorption and glucose levels comparable to those obtained with a 100 Gm. loading dose.

Available through your regular supplier:
cartons of 12 7-oz bottles (6 bottles per pack, 2 packs per carton).

Ames Company, Inc.
Elkhart, Indiana

AMES

The Somatic Mask: chest pain

heart disease or psychic tension?

"Heart symptoms"—chest pain, tachycardia, arrhythmia—invariably alarm and preoccupy the patient, though they may be completely without organic basis. Such symptoms often are somatic masks of psychic tension, arising from constant encounters with stressful situations.

When the problem is diagnosed as emotionally produced, consider Valium (diazepam) as adjunctive therapy. Valium (diazepam) acts rapidly to calm the patient, to reduce his psychic tension and relieve associated cardiovascular complaints.

Neurotic fatigue—the chronic tiredness resulting from emotional strain which so often accompanies psychogenic "heart" symptoms—also can be controlled by this highly useful agent. Valium (diazepam) often achieves results where other psychotherapeutic agents have failed.

Valium (diazepam) is generally well tolerated, and usually does not impair mental acuity or ability to function. If side effects such as ataxia and drowsiness occur, they usually disappear with dosage adjustment.

Valium® (diazepam)

2-mg, 5-mg, 10-mg tablets

In prescribing: Dosage—Adults: Mild to moderate psychoneurotic reactions, 2 to 5 mg b.i.d. or t.i.d.; severe psychoneurotic reactions, 5 to 10 mg t.i.d. or q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hrs, then 5 mg t.i.d. or q.i.d. as needed; muscle spasm with cerebral palsy or athetosis, 2 to 10 mg t.i.d. or q.i.d. Geriatric patients: 1 or 2 mg/day initially, increase gradually as needed.

Contraindications: Infants, patients with history of convulsive disorders or glaucoma.

Warning: Not of value in the treatment of psychotic patients, and should not be employed in lieu of appropriate treatment.

Precautions: Limit dosage to smallest effective amount in elderly patients (not more than 1 mg, one or two times daily) to preclude ataxia or oversedation. Advise patients against possibly hazardous procedures until correct maintenance dosage is established; driving during therapy not recommended. In general, concurrent use with other psychotropic agents is not recommended. Warn patients of possible combined effects with alcohol. Safe use in pregnancy not established. Observe usual precautions in impaired renal or hepatic function and in patients who may be suicidal; periodic blood counts and liver function tests advisable in long-term use. Cease therapy gradually.

Side Effects: Side effects (usually dose-related) are fatigue, drowsiness and ataxia. Also reported: mild nausea, dizziness, blurred vision, diplopia, headache, incontinence, slurred speech, tremor and skin rash; paradoxical reactions (excitement, depression, stimulation, sleep disturbances and hallucinations) and changes in EEG patterns. Abrupt cessation after prolonged overdosage may produce withdrawal symptoms similar to those seen with barbiturates, meprobamate and chlordiazepoxide HCl.

Supplied: Tablets, 2 mg, 5 mg and 10 mg; bottles of 50 for convenience and economy in prescribing.

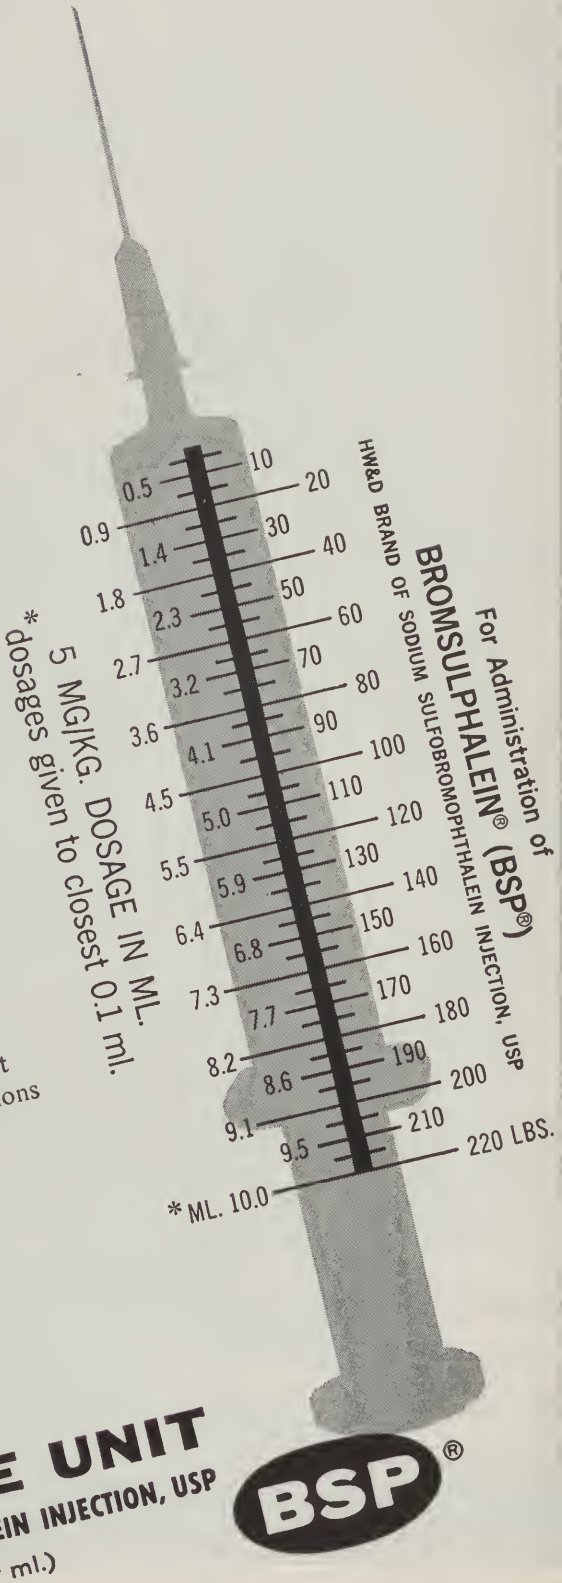
A RELIABLE, PROVEN PRODUCT . . .

The BSP test, introduced in 1925, remains one of the most sensitive laboratory procedures available for determining hepatic function.



A STERILE, CONVENIENT PUT-UP . . .

Each BSP Disposable Unit contains: a sterile, glass, disposable syringe with the 5 mg./kg. BSP dosage schedule imprinted on the barrel, a sterile needle, alcohol swab and a 7.5 ml. or 10 ml. size ampule of Bromsulphalein.

The BSP unit is designed for maximum patient protection. The precalibrated syringe makes weight calculations unnecessary and provides for proper dosage regardless of patient-weight.

ECONOMICALLY PACKAGED . . .

Prepared for economic unit dispensing, this completely disposable put-up affords a savings in time and labor—the most costly commodities.

Neo-Synephrine is a standard among topical vasoconstrictors. It is unsurpassed for reducing nasal turgescence in colds; and a most valuable aid in preventing and treating sinusitis.

Neo-Synephrine stops the boggy feeling of colds at once—works against factors that induce sinusitis. With Neo-Synephrine nose drops, spray or jelly, turbinates shrink on contact, obstructed ostia open and drainage is re-established.

In sinusitis, Neo-Synephrine helps to promote drainage and hasten recovery.* Used promptly, it helps clear the stagnant sinus and lessen the chances of chronicity.

Neo-Synephrine HCl is available in:
⅛% solution for infants
¼% solution for children and adults
¼% pediatric nasal spray for children
½% solution for adults
½% nasal spray for adults
½% jelly for children and adults
1% solution for adults (resistant cases)

Now A Check Every Month Geared to Your Income Needs

Exclusive Baltimore Federal MONI* Plan Brings Monthly Check in Any Desired Amount

For consolidation of investments or retirement income, you owe it to yourself to look into the advantages of this effective, proven investment plan. The new Baltimore Federal MONI Plan provides a way for you to schedule a planned income over any period of time (even for life), in any amount. And your invested funds earn liberal dividends to contribute extra income in complete safety.

You retain full control of your investment. You can stop, reduce, or increase the program at any time. There are two plans . . . a *Term* Plan and a *Permanent* Plan, tailored to fit your needs. And your capital is instantly available, in whole or part, should you require extra funds.

*MONI Plan © 1964

Investigate this profitable, controllable, income-producing plan now. Find out how easily you can plan your investment to yield a predictable, regular return and still have your capital readily available. For a detailed brochure, mail the coupon or phone MU 5-7000 and ask for the MONI Plan Officer. There is no obligation, of course.

BRING THE TREATMENT TOGETHER
IN A SINGLE PRESCRIPTION

ACHROCIDIN®

Tetracycline HCl-Antihistamine-Analgesic Compound

Each tablet contains:			
ACHROMYCIN® Tetracycline HCl	125 mg	Caffeine	30 mg
Acetophenetidin (Phenacetin)	120 mg	Salicylamide	150 mg
		Chlorothen Citrate	25 mg

Effective in controlling complicating tetracycline-sensitive bacterial infection and providing symptomatic relief in allergic diseases of the upper respiratory tract. Possible side effects include drowsiness, slight gastric distress, anorexia, overgrowth of nonsusceptible organisms, tooth discoloration (if given during tooth formation), photodynamic reaction to sunlight and increased intracranial pressure (in young infants). Average adult dosage: 2 tablets four times daily, given at least one hour before, or two hours after meals. Patient should avoid direct exposure to artificial or natural sunlight; and should not drive a car or operate machinery while on drug. Reduce dosage in impaired renal function. Stop drug immediately at the first sign of adverse reaction.

April 4—8 PM—Sinai Hospital, Baltimore

HEART ASSOCIATION OF MARYLAND

Cardiovascular Forum: "Peripheral and Cerebral Arterial Insufficiency."

April 4-8—Roanoke, Va

GILL MEMORIAL EYE, EAR AND THROAT HOSPITAL

Thirty-ninth annual spring congress in aphthalmology and otolaryngology. For further information, write: Superintendent, Post Office Box 1789, Roanoke, Va.

April 5—7:30 PM—1211 Cathedral St., Baltimore

MARYLAND SOCIETY OF ANESTHESIOLOGISTS

Business meeting.

April 13—Sheraton Belvedere Hotel

BALTIMORE CITY DENTAL SOCIETY

"The Philosophy and Rationale of Replacement Dentistry."
3 PM—Dr. Louis Fox
6 PM—Cocktails and dinner
7 PM—Dr. Harry Levin, president, Maryland State Dental Assaciation
7:30 PM—Dr. Louis Fox

April 14—8:30 PM—1211 Cathedral St., Baltimore

MARYLAND PSYCHIATRIC SOCIETY

"The Promise and Limitations of Group Therapy," James Mann, MD, director, resident training; professor of psychiatry, Boston University School of Medicine. Discussant: Theodore M. Feldberg, MD.

April 13-16—White Sulphur Springs, WVo

W. VA. ACADEMY OF OPHTHALMOLOGY AND OTOLARYNGOLOGY

Nineteenth annual meeting, to be held at The Greenbrier. For further information write to J. Elliott Blaydes, Jr., MD, Secretary-Treasurer, 107 Federal Street, Bluefield, W. Va.

April 14—Frederick County

FREDERICK COUNTY HEART ASSOCIATION

Nurses symposium.

April 21—Frederick County

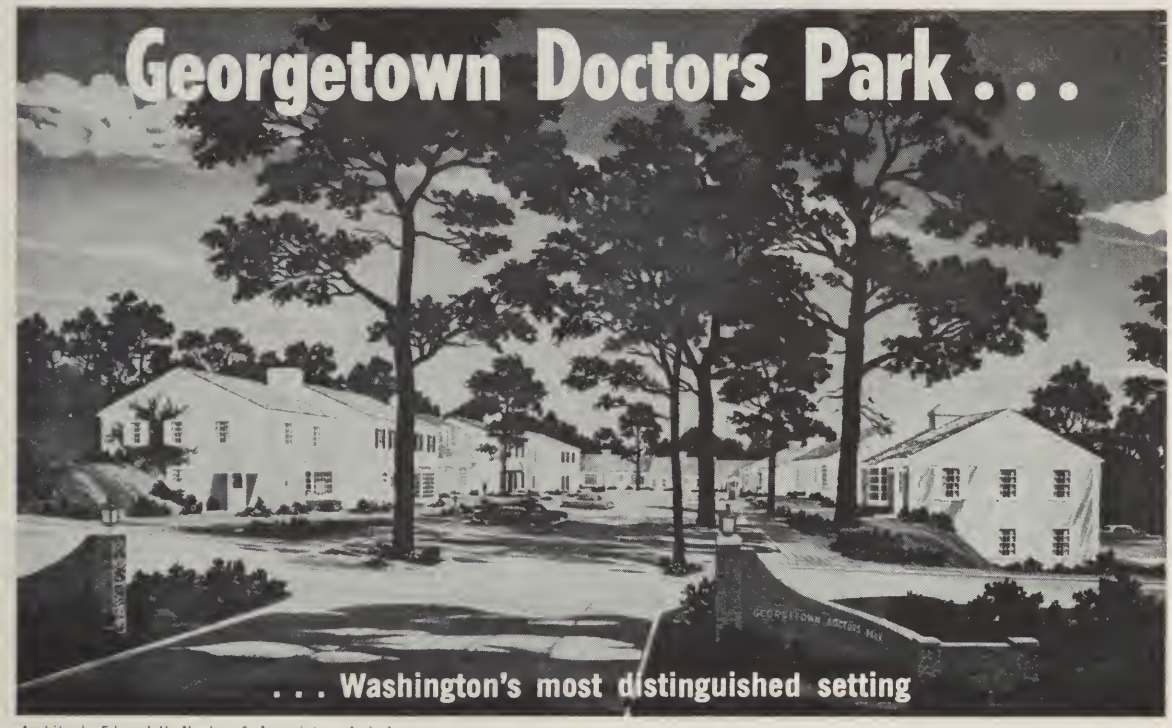
Medical workshop.

April 15

HEART ASSOCIATION OF THE LOWER EASTERN SHORE

Teaching sessions for physicians: "Arrythmias," Henry J. Marriott, MD.

April 18—8 PM—1211 Cathedral St., Baltimore



PATHOLOGY SECTION BCMS

Talk followed by presentation of cases, William H. Hartmann, MD, moderator.

April 19—5:30 PM—Sheraton-Baltimore Inn

MARYLAND RADIOLOGICAL SOCIETY

Dinner meeting ond residents' papers.

Architect: Edward H. Noakes & Associates, A. I. A.

Here is a superb setting for the medical man who knows the importance of environment for his office location. In the heart of suburban Bethesda's medical research complex, Georgetown Doctor's Park features office suites of approximately 600, 900, 1200, and 1500 square feet specifically designed for doctors or dentists. Patients may park just steps from your ground level entrance.

- Immediate occupancy
- Sound conditioning
- Charmingly designed colonial facades
- Individually controlled air conditioning and heating
- Tree-studded setting
- Private entrance to each suite
- Directly across from the National Institute of Health and two minutes from Suburban Hospital
- Less than one mile from Beltway

Your MEDICAL FACULTY at Work

JOHN SARGEANT — EXECUTIVE SECRETARY

EXECUTIVE COMMITTEE, JANUARY 6

1. Appointment of A. Gibson Packard, MD, to the Advisory Committee to Maryland Statewide Study on Vocational Rehabilitation was approved.

2. An increase in the Board of Medical Examiner's rental charge for Osler Hall, for use during examinations, was approved effective with the 1967 budget.

3. The Committee on Postgraduate Education, Preventive Medicine, and Public Health was designated to work with the State Health Department in defining "areas of need," under Senate Bill 667 (providing scholarships to medical students who agree to practice general medicine in areas of need for a period equal to the years of scholarship.)

4. The Liaison Committee was designated to meet with the State Health Department in connection with regulations defining who should qualify for free laboratory services from the Health Department.

5. The following policy was adopted for dues checks which are received without payment of the assessment: First, a letter is to be written advising the physician that the dues check cannot be processed until the $50 assessment is received. In 10 days, if no check or reply is forthcoming, the dues check is to be returned to the physician with a letter advising that failure to pay dues and assessments will result in loss of privileges and eventual suspension from membership, in accord with the procedure spelled out in the Bylaws. A copy of this letter is to be sent to the physician's component society.

6. The Executive Committee considered various recommendations of the Legislative Committee and will recommend to the Council that the Faculty take the following position on forthcoming legislative proposals:

1) Oppose nurse-midwife legislation, as this would give to such practitioners hospital privileges which are denied to qualified medical personnel
2) Support changes in the physical therapy law which would a) exempt from licensure those persons engaged in an approved course of instruction, and b) increase the membership on the Board of Physical Therapy Examiners to include five physicians and two licensed physical therapists, all to be appointed by the Governor from a list submitted by the Faculty
3) Oppose the principle of license exemption for dentists, veterinarians, and others when performing medical acts in times of emergency, as this privilege already exists
4) Support and introduce amendments to battered child legislation as proposed by the Subcommittee on Child Welfare and agreed to by other interested groups
5) Oppose premarital STS law
6) Support proposed rewritten Nurse Practice Act

An eminent role in medical practice

- Clinicians throughout the world consider meprobamate a therapeutic standard in the management of anxiety and tension.
- The high safety-efficacy ratio of 'Miltown' has been demonstrated by more than a decade of clinical use.

Miltown® (meprobamate)

Indications: 'Miltown' (meprobamate) is effective in relief of anxiety and tension states. Also as adjunctive therapy when anxiety may be a causative or otherwise disturbing factor. Although not a hypnotic, 'Miltown' fosters normal sleep through both its anti-anxiety and muscle-relaxant properties.

Contraindications: Previous allergic or idiosyncratic reactions to meprobamate or meprobamate-containing drugs.

Precautions: Careful supervision of dose and amounts prescribed is advised. Consider possibility of dependence, particularly in patients with history of drug or alcohol addiction; withdraw gradually after use for weeks or months at excessive dosage. Abrupt withdrawal may precipitate recurrence of pre-existing symptoms, or withdrawal reactions including, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, the dose should be reduced and operation of motor vehicles or machinery or other activity requiring alertness should be avoided if these symptoms are present. Effects of excessive alcohol may possibly be increased by meprobamate. Grand mal seizures may be precipitated in persons suffering from both grand and petit mal. Prescribe cautiously and in small quantities to patients with suicidal tendencies.

Side effects: Drowsiness may occur and, rarely, ataxia, usually controlled by decreasing the dose. Allergic or idiosyncratic reactions are rare, generally developing after one to four doses. Mild reactions are characterized by an urticarial or erythematous, maculopapular rash. Acute nonthrombocytopenic purpura with peripheral edema and fever, transient leukopenia, and a single case of fatal bullous dermatitis after administration of meprobamate and prednisolone have been reported. More severe and very rare cases of hypersensitivity may produce fever, chills, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, anaphylaxis, stomatitis and proctitis. Treatment should be symptomatic in such cases, and the drug should not be reinstituted. Isolated cases of agranulocytosis, thrombocytopenic purpura, and a single fatal instance of aplastic anemia have been reported, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity has been reported, usually after excessive meprobamate dosage. Suicidal attempts may produce lethargy, stupor, ataxia, coma, shock, vasomotor and respiratory collapse.

Usual adult dosage: One or two 400 mg. tablets three times daily. Doses above 2400 mg. daily are not recommended.

Supplied: In two strengths: 400 mg. scored tablets and 200 mg. coated tablets.

Before prescribing, consult package circular.

Why do more Maryland Doctors insure with The St. Paul?

Probably because our Professional Liability coverage is so thorough.

Really broad coverage. Fewer exclusions, so interpretations are no problem. The price is likely to be nice, too.

To get the folder that tells all about it concisely, write.

The St. Paul is the approved carrier for the State Medical Association here... and in more states than any other single insurance company. It must be something we offer!

Want to see just 1 insurance man and still be fully insured? Use our St. Paul Multicover Plan. Same agent as for Liability. He's in the Yellow Pages.

EXECUTIVE SECRETARY'S NEWSLETTER

March, 1966

ESOLUTIONS INTRODUCED

Resolutions to be considered at the Annual Meeting of the Medical and Chirurgical Faculty on Friday, April 29, include:

1A/66 - Endorsing Policy of Separating Professional Fees from Hospital Charges

2A/66 - Urging Establishment of a Formal School of Medical Technology at the University of Maryland in a manner analogous to that of the Schools of Medicine, Dentistry and Pharmacy; and Urging the State Legislature to appropriate a minimum of $50,000 to establish it; and to provide that it award the B.S. degree.

Copies are available to Faculty members through the Faculty office.

EFERENCE COMMITTEE

The Reference Committee meeting is scheduled for

THURSDAY, MARCH 31, at 8:00 p.m.

in the Faculty Building, in order to hear interested parties comment on the above resolutions.

All Faculty members are urged to attend and express their opinions on these matters.

ERSONALITIES

Byron G. Brogdon, M.D., Baltimore, has been named a Fellow of the American College of Radiology.

Chin-Hsin Lin, M.D., Baltimore and Arthur Peschin, M.D., Potomac have been certified as Fellows of the American College of Anesthesiologists.

ELCOME BACK

We are pleased to welcome back The Upjohn Company as an advertiser in the Maryland State Medical Journal. We also welcome two new advertisers: Pitman-Moore and Walker Laboratories.

HOTEL RESERVATIONS

The Sheraton-Belvedere Hotel has a block of 50 sleeping rooms set aside for those who are attending the Annual Faculty meeting, April 27-29, 1966. As these accommodations will be at a premium during this period, members are urged to obtain their reservations early.

BERMUDA CRUISE

The cabins remaining on board the SS Argentina, sailing from Baltimore, April 29, 1966, from the Dundalk Marine Terminal, are fast disappearing. For those who wish to participate in this five-day cruise to Bermuda and return, contact should be made immediately to:

Travel Guide Agency
416 N. Charles Street
Baltimore, Maryland 21201
Phone: SA 7-0682

COUNCIL AND HOUSE MEETINGS

An alert for now. The House of Delegates will meet in session on

TUESDAY EVENING, APRIL 26, 1966, at 8:00 p.m.

and again on

FRIDAY MORNING, APRIL 29, 1966, at 9:30 a.m.

both at the Faculty Building. This change in schedule is made so as to leave ample time for members to sail Friday afternoon to Bermuda.

A gala cocktail party is being given aboard ship, courtesy Moore-McCormack Lines and Travel Guide Agency, starting at 1:30 p.m. on Friday. All members are cordially invited to attend.

The Council will meet immediately before the Tuesday night session; and immediately following the Friday morning session.

NEWS NOTES

Wilmer K. Gallager, Jr., M.D., Baltimore, has been certified by the American Board of Internal Medicine.

John Sargent

Executive Secretary

DOCTORS, ask for a demonstration of MERCANTILE-MEDAC . . .

- The best system of medical bookkeeping by computer.
- A complete service backed by this bank's 100 years experience.
- The service that provides doctors with important advantages.

Mercantile-Medac saves doctors' valuable time. It cuts billing and bookkeeping costs, assures accuracy and speeds collections.

It will take only a few minutes for your secretary to learn to operate the compact IBM desk transmitter, which feeds billing and record keeping information to our data processing center . . . And she will be able to transmit an average of 60 transactions in just 15 minutes! After that, Mercantile-Medac does *all* of your bookkeeping and billing, and you get many extra advantages, such as accurate daily, monthly and annual statements for you and your accountant to use as a continuing analysis of your financial progress.

You owe it to yourself to see how Mercantile-Medac works . . . how it can work for *you*. We will be happy to arrange for a demonstration of Mercantile-Medac in your office or in our Computer Services Department, if you prefer.

A Key Site of Action of the Protoveratrine A in Salutensin

"The main function of the carotid sinus is regulation of the blood pressure...."[1]

The veratrum component of Salutensin acts here (and in the myocardium), initiating "...a reflex fall in blood pressure through a generalized vasodilation and fall in heart rate."[2]

SCHWENK

This is a logical Blood Pressure Regulator

ECAUSE
T ENHANCES
HE BODY'S OWN
IECHANISMS
OR REDUCING
LOOD PRESSURE

n mild
o moderate hypertension:

alutensin enhances the body's own
ıechanisms for lowering blood
ressure. The veratrum component
f Salutensin acts on the carotid
nus and myocardial receptors,
ıitiating "...a reflex fall in blood
ressure through a generalized
asodilation and fall in heart rate."[2]
o achieve this reflex modification
f hypertension, Salutensin
tilizes protoveratrine A.
n addition, to facilitate and
ıaintain blood pressure reduction,
alutensin incorporates reserpine
nd a highly effective thiazide.
n general, side effects have been reported infrequently but may include those listed in the therapeutic summary.

Simple dosage—low-cost therapy: Many patients on Salutensin respond to 1 tablet *b.i.d.* Long-term economy is assured, since dosage can frequently be lowered after initial control is established.

Available: Prescription-size bottles of 60 tablets.

References: 1. Editorial: JAMA *191*:592 (Feb. 15) 1965. 2. Meilman, E., in Moyer, J.H.: Hypertension, Philadelphia, W.B. Saunders Company, 1959, p. 395.

BRISTOL THERAPEUTIC SUMMARY
For complete information consult Official Package Circular.
Indications: Essential hypertension.
Warnings: Small-bowel lesions (obstruction, hemorrhage, perforation) have occurred during therapy with enteric-coated formulations containing potassium, with or without thiazides. Such potassium formulations should be used with Salutensin only when indicated and should be discontinued immediately if abdominal pain, distention, nausea, vomiting or gastrointestinal bleeding occurs.
Contraindications: Salutensin is contraindicated in severe depression.
Precautions: Azotemia, hypochloremia, hyponatremia, hypochloremic alkalosis and hypokalemia (especially with hepatic cirrhosis and corticosteroid therapy) may occur, particularly with pre-existing vomiting and diarrhea. Potassium loss, which may cause digitalis intoxication, responds to potassium-rich foods, potassium chloride or, if necessary, stopping therapy. Serum ammonia elevation may precipitate coma in precomatose hepatic cirrhotics. Discontinue therapy two weeks before surgery or if myocardial irritability, progressive azotemia or severe depression occur. Exercise caution with patients with peptic ulcers or renal insufficiency (if severe, Salutensin is contraindicated).
Side Effects: Hydroflumethiazide: Purpura plus or minus thrombocytopenia, hyperuricemia, leukopenia, hyperglycemia, glycosuria, malaise, weakness, dizziness, fatigue, paresthesias, muscle cramps, skin rash, epigastric distress, vomiting, diarrhea and constipation. *Reserpine:* Depression, peptic ulceration, diarrhea, Parkinsonism, nasal stuffiness, dryness of the mouth and, with overdosage, agitation, insomnia and nightmares. *Protoveratrine A:* Nausea, vomiting, cardiac arrhythmia, prostration, excessive hypotension and bradycardia. (Treat bradycardia with atropine and hypotension with vasopressors.)
Usual Dose: 1 tablet *b.i.d.*

BRISTOL LABORATORIES
Division of Bristol-Myers Co.
Syracuse, New York

Salutensin®

Each tablet contains:
protoveratrine A, 0.2 mg.;
hydroflumethiazide, 50 mg.;
reserpine, 0.125 mg.

Low host resistance?

Consider the "extra" antibacterial activity of Ilosone®

Occasionally, therapeutic failure is due to the patient's inability to mobilize his defenses sufficiently to overcome infection. Typical of this is the debilitated patient, the premature infant, or the diabetic. It is in these patients that the high levels of antimicrobial activity of Ilosone are especially useful. Ilosone has demonstrated antibacterial levels two to four times those of erythromycin base or stearate. Furthermore, it attains them earlier and maintains them longer. Even the presence of food does not appear to affect the activity of Ilosone.

Contraindications: Ilosone is contraindicated in patients with a known history of sensitivity to this drug and in those with preexisting liver disease or dysfunction.

Side-Effects: Even though Ilosone is the most active oral form of erythromycin, the incidence of side-effects is low. Infrequent cases of drug idiosyncrasy, manifested by a form of intrahepatic cholestatic jaundice, have been reported. There have been no known fatal or definite residual effects. Gastro-intestinal disturbances not associated with hepatic effects are observed in a small proportion of patients as a result of a local stimulating action of Ilosone on the alimentary tract. Although allergic manifestations are uncommon with the use of erythromycin, there have been occasional reports of urticaria, skin eruptions, and, on rare occasions, anaphylaxis.

Dosage: *Children under 25 pounds*—5 mg. per pound of body weight every six hours. *Children 25 to 50 pounds*—125 mg. every six hours. *Adults and children over 50 pounds*—250 mg. every six hours. For severe infections, these dosages may be doubled.

Available in Pulvules®, suspension, drops, and chewable tablets. Ilosone Chewable tablets should be chewed or crushed and swallowed with water.

Ilosone®

Erythromycin Estolate

The Mores of Medical Practice

Disagreeable, disgusting, disappointing, disenchanting and disheartening situations

The worst sin towards our fellow creatures is not to hate them, but to be indifferent to them: that's the essence of inhumanity.

—George Bernard Shaw

JOHN H. HIRSCHFELD, MD

Quoted from the *News American,* Louis Azrael's column of October 8, 1965:

A Lady-on-the-Phone said . . . "I'm an alcoholic and I need a doctor. I don't want to go to a public clinic. And I can well afford to pay a doctor. I called Alcoholics Anonymous and asked if they could recommend one. They said they don't do that. I called the Baltimore Council on Alcoholism. They also refused to recommend anyone. I called Johns Hopkins Hospital. They told me to go to my family doctor. But I haven't got a family doctor because I haven't been in Baltimore long, and, fortunately, have had no other illness. So what am I supposed to do. You'd think that with so much publicity about the need to help alcoholics, somebody ought to tell an alcoholic where there's a doctor who can deal with the problem."

This column was answered a few days later and is cited here:

Dear Mr. Azrael:

I read your column of Friday, October 8, 1965, wherein you quoted a lady alcoholic who had called you on the telephone stating that she wanted a doctor to help her with her illness.

Since three days before a Mrs. J. called me and related practically the same story, and then claimed to have been referred by you to the Medical and Chirurgical Faculty (LE. 9-0872). I firmly believe that this is the same lady with whom I had a long and animated conversation. She bitterly complained that she had fruitlessly called 14 different agencies, and asked personal questions of this physician, trying to assure herself of my full sympathy. After reassuring her of my full understanding of her problem, telling her that I would give her all the time and patience I could, provided she was sincerely motivated to stop drinking, and giving her a definite appointment on my next office day, this anxious lady never kept her appointment, nor did she bother cancelling same.

So, as you can clearly see, many of these alcoholics must "project" their inadequacy and frustrations into obvious hostility, criticizing such noble organizations as the Baltimore Area Council on Alcoholism, Alcoholics Anonymous, and hospitals and physicians as a group. It is hard enough to keep up with the demands of daily medical practice and tightly scheduled office hours. Therefore, it is understandable that many people in the medical and hospital field become quite perturbed by the difficulty

in handling and satisfying alcoholics, their demands and whims. As a whole, however, both the medical profession and the hospital administrators are progressively developing a more patient and more generous attitude towards the alcoholic, and we certainly don't wish to stereotype them, rather take them each as individuals on their own merits. Unfortunately, no hospital and no physician is ubiquitous enough to satisfy every patient, or to cure every illness, and we are far from perfect in being able to cope with every alcoholic.

If the complainant alcoholic felt frustrated in her inability to easily secure private medical help, the frustration is multiplied for those few members of the profession who have been entrusted by the Medical and Chirurgical Faculty to implement the AMA policy that alcoholism is a disease. For the past two years, free lectures to the medical and house staffs of all Baltimore area hospitals have been offered repeatedly in letters and flyers to the directors of medical education and the chiefs of the medical staffs. During Alcoholism Week, early in December, an afternoon was devoted to a professional seminar on alcoholism at the Eastern Health District. Two physicians showed up. The offer by the volunteer faculty of the Subcommittee on Alcoholism has been ignored, with the exception of a small gathering recently by the house staff of one of the smallest hospitals. In reality many more of us in the medical fraternity could inform ourselves on the more recent trends in recognition and treatment of the alcoholic. Numerous publications, a few good films, and above all the volunteer faculty for lectures are available through the Subcommittee on Alcoholism.

Elsewhere in this issue is an account of the highly successful cooperation of the City Health Department Alcoholism Clinic with a Baltimore general hospital.

Diagnosing and treating the alcoholic is only one of many unpleasant situations the practicing physician must face. The total inability and virtual prohibition to help the narcotic addict in private practice is an experience which most of us have frustratingly suffered. The papers relating to narcotic addiction in this issue make interesting reading. A slim ray of hope can be gained from the recent ambulatory treatment in connection with first offenders and the Probation Department of the courts.

The battered child has come into focus with increasing frequency, and it is hoped that discovery of this disheartening problem will become more obvious as physicians become increasingly alert to its existence.

Many of us have been placed in the unpleasant position of having to deny a patient the certificate of physical fitness to drive. Often patients and their relatives will attempt to outmaneuver the physician and will squeeze out some concession in order to retain the driving privilege. With the ever-mounting carnage on our roads, it becomes a matter of conscience for the physician to be sure that he is not the instrument which allows the truly disabled, incompetent, mentally and emotionally deranged person to add to the existing highway hazards to life and limb.

In most instances the disabled or incompetent or drunk driver is cited and subject to scrutiny only after he has had a traffic violation, which may already have caused bodily injury or death. Only when a person states on his renewal application that he has a mental or physical disability —and many do not—or when the Department of Motor Vehicles is tipped off by letter or telephone call that a particular driver has a disability, is such a person required to appear before the Medical Advisory Board.

The symposium by the Traffic Safety Committee adds to our knowledge of driving fitness. Since it is highly unpleasant for the practicing physician to personally have to deny a patient of long standing or a member of a valued patient family the right to operate a motor vehicle, it might be a distinct relief if a law were passed compelling the physician to report physical or mental disability to the Commissioner of Motor Vehicles for scrutiny by an impersonal committee of professional experts. This would be ideal but would meet with opposition on the part of the medical profession. It might be helpful, too, if agencies such as mental institutions, hospitals, heart evaluation centers, and neurology and eye clinics would exercise their powers by automatically reporting patients using their services. This special issue on the mores of medical practice, reminding us of the unpleasant problems we encounter in the daily practice of medicine, may be depressing. Hopefully, these papers will help us to meet these problems with more knowledge, a kinder attitude, and better patient understanding.

Baltimore's Alcoholism Clinic, now more than two years old, offers many services to help the physician in treating his alcoholic patients.

THE ALCOHOLISM CLINIC IN THE OVERALL TREATMENT OF THE ALCOHOLIC PATIENT

A. M. SCHNEIDMUHL, MD, MPH
Director, Alcoholism Clinic
Baltimore City Health Department

In September, 1963, Baltimore's first full-time Alcoholism Clinic opened at the Eastern Health District Building, 620 North Caroline Street. Within the framework of the Baltimore City Health Department, the new clinic gained the endorsement of the Medical and Chirurgical Faculty of Maryland, The Johns Hopkins School of Hygiene and Public Health, the State Departments of Mental Hygiene and of Health, and the Baltimore Area Council on Alcoholism. It also had established a mutual assistance program with Church Home and Hospital.

The clinic is now more than two years old, and it seems appropriate to report on its progress and again to offer its active cooperation to Baltimore physicians engaged in treating alcoholic patients.

First, a brief statement on the clinic staff and program. The full time staff consists of two psychiatric social workers, a clinical psychologist, an alcoholism counselor, and a secretary; working part time are a medical resident, an office clerk, and a number of dedicated volunteers. A Community Advisory Board, composed of leading citizens and representatives of the city's major official agencies, is regularly apprised of the clinic's activities. The board provides valuable assistance and general direction to the clinic's program.

The clinic is open to all residents of Baltimore City seeking help for drinking problems, either independently or as referred by physicians, employers, social agencies, clergymen, courts, and other interested parties. Services include physical, psychological, and social evaluations, individual and group psychotherapy, marriage counseling, chemotherapy, occupational therapy, nutritional consultation, and exposure to Alcoholics Anonymous. These services are offered as dictated by the particular needs of each patient. Whenever

possible, the patient's family—at least the spouse and teen-age children—share in the treatment program.

The clinic's philosophy, emphasized in all our contacts with and about patients, is that the alcoholic is a sick person, deserving of respect and consideration as a worthwhile human being, requiring special treatment but no special privileges.

During 1964, the average monthly intake was 11-12 patients (not including members of the patient's family). During the first eight months of 1965, the number had more than doubled (25-26 new admissions per month). Of the 206 new patients admitted January 1-August 31, 1965, the ratio of men to women was 3.5 to 1; 125 were between the ages of 31-50; more than half were married; and more than half of the women patients were housewives. Occupationally, the patients ranged from unemployed through blue-collar and white-collar workers to professional people.

Only about one-fourth to one-third of our patients seem to benefit from the clinic services. The others appear to lack motivation for treatment, either by prematurely terminating contacts with the clinic or by irregular clinic attendance, or by repeated relapses. We are trying to better understand this situation and to deal with it appropriately.

A. A high drop-out rate is expensive, both in terms of the apparent loss of the original investment (medical and psychosocial workups) if the patient does not return for treatment and in terms of the human suffering experienced by the patient and his immediate environment. Through the intervention of the family physician, the referring agency, or through home visits by the public health nurse, we made every effort to motivate the patient to return to the clinic.

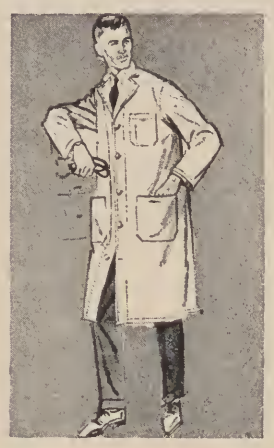
B. A follow-up study of all patients admitted between September, 1963, and March, 1965, is being made in cooperation with The Johns Hopkins School of Hygiene and Public Health and the Instructive Visiting Nurses Association. We hope this will shed some light on why patients drop out of treatment and, whenever feasible, appropriate steps will be taken to remedy the situation.

C. Patient drop-outs and relapses generally do not contribute to the staff's high morale and enthusiasm so necessary in the treatment of alcoholic patients. The chronicity of alcoholism and the lack of family and community acceptance of alcoholism as a treatable disease are only some of the known factors responsible for the drop-outs. In treating alcoholism, one must remember that alcoholics are numerous and varied, that different treatment techniques are necessary for a successful therapeutic program, and that there may be treatment approaches that have not yet been explored.

A thorough understanding of these factors, as well as regular reviews of current literature, case conferences with people prominent in internal medicine, psychiatry, psychology, and social work (serving as consultants), regularly scheduled staff meetings to discuss the treatment and progress of individual patients, proper selection of patients for appropriate treatment programs, active participation in community planning, and education in alcoholism are some of the staff morale builders which, unfortunately, are often neglected because of lack of time.

Cooperation between the clinic and the practicing physician is most important. In all of 1964, only seven patients were referred to the clinic by physicians (including psychiatrists); in the first eight months of 1965, 21 patients were referred by physicians. Referrals from general, veterans administration, and state hospitals also rose sharply over the same period: from 35 in 1964 to 58 during the next eight months. A review of the sources of referral shows that only 15-20 physicians are making use of the clinic services.

The practicing physician is, and must always be, the primary treatment resource for the alcoholic, as for all other sick people. Referrals to a specialized clinic or to a hospital are usually made by the practicing physician as part of an overall treatment program, depending on the needs of the patient.



At what point might the physician refer an alcoholic patient to the Alcoholism Clinic? It might be when he begins to see an unhealthy increase in tension within or around the alcoholic and his family. It might be when he recognizes that his alcoholic patient needs more specialized or more comprehensive treatment or more time than he can provide.

For whatever reason he makes the referral, the physician does not lose his patient to the

clinic. Indeed, the clinic's role is one of supplementing the physician's services. It makes every effort to maintain and strengthen the relationship between the patient and his physician. The clinic depends on the physician to do the necessary examinations, to treat any existing organic conditions, to arrange for hospitalization if indicated, and to follow up the patient when he no longer needs the special services of the Alcoholism Clinic. The clinic staff informs the physician of his patient's progress. If the patient drops out of treatment prematurely, the staff consults with the physician about possible means of re-engaging his patient in a treatment program, perhaps through the physician's contact with the patient and his family or through a home visit by a public health nurse or a member of the clinic staff.

In addition to providing direct services to the alcoholic patients referred by the practicing physician, the clinic staff is available for consultation on patients whom the physician continues to treat—on choice of one of the newer medications, for example, or on the choice of an inpatient facility for a patient.

All practicing physicians, and especially those in Baltimore City, are invited to regard the Alcoholism Clinic as a specialized medical facility designed to help them reclaim and rehabilitate the victims of alcoholism.

K. Merrill Sumey, Resident Manager

DEPROL®

meprobamate 400 mg. + benactyzine hydrochloride 1 mg.

Indications: 'Deprol' is useful in the management of depression, both acute (reactive) and chronic. It is particularly useful in the less severe depressions and where the depression is accompanied by anxiety, insomnia, agitation, or rumination. It is also useful for management of depression and associated anxiety accompanying or related to organic illnesses.

Contraindications: Benactyzine hydrochloride is contraindicated in glaucoma. Previous allergic or idiosyncratic reactions to meprobamate contraindicate subsequent use.

Precautions: *Meprobamate*—Careful supervision of dose and amounts prescribed is advised. Consider possibility of dependence, particularly in patients with history of drug or alcohol addiction; withdraw gradually after use for weeks or months at excessive dosage. Abrupt withdrawal may precipitate recurrence of pre-existing symptoms, or withdrawal reactions including, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, the dose should be reduced and operation of motor vehicles or machinery or other activity requiring alertness should be avoided if these symptoms are present. Effects of excessive alcohol may possibly be increased by meprobamate. Grand mal seizures may be precipitated in persons suffering from both grand and petit mal. Prescribe cautiously and in small quantities to patients with suicidal tendencies.

Side effects: Side effects associated with recommended doses of 'Deprol' have been infrequent and usually easily controlled. These have included drowsiness and occasional dizziness, headache, infrequent skin rash, dryness of mouth, gastrointestinal symptoms, paresthesias, rare instances of syncope, and one case each of severe nervousness, loss of power of concentration, and withdrawal reaction (status epilepticus) after sudden discontinuation of excessive dosage.

Benactyzine hydrochloride—Benactyzine hydrochloride, particularly in high dosage, may produce dizziness, thought-blocking, a sense of depersonalization, aggravation of anxiety or disturbance of sleep patterns, and a subjective feeling of muscle relaxation, as well as anticholinergic effects such as blurred vision, dryness of mouth, or failure of visual accommodation. Other reported side effects have included gastric distress, allergic response, ataxia, and euphoria.

Meprobamate—Drowsiness may occur and, rarely, ataxia, usually controlled by decreasing the dose. Allergic or idiosyncratic reactions are rare, generally developing after one to four doses. Mild reactions are characterized by an urticarial or erythematous, maculopapular rash. Acute nonthrombocytopenic purpura with peripheral edema and fever, transient leukopenia, and a single case of fatal bullous dermatitis after administration of meprobamate and prednisolone have been reported. More severe and very rare cases of hypersensitivity may produce fever, chills, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, anaphylaxis, stomatitis and proctitis. Treatment should be symptomatic in such cases, and the drug should not be reinstituted. Isolated cases of agranulocytosis, thrombocytopenic purpura, and a single fatal instance of aplastic anemia have been reported, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity has been reported, usually after excessive meprobamate dosage. Suicidal attempts may produce lethargy, stupor, ataxia, coma, shock, vasomotor and respiratory collapse.

Dosage: Usual starting dose, one tablet three or four times daily. May be increased gradually to six tablets daily and gradually reduced to maintenance levels upon establishment of relief. Doses above six tablets daily are not recommended even though higher doses have been used by some clinicians to control depression and in chronic psychotic patients.

Supplied: Light-pink, scored tablets, each containing meprobamate 400 mg. and benactyzine hydrochloride 1 mg.

Before prescribing, consult package circular.

Doctor's Day — March 30, 1966

Doctor's Day is a special day observed each year to honor the members of the medical profession, both living and dead, who have devoted their lives to the art of healing.

The idea of Doctor's Day originated in Georgia in 1933 and was adopted by the Woman's Auxiliary to the American Medical Association in 1934. Since the analogy of the carnation is closely intertwined with medical science, the red carnation was chosen in 1949 as the symbol of Doctor's Day.

March 30, the official date, commemorates one of the greatest discoveries for the alleviation of pain and suffering. On March 30, 1842, Dr. Crawford W. Long first used ether anesthesia in surgery.

In recognition of the doctors' contributions to the people and communities they serve, the Woman's Auxiliary to the Baltimore City Medical Society, in cooperation with the Baltimore City Public Schools and the local hospitals, hopefully plans to sponsor a Doctor's Day art contest with the emphasis on creating a happy atmosphere for patients of all ages.

Also in honor of Doctor's Day, a contribution will be made by our auxiliary to the American Medical Association Education and Research Foundation, to be divided equally between The Johns Hopkins and The University of Maryland schools of medicine.

Mrs. H. Leonard Warres, *President*
Woman's Auxiliary to the Baltimore City Medical Society

Mrs. Stuart D. P. Sunday, *Chairman*
Doctor's Day

THE GENERAL HOSPITAL'S ROLE IN SERVICES TO ALCOHOLIC PATIENTS

JOSEPH D'ANTONIO, MD
Chief, Department of Medicine
Church Home and Hospital

For slightly more than two years, Church Home and Hospital has had a collaborative relationship with the Alcoholism Clinic of the Baltimore City Health Department. Some observations on our experience during this period may help to open more general hospital doors to acutely intoxicated patients.

Between April 1, 1964, and March 31, 1965, Church Home and Hospital admitted as inpatients 22 alcoholics referred by A. M. Schneidmuhl, MD, director of the Alcoholism Clinic, and 32 alcoholics referred through other channels. In our experience, the acutely intoxicated patient who is adequately treated causes no special difficulty either to the attending physician or to the nursing personnel.

Through regular consultations with Dr. Schneidmuhl, the medical and nursing staffs at Church Home and Hospital have developed a basic philosophy and an effective treatment program for both the emergency room and in-hospital patients. The philosophy, emphasized throughout our contacts with and about alcoholic patients, is that the alcoholic is a sick person in need of medical treatment, deserving of respect and consideration as a worthwhile human being, requiring specialized treatment but no special privileges.

In brief, the therapeutic milieu, accurate diagnosis, and treatment of the surgical and medical problems (skull fractures, subdural or subarachnoid hemorrhage, cardiovascular accident, uremic, diabetic, or insulin coma, gastritis, hepatitis) which may accompany or complicate the acute phase of alcoholism, judicious and adequate use of tranquilizers (chlordiazepoxide, thioridazine, hydroxyzine, promazine) to combat psychomotor agitation and insomnia, correction of the existing physiologic abnormalities resulting from prolonged drinking (fluid and electrolyte imbalance, vitamin depletion), and adequate diet are the cornerstones of the treatment program.

Church Home and Hospital has worked closely with the Alcoholism Clinic in treating the acute phase of alcoholism and complications of alcoholism. This hospital's experience suggests that the general hospital has a significant contribution to make in the treatment of alcoholism.

Certainly the general hospital is inappropriate for long-term treatment of chronic alcoholism, but during the acute stage of alcoholism, the general hospital staff can help significantly in motivating the alcoholic to seek specialized help once he is detoxified and well enough to leave the hospital. At Church Home and Hospital, the alcoholic patients are seen in consultation by Dr. Schneidmuhl, and they are encouraged to apply to the Alcoholism Clinic for continuation of therapy.

Not all alcoholics in need of hospital care are acutely intoxicated; some are admitted for treatment of complications resulting from prolonged, excessive use of alcohol. With these patients, the hospital staff can make a greater contribution if, in addition to treating the specific complications, they show concern for the basic condition, namely, the heavy, uncontrolled drinking, and tell the patient about the specialized treatment program offered at the Alcoholism Clinic.

No one treatment resource can meet all the therapeutic needs of alcoholics. In the broad continuum of services needed for this population, the general hospital, along with the practicing physicians, the Alcoholism Clinic, and the alcoholic rehabilitation units of the state hospitals, can and should play an important and useful role.

THE NARCOTIC ADDICT

Some Reflections on Treatment

ALBERT A. KURLAND, MD
Director of Research, Department of Mental Hygiene

Narcotic addiction is a chronic disorder for which no effective treatment is known. Therapeutic efforts are confined to treating withdrawal reactions and trying to strengthen the personality structure of the addict. Many approaches are used, but their ultimate merit is questionable. The Research Department of the State Department of Mental Hygiene is investigating the deterrent effects of daily laboratory testing for opiates among patients closely supervised by a parole officer and receiving group psychotherapy.

This research is being supported by Grant MH-07616 from the National Institute of Mental Health, USPHS, Department of Health, Education and Welfare, and administered by Friends of Psychiatric Research, Inc.

The general practitioner is limited in treating the narcotic addict because of the legal problems involved, the difficulties of attempting to treat a withdrawal reaction outside of a closely supervised institutional setting, the problems in providing psychotherapeutic assistance over any extended period, and the complexity of social and supervisory resources necessary in the overall management. Consequently, his participation has mostly been focused on the diagnosis of narcotic usage, the treatment of one of its main complications, overdosage, and the providing of information and counsel relating to therapeutic resources available for the referral of such patients for treatment.

The physician who would attempt to treat the narcotic addict must, for all practical purposes, orient his approaches from a standpoint of a disorder which will require long-term management. The chronic nature of this disorder must not be lost sight of: otherwise, with the addict's propensity for having periods of exacerbations, there results an increasing feeling of frustration precipitating a sense of defeat and leading to a withdrawal by the therapist. This pessimistic outlook is verified by a number of reliable European and American studies, which report at least a 95% rate of recidivism during a five-year follow-up period.[1] Therapeutic experience with even well motivated, intelligent, and economically sound drug addicts has indicated a relapse after a five-year follow-up in most cases.[2] Many simi-

lar experiences have been reported by other highly capable clinicians concerned with the treatment of the narcotic addict.[3]

As the addict ages, his subsequent course often becomes obscured. Several reasons have been given for this. Among those suggested has been the development of more effective control in responding to the craving for narcotics, with the obvious implications. On the other hand, there are indications that the life expectancy of the narcotic addict may be lower because of death from accidental overdosage of illegally prepared narcotic preparations or from the complications resulting from the use of other drugs such as barbiturates, amphetamines, and alcohol.

The mechanism of the addition process is complex, involving physiologic, biochemical, and psychological parameters which are poorly understood. This is reflected in the attempts to quantify the process into habituation, physical and psychic dependence, and drug abuse. To explain these phenomena, a variety of models have been used. These have been described as cellular, neurophysiological, personality, psychoanalytic, conditioning, sociological, law enforcement, iatrogenic, and pharmacodynamic.[4] None of these, however, has been particularly rewarding in yielding suggestions for more effective therapy.

In view of this rather gloomy perspective, the therapeutic strategy in dealing with the vicissitudes of this disorder is perhaps best approached by focusing initially on the patient who has decided to make an attempt to "kick the habit." The factors which frequently bring about this decision in the narcotic addict are the development of a crisis in obtaining drugs, apprehension by a law enforcement agency, or mounting pressure from within the addict. The initiation of this step mobilizes a great deal of anxiety which frequently intensifies to the point of panic and precipitates a flight to a hospital.

Medical management of the acute withdrawal reaction is relatively simple and can be accomplished in a week or two. Most authorities on treating the narcotic addict agree on the importance of treating the withdrawal reaction in a properly equipped institutional setting because of the need for a high degree of supervision due to the manipulative behavior of this type of patient. With the subsidence of the withdrawal reaction, the voluntary addict soon demands to be discharged, providing little opportunity for making any additional plans.

If the addict does agree to participate in a treatment program, it should always be with the realization that intermittent deviations from abstinence are inevitable. At times these may progress to the point of re-addiction, necessitating another period of hospitalization for treatment of a withdrawal reaction. There is some evidence that consistently maintained help diminishes the number and periods of decompensation. This support maintained over a number of years may prevent the addict from compounding his delinquencies, which in turn lead to increasing punitive actions on the part of society with accumulating penalizations and a waste of the individual's life.

A program of sustained support is complex, requiring long-term supervision of the narcotic addict in the community. In our experience, prolonged hospitalization in a state hospital seems unwarranted in view of the poor therapeutic results.[5] Frequently, this type of hospitalization arouses increasing antagonism in the narcotic addict. This negative attitude may result either from his unrealistic expectations as to what treatment he will receive from the hospital or from the hospital's inability to provide any specific treatment other than custodial care. Furthermore, the narcotic addict finds it difficult to conceive of his being sick, in terms of the usual psychiatric disorders, although the use of special environmental settings, such as halfway houses and synanon settlements identified with the treatment of the narcotic addict, are readily accepted. Whatever use he may make of these facilities, he must ultimately return to his own environment and carry on as best he can.

Experimental approaches carried out by the research staff of the Department of Mental Hygiene led to the establishment of an outpatient clinic which provides psychiatric help for the narcotic addict after working hours in order to minimize conflict with his job. This program is geared to a high level of supervision employing laboratory control (daily urine analysis utilizing thin layer chromatography for the detection of opiates); supervision by a parole officer; and weekly attendance at the clinic for group psychotherapy and individual counseling.

The participation of the addict and the mainte-

nance of this control necessitates that the addict be either under court order or on parole from a correctional institution. Without this type of control, the attempt to obtain the narcotic addict's cooperation has proved ineffective. The present approach provides for a degree of monitoring to detect trends toward increasing breeches of abstinence with an opportunity to intensify the therapeutic management at critical periods.

Should this method of control fail, the addict can be returned to a correctional institution without loss of his opportunities for parole. At the same time, he has been helped to some extent from compounding his possible delinquencies before he finds himself overwhelmed by a full blown relapse. Under these circumstances, he may have a chance for another trial on the program. With the possibility of arresting or interrupting the trend toward readdiction, the hope is that there may be an increasing attenuation of the need for drugs after reinstitutionalization with a subsequent opportunity to return to this clinic at a not too distant date.

As the addict cycles through these periods of abstinence and deviation, he may ultimately be much more effective in helping himself achieve a greater degree of rehabilitation. It is still too early to predict the success of this approach, for this will require several years of observation. It is anticipated, however, that maintenance in this type of an ongoing program, based on sympathetic and humane considerations, may ultimately yield the reward of a gradually maturing individual who no longer has to flee from himself or the demands of society via a narcotic exit.

New low-cost tetracycline/ antifungal therapy

Tetrex®-F

tetracycline phosphate complex -nystatin

Because new Tetrex-F (tetracycline phosphate complex-nystatin) is the most economical therapy of its kind that you can prescribe, it is a sound choice whenever tetracycline therapy is indicated in patients predisposed to monilial infections.

Who are these "candidates for Candida"?

1. diabetic patients
2. nonpregnant women with a history of recent or recurrent monilial vaginitis
3. elderly or debilitated patients
4. patients with a past history of moniliasis
5. patients on long-term tetracycline or corticosteroid therapy.

For these patients, Tetrex-F (tetracycline phosphate complex-nystatin) provides efficient tetracycline therapy against a broad range of infections *plus* protection against superinfection associated with the overgrowth of *C. albicans* in the G.I. tract.

Priced for savings

Tetrex-F (tetracycline phosphate complex-nystatin) is lowest in cost—priced 20% lower than most tetracycline/antifungal products.

BRISTOL THERAPEUTIC SUMMARY
For complete information consult Official Package Circular.
Indications: Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms, in patients with increased susceptibility to monilial infections.
Contraindications: The drug is contraindicated in patients hypersensitive to its components.
Warnings: Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. No cases of photosensitivity have been reported with Tetrex (tetracycline phosphate complex). With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood).
Precautions: Bacterial superinfection may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months.
Adverse Reactions: Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis, and allergic reactions may occur.
Usual Adult Dosage: 1 capsule q.i.d. Continue therapy for 10 days in beta-hemolytic streptococcal infections. Administer one hour before or 2 hours after meals.
Supply: Capsules, bottles of 16. Each capsule contains tetracycline phosphate complex equivalent to 250 mg. tetracycline HCl activity and 250,000 units of nystatin. Oral Suspension, 60-ml. bottle. Each 5 ml. contains tetracycline equivalent to 125 mg. tetracycline hydrochloride and nystatin, 125,000 units.

Rolled-up in office routine?

The Lucas Design Group realizes that there's always a certain amount of tasteless office routine to be swallowed—but, they can at least add the rare seasoning which makes it far more palatable. Take filing systems and equipment, for instance. With the proper set-up, possibly re-located and coordinated with existing intra-office workings, the ever-present chores of filing and carding become swift, money-saving and delightfully simple. This is but one function of the Lucas Design Group, and a very important one. Have your secretary make an appointment for you, soon, with one of our designers. Get the entire story. MU. 5-3000.

Why is the incidence of drug addiction 100 times greater among physicians than among the general population?

DRUG ADDICTION

A Medical Hazard

JOHN C. KRANTZ, JR., PhD
Professor Emeritus of Pharmacology
University of Maryland School of Medicine;
Director of Scope, United States Pharmacopeia

Drug addiction is approximately 100 times greater among physicians than among the general population. This represents a waste of many valuable years of training and an extravagant use of funds for medical care. But what is most tragic is that society loses a doctor and acquires a patient that seldom can be cured. Drug addiction in a doctor is like the serpent in Eden; it will ultimately drive him out of the garden of his profession.

The principal drugs that evoke addiction are the derivatives of opium and certain synthetic chemical compounds which elicit pharmacologic effects similar to the alkaloids of opium. In many areas of the Orient smoking opium is a common custom involving a considerable segment of the population. In many of these areas, population pressures are so great that famine and pestilence are rampant. Hard labor with primitive tools exacts its devastation in misery and illness. Here opium often provides a surcease from the almost intolerable existence of the teeming, ignorant millions, and its effects are not so catastrophic. But such escape from reality has no place in Western civilization. In our culture these drugs have one purpose: to obtund intractable pain.

The pharmacologic basis for drug addition is complex and puzzling. Certain narcotic drugs, such as alcohol, produce tolerance and habituation, and in many people this is a grave malady. Yet the chronic alcoholic, if he has the will to abstain from all alcoholic beverages, can overcome the disease.

Withdrawal symptoms of alcohol are not serious; they are mainly psychic. The body does not acquire physical dependence on the presence of alcohol in the tissues. Morphine presents a different pattern of addiction. As with alcohol, the individual shows tolerance and habituation, but further, he develops a definite physical dependence upon the drug. Sometimes the withdrawal symptoms of morphine addiction are mainly psychic, but after long repeated use of the drug, physical dependence develops. The withdrawal of morphine after addiction produces devastating

symptoms which are ameliorated by a return to the drug.

True addiction is produced by opiates and certain synthetic narcotics. It has been defined as *that condition of mind or body induced by drugging which requires a continuation of that drug, and without which serious physical and/or mental derangement results.*

The World Health Organization (WHO) gives the following definition of drug addiction:

> Drug addiction is a state of periodic or chronic intoxication, detrimental to the individual and to society, produced by the repeated consumption of a drug (natural or synthetic). Its characteristics include: 1) an overpowering desire or need (compulsion) to continue taking the drug and to obtain it by any means; 2) a tendency to increase the dose; 3) a psychic (psychological) and sometimes a physical dependence on the effects of the drug.

In the United States about 80% of drug addicts are men and 56% are Negroes. Many addicts have criminal records. Furthermore, this problem is associated with life in congested urban centers. Of the approximately 50,000 addicts in the United States, 44% are in New York, 14% in Illinois, and 13% in California, and the addiction is concentrated in the large cities. Nevertheless, addiction may occur in any environment and in any stratum of life.

The number of people who become addicted from using narcotics prescribed by physicians for the relief of severe pain is comparatively small. The percentage of accidentally addicted estimated by Rayport (1954) was about 14% in more than 1000 cases. This suggests that the basic psychic pattern of the person plays a dominant role in addiction liability.

Approximately one-third of the addicts owe their addiction, in part at least, to overindulgence in alcohol. The same basic personality defect which leads to use of alcohol as an escape from reality is likely also to be responsible for their taking recourse to narcotic drugs.

Since about three-fourths of the addicts are first criminals, it appears that we are dealing with persons with a definite psychopathic diathesis. These are people who have misinterpreted their own environmental settings and their place in the social order and have attempted to mask the impact of reality by the effect of narcotic drugs.

In 1961 the estimated number of narcotic addicts in the United States was 45,000-50,000, an incidence of about one in 3,500 of the population. Estimates reflect that 92% used heroin, 3% used morphine, and most of the others used synthetic drugs, opium, paregoric, or codeine.

Addiction is not always easy to diagnose. Many addicts carry on their normal activities without physical or mental signs of their drug addiction. The pinpoint constriction of the pupil is usually a faithful criterion, although it fails in some addicts. As a rule the addict suffers with chronic constipation, interrupted intermittently by intestinal cramps and diarrhea. Injection depots may be visible on the body. These may have become infected, and abscess formation may be present. They usually appear in areas especially accessible to the individual with his needle and syringe.

Many personality changes take place in the drug addict. Outstanding is the tendency to become esoteric and introspective. He frequently shuns social contacts which formerly engaged his attention. Moral barriers seem to disintegrate. The clandestine, furtive manner through which he secures illegal narcotics appears to invade other segments of his life. Frequently leading questions which he poses regarding drug storage and supervision are diagnostic of his thought patterns concerning the acquisition of narcotics.

Injection of morphine into the addict does not bring the usual response of depression, sedation, and narcosis. He is generally a mendacious individual. Therefore, despite his history and possible physical signs, the most reliable diagnosis for addiction is the appearance of the withdrawal syndrome upon complete and enforced abstinence. The withdrawal syndrome may be induced precipitously upon the injection of nalorphine.

Since doctors are human beings, it is easily understood that a comparable proportion of them might become addicts. On the other hand, it might be argued that owing to the physician's superior training and social dominance in the community, the percentage of addicts in the medical profession would be less than that in the general population. Unfortunately neither of these two conditions prevails. Why is it, then, that the incidence of addiction in the medical profession is 100 fold greater than among the general population?

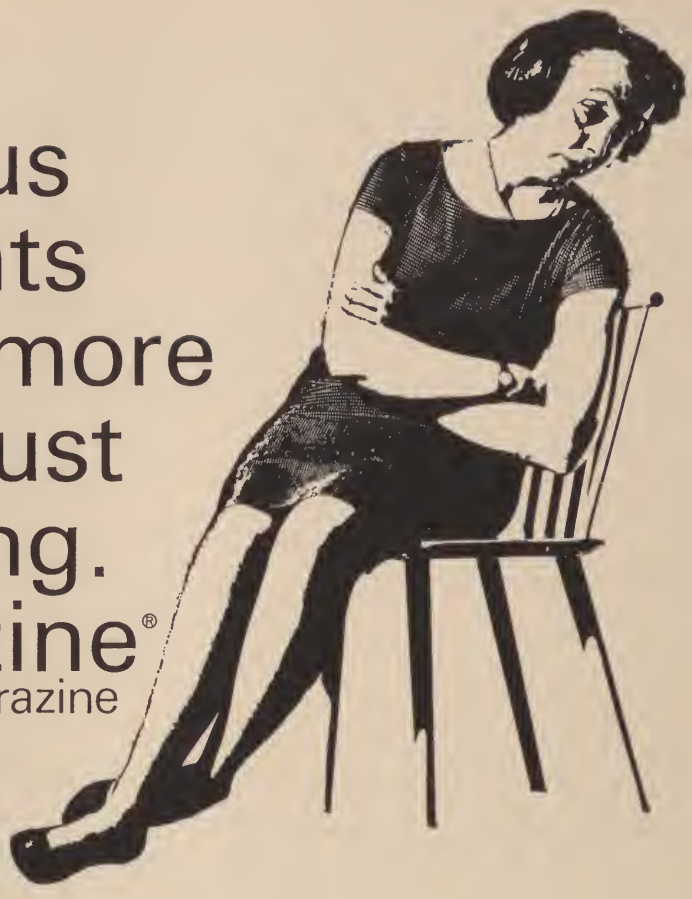
First, the degree in medicine and the license to practice have not changed the physician's status as a person. He is still subject to all of the temptations and moral ineptitudes that beset other people. Opiates, unlike the law of the land, do not recognize the MD degree. The millions of cells in the brains of physicians succumb as readily to the biochemical lesion of drug addiction as do those of non-physicians. Knowledge of drug addiction—and unfortunately many physicians possess only a smattering of this—is no protection against its ravages. The lesion is biochemical.

The second factor is the nature of the life the doctor must lead. There are comparatively few men in any society upon whom the mantle of Hippocrates falls. These are dedicated men. There is an emotional drain on the life of the doctor. The doctor needs relaxation and rest to protect his emotional life from the trauma of repetitious pain, death, and sorrow. Too often alcohol and barbiturates are used instead of a well-deserved and desperately needed vacation. Too often the doctor fails to heed the advice he gives to his patients, again forgetting that even though he is a doctor he remains a person.



The third reason for addiction among doctors lies in the driving forces of propinquity and availability. To obtain narcotics he does not need to rob a doctor of his bag, he has one at his bedside. After a devastatingly hard day, absorbing the shocks of the tumultuous sea of other peoples' troubles, if insomnia persists in spite of alcohol and barbiturates, the syringe with the narcotic is within arm's reach. And with it, he knows, fatigue will vanish, epigastric gnawing will be quelled, dizziness will be dispelled, and Morpheus will receive him with open arms. Once the Rubicon is crossed, the barriers are let down one by one, and the doctor is started on a broad highway to certain destruction. The escape from the impact of reality constantly haunts him as he continues at a devastating pace in chasing windmills. He can never forget the honeymoon of his addiction. The only sure cure for drug addiction is never to let it happen.

Many anxious patients need more than just calming. Stelazine®

brand of trifluoperazine

offers true tranquilization.

Sedative or muscle relaxant-type tranquilizers are often all that's needed for patients with temporary situational anxiety. But in the many patients whose anxiety presents a continuing problem these agents are limited by their generalized dulling effects.

'Stelazine' can attack anxiety directly without producing annoying dulling effects. On 'Stelazine', patients can react more normally to day-to-day stress yet remain alert, able to carry on their normal activities.

Contraindicated in comatose or greatly depressed states due to CNS depressants and in cases of existing blood dyscrasias, bone marrow depression and pre-existing liver damage. *Principal side effects,* usually dose related, may include mild skin reaction, dry mouth, insomnia, fatigue, drowsiness, dizziness and neuromuscular (extrapyramidal) reactions. Muscular weakness, anorexia, rash, lactation and blurred vision may also be observed. Blood dyscrasias and jaundice have been extremely rare. Use with caution in patients with impaired cardiovascular systems. Before prescribing, see SK&F product Prescribing Information.

THE ABUSED CHILD

KARL M. GREEN, MD

Citizens of the United States have been hearing and reading about the legislation involving the Battered Child Syndrome. Editorials, national conferences, and a series of four TV programs on the Huntley-Brinkley Report, in October, 1965, have discussed the moral, legal, and medical responsibilities of child abuse.

First reports of the correlation of roentgen manifestations of unrecognized fractures appeared in medical literature in 1953. Since then numerous articles have appeared with recent stress of good legislative laws and methods for determining the best management medically and legally. The magnitude of this problem probably never will be fully determined. Children under three years, especially those under one year, are most frequently involved. Forms of abuse may be physical, nutritional, and mental. Caffey, in 1946, reported the association of subdural hematoma and multiple fractures with trauma. Silverman described the association of these bone lesions to unrecognized trauma and a hospital survey by Kempe revealed that the number of cases was much higher than expected.

Five years ago only one state had a law requiring the reporting of physical abuse of children. Recently the Childrens Bureau of the Department of Health, Education and Welfare announced that 46 states now have such statutes. The exceptions, according to the bureau, are Alabama, Hawaii, Mississippi, Virginia, and the District of Columbia.

Child abuse is said to cause more deaths than auto accidents and such diseases as leukemia, cystic fibrosis, and muscular dystrophy. The incidence is estimated from 750 to 10,000 cases per year. New York State in the first eight and one half months of the law had 231 cases re-

This set of x-rays on one patient reveals multiple fractures in different stages of healing with long bone periosteal proliferation.

(X-rays courtesy of James Lyons, MD, University Hospital, Baltimore)

ported by medical sources. Child abuse occurs not only in the slums but also among professional families and those in the country club circles.

This entity has been well defined in other publications. The purpose of this paper is to re-emphasize the necessity of alerting the medical community to the problem. It certainly is one of the unpleasant aspects of medical practice.

Clinically the abused child may appear to have a history of a short illness before examination with gross discrepancy in the physical examination findings of malnutrition, anemia, and possibly fractures. The less obvious cases and the frequent changes of the source of medical attention make detection even more difficult. The highest incidence occurs in children too young to give a history. Trauma attributed to another sibling, hot liquid, accidental poisoning, accident proneness, unexplained convulsions, anemia, hematuria, and bruises may be the presenting symptoms.

A radiologist was the first to describe this entity, and radiologists often are the first to suspect it in a patient. The x-ray findings are characterized by long bone periosteal proliferation, metaphyseal corner fractures, epiphyseal injuries, and multiple fractures in different stages of healing.

After a single episode of trauma, the x-ray finding may reveal local soft tissue swelling; therefore a repeat x-ray examination in 10 days may be indicated to look for soft callous formation.

The periosteum in the infant is not as tightly adhered, and evidently trivial trauma allows separation with subperiosteal bleeding with elevation. Then subperiosteal calcification (illustration) appears in 10-14 days as a homogenous layer of calcification surrounding the bone. It may be localized or involving the entire shaft with the appearance of squaring of the ends of the long bones. A skeletal survey is probably indicated in all children with subdural hematomas.

The importance of these tragedies is that they are not self limiting, and there are many facets. The trauma is repeated until the patient is removed or the environment is changed. If the family is responsive to help, the best place for the child is at home, since removal may be disastrous and not all institutions and foster homes are adequate. The problem is a social, medical, and legal one. The laws passed by states grant physicians immunity when reporting suspicious cases, but all too frequently the physician avoids penetrating questions which might bring forth the unpleasant truth that he would be obliged to follow up.

Social agencies are becoming more aggressive in attempting to locate and help the involved families. A good social worker is one of the physician's best assistants in these matters to investigate in order to assert the medical, legal, and social aspects. From the social worker's evaluation, she can petition the appropriate legal division on behalf of the child.

It is important that physicians recognize this problem and follow the current events. Public opinion has greatly increased with the resultant laws. Physicians can contribute a lot not only to the medical aspects but also the legal and social aspects. Research is being done to define methods of prevention and to find a more realistic solution for the child and his parents.

The problem of the abused child involves most specialties of medicine. Reporting cases is a clear duty, just as with a gunshot wound. This problem is a challenge to every physician who treats children.

Doctor,

Here is the Abbott anorectic program designed to meet the individual needs of your overweight patients.

mood elevation

Abbott
Anorectic
Program

DESOXYN® Gradumet® (methamphetamine hydrochloride)

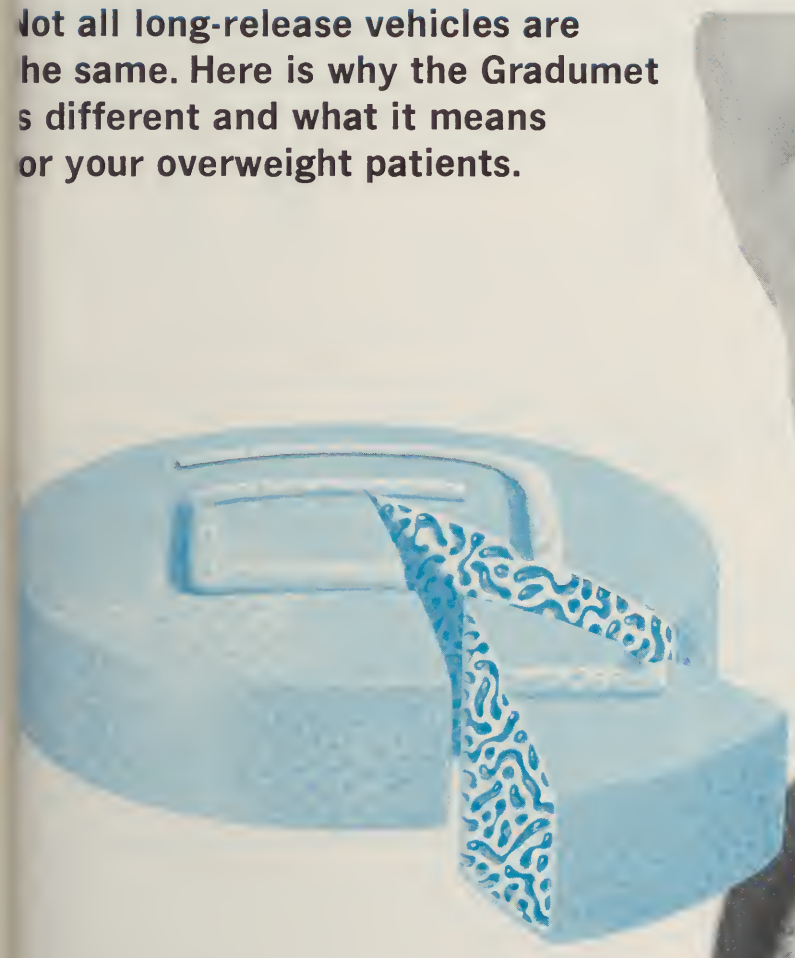
Smooth appetite control plus mood elevation.

The obese patient on a diet often has to battle depression as well as overweight. Desoxyn Gradumet helps the dieter in both battles by elevating the mood while it curbs the appetite. Thanks to the Gradumet, medication is smoothly released all-day from a single oral dose.

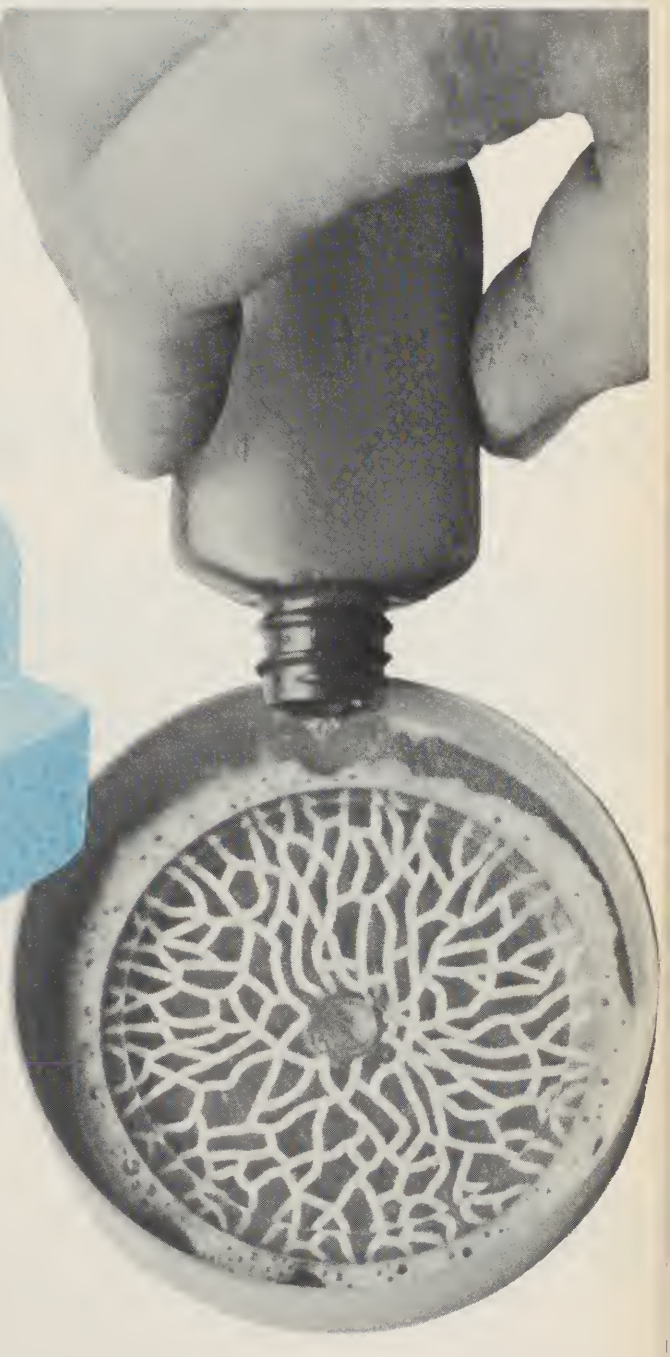
If she can't take plain amphetamine, put her on DESBUTAL® Gradumet

Calms anxieties; controls compulsive eating.

Desbutal Gradumet provides 2 drugs in 2 tablet sections, combined back to back to form a single tablet. One section contains Desoxyn to curb the appetite and lift the mood; the other contains Nembutal® (pentobarbital) to calm the patient and counteract any excessive stimulation.



Both drugs are released in an effective dosage ratio throughout the day.



controlled release

Abbott
Anorectic
Program

Not all long-release vehicles are the same. Here is why the Gradumet is different and what it means for your overweight patients.

The release action is purely physical and relies on only one factor common to every patient: gastrointestinal fluid. There is no dependence on enteric coatings, enzymes, motility, or an "ideal" ion concentration in the gastrointestinal tract.

Your patients get a measured amount of medication, moment by moment, throughout the day. They are not subjected to ups and downs of drug release . . . or to erratic release from patient to patient . . . or to erratic release in the same patient from day to day.

That's why the Gradumet provides controlled-release as well as long release.

Perhaps you saw the Gradumet model demonstration which shows that the release is entirely physical. When fluid is added, the drug in the outer ends of the channels dissolves. As fluid penetrates deeper into the channels, there is a continuous release of medication. The rate of release is rigidly controlled by the size and number of channels.

samples available

Each sample contains 6 tablets and a filled Sucaryl® Sweetener dispenser. For a supply, write Abbott Laboratories or ask your Abbott man.

economy

Patients, in many cases, save enough to get five weeks of medication for the price of four, compared to other leading long-release anorectics.

CONTRAINDICATION: Desoxyn and Desbutal are contraindicated in patients taking a monoamine oxidase inhibitor.

PRECAUTIONS: Use with caution in patients with hypertension, cardiovascular disease, hyperthyroidism, old age, or those sensitive to sympathomimetic drugs or ephedrine and its derivatives. Careful supervision is advisable with maladjusted individuals.

A Symposium on MEDICAL CONDITIONS CONSTITUTING A HAZARD IN DRIVING

RUTH W. BALDWIN, MD L. R. SCHOOLMAN, MD PHILIP WHITTLESEY, MD H. F. KINNAMON, MD

A. N. DOUDOUMOPOULOS. MD BARBARA HULFISH, MD IRENE L. HITCHMAN, MD

In 1947, at the request of the late Dr. Howard Bubert and the Commissioner of Motor Vehicles, the State Legislature authorized appointment of a board of physicians to advise the Commissioner as to whether drivers or applicants for licenses known or reported to have a medical condition should be allowed to drive. In the first year 45 people were seen. The number of people referred to the Medical Advisory Board gradually increased, and between July 1, 1964, and June 30, 1965, 2,480 people were seen. The board has had to increase its membership from six to 21 this past year and the number of meetings from 13 the first year to 89 in the past year.

Drivers or applicants for driver's license may come to the attention of the Medical Advisory Board in one of three ways: 1) by stating on the application form or renewal form that he or she has a mental or physical condition which may affect driving, 2) by a report from a physician, neighbor, member of family, etc., that a person has a medical problem, and 3) by police, magistrates, judges, or license examiners or reviewers.

From July 1, 1962, through June 30, 1965, 7,276 people were seen. The board recommended that 5,410 be approved and 1,866 be disapproved. Few of the cases approved have been involved in any accident as a result of their medical condition.

The aim is not to prevent a person with a medical problem from driving but to try to assure that his condition is under the best control possible and that he is a better risk. Most of these people are seen again at three-month to yearly intervals. This motivates them to keep their health at the best possible level, as the loss of license is always a threat. Many drivers disapproved once may be approved in a later visit when their medical condition has improved.

Members of the board do not examine these people except to check muscle power, blood pressure, etc. when indicated. The Medical Advisory Board depends upon reports from physicians and hospitals and may ask for additional tests or examinations before making a recommendation.

Ruth W. Baldwin, MD

BLACKOUTS, FAINTING, FITS, SPASMS, EPILEPSY

These terms are usually used interchangeably by the laity. This condition, if not controlled, is always a severe risk, as a brief moment of unconsciousness or amnesia can cause an accident. Thus, this group is carefully evaluated.

In the three-year period, 1,435 people with this condition were seen, of whom 1,000 were approved and 435 disapproved. Histories of type of seizures, age of onset, frequency, physical and neurologic examinations, electroencephalograms, and other tests done are requested. The medication taken is also considered.

A patient usually is required to have two to three years without a seizure before it is recommended that he drive. Since it is impossible to say an individual having seizures only in sleep won't have one in the waking period, the same rule applies. Even though a patient may have a prolonged aura, it is still considered a hazard for him to drive, as it is difficult to predict when he will have a seizure without an aura or with an aura too short to be of any help to him. Patients having amnesia attacks such as psychomotor or temporal lobe epilepsy are of particular risk because they frequently may have no aura and may have these seizures at unexpected times. Usually if a patient goes two to three years free of seizures, the chances for a seizure to occur is slight.

Once he obtains his license, the patient is asked to report any change in medication or seizure which may occur. He is also seen at 6-12 month intervals and after three or four years may be placed on an affidavit.

Ruth W. Baldwin, MD

DIABETES

Diabetes is the referring cause of 25% of cases before the Medical Advisory Board. It is an important cause of auto accidents not only because of the vascular pathology of the retina, heart, and extremities but also because of the more common and dangerous hypoglycemia as a side effect of drug treatment.

An acute attack of hypoglycemia may produce diplopia, weakness, disorientation, syncope, convulsions, and coma. Any one of these effects can cause an accident. Hypoglycemia can be produced by the oral drugs, Orinase, Dymenlor, Diabenese, and DBI, as well as by injections of insulin. The juvenile diabetic is particularly prone to sharp drops in blood sugar, not only from the hypoglycemic effect of drugs but also from irregularity of food intake and violent exercise. Diabetics, especially the juvenile, must know what hypoglycemia is, how it may affect him, and how to treat it. We want to see each diabetic at least once to be certain that he understands hypoglycemia and its treatment, and we carefully instruct him always to carry sugar or candy in his car.

The visual complications of diabetes, retinitis, and early cataract may cause partial or complete loss of vision. These conditions do not come on acutely and are usually apparent to the person. We must be certain that the diminished visual acuity is not enough to threaten traffic safety. Ordinarily we do not test vision but rely on the written report of the physician. Should we detect grossly poor vision or have any doubt about the reported vision, we require a reexamination by a qualified ophthalmologist, meanwhile recommending suspension of the driver's license.

Hyperglycemia and ketoacidosis to the level of coma has not been a problem. This condition comes on gradually over a period of hours and usually makes the person too ill to take the wheel. Yet it may occur more acutely, particularly in a young diabetic ill from some bacterial or viral infection. All diabetics must be warned about the onset of drowsiness while driving as a possible precursor of coma.

Diabetes and its present drug treatment commonly produce hazards to traffic safety in the form of diminished vision and hypoglycemic episodes. It is important that every diabetic be examined by the Medical Advisory Board to check on these risks. To save the applicant unnecessary repeat visits, we urge the physician who receives one of our diabetic forms to carefully make and report the complete examination requested. In this way we will be helped to make the highways safer for all.

L. R. Schoolman, MD

CARDIAC DISABILITY

The effects of cardiac problems which may present a driving hazard are 1) alterations in judgment, 2) inadequate reaction time, 3) unconsciousness.

Cardiac difficulties which result in or produce cerebral anoxia, pain, or syncope are the sources of concern. In the past three years, 1,032 such cases have been seen by the Medical Advisory Board. In 783 a recommendation was made for continued driving; in 249, the recommendation was that driving not be continued, either temporarily or permanently. The recommendations were based on information provided by the patient in an interview with the board together with medical information provided by the physician.

The commonest problems have been:

1. Aortic stenosis, symptomatic
2. Stokes-Adams syncope

3. Heart block, complete or incomplete, variable or symptomatic
4. Myocardial infarction
5. Coronary insufficiency with angina
6. Aortic aneurysm, particularly thoracic, and symptomatic
7. Valvular disease resulting in cardiac surgery, especially those resulting in the use of prosthetic valves, with embolic potential
8. Cardiac arrhythmias resulting in implantation of pacemakers and paroxysmal arrhythmias capable of producing syncope of distraction
9. Chronic congestive heart failure with resulting cerebral edema and anoxia with resulting diminution in judgment and prolonged reaction time

ASCVD with symptoms of senility and delayed reaction is a problem frequently seen but not listed here under cardiac disturbances.

In order to advise the Commissioner whether the hazard is remote both for the patient and his fellow motorists, the Medical Advisory Board needs all appropriate factual, physical, historical, laboratory, and therapeutic data along with the physician's prognosis and recommendations for continued care. An interview with the patient helps the Board to assess the patient's functional capacity.

Often the patient does not take the medications which the physician has prescribed and fails to see his physician at the recommended intervals. The Board's request for current and continuing information from the patient's physician often provides more frequent follow-up by the physician and lessens the risk on the road. The subjectively tender question of when a person may safely drive without significant hazard to others after he has had a coronary occlusion and after cardiac surgery, for instance, places an unnecessary onus on the physician. The decision should be made by the Commissioner, based on appropriate information from the physician.

Medication poses a problem, particularly with respect to those possible effects in altering judgment or reaction time. On the other hand, the patient's own failure to take medication, either because he has been asymptomatic or because he has forgotten or for financial reasons, has often brought about the return of jeopardizing symptoms. Those conditions which remain stable for prolonged periods, particularly arrhythmias and valvular disease states, generally do not produce jeopardizing symptoms, and most patients are permitted to continue driving.

Philip Whittlesey, MD

ORTHOPEDIC PROBLEMS

Between July 15, 1962, and June 30, 1965, 1,449 patients with orthopedic problems were seen. Of this number, 1,363 had paralytic conditions and 86 were amputees. Paralytic conditions included polio, hemiplegia, spasticity, and traumatic paralysis. Amputees both with and without prostheses were considered. Of the paralytics, 1,157 were approved and 206 disapproved in recommendations to the Commissioner; of the amputees, 70 were approved and 16 disapproved.

Of each patient the Board considers, "Is this patient a safe driver to himself and to others?" If the verdict is that he is an unsafe driver, the Board considers whether special equipment be provided for the vehicle which help the patient to be a safe driver.

If the patient has a stable deformity or problem, usually one visit to the Board is sufficient. If the patient is making progress with treatment, he would be asked to return, especially if he is regarded as unsafe on first visit.

Howard F. Kinnamon, MD

MENTAL RETARDATION

Only three applicants with mental retardation were seen in the past three years; one was recommended for approval and two were not. Usually if the applicant can read or recognize signs, he is deemed able to drive unless his retardation is severe. In general, only those in the minimally retarded range are considered candidates for driving. If some other problem coexists, such as a behavior problem or another handicapping condition, then the risk increases and the advisability of allowing him to drive is lessened.

Ruth W. Baldwin, MD

PSYCHIATRIC DISORDERS

The emotionally well-adjusted driver is a safe driver. The emotionally disturbed driver is accident prone and can be a menace on the road. Driving is a full time job. In most accidents, the driver was preoccupied with matters other than

driving. Individuals who are under severe stress or are depressed or hallucinating should not drive. Unfortunately, the emotionally disturbed person either is unable to recognize that he cannot drive safely or refuses to accept the fact.

Between July 1, 1962, and June 30, 1965, 982 patients with some form of psychiatric disturbance were seen. Of these, 535 were recommended for approval and 447 were not.

A. N. Doudoumopoulos, MD

NEUROLOGICAL PROBLEMS

The most important consideration often turns out to be not the specific disability but how the patient handles it. Depression, irritability, intelligence, maturity, understanding of his illness, his attitude, mental alertness, and experience may mean far more than whether the patient can move only one finger or not. Also, whether the condition is changing or static is often more important than the condition itself. A patient who loses one eye secondary to trauma usually learns to accommodate to loss of depth perception in one and a half to two years, but if he has intermittent ptosis, he may be a hazard for much longer.

Only the exceptional patient can learn to drive for the first time after a sudden onset of neurologic deficit. Detailed tests for the integrity of the sensorium, particularly recent memory and ability to catch on to jokes is useful.

Corollary conditions which ordinarily would not concern one may be important, as in the person who gets arthritis in his left knee and has a mild Parkinson's disease affecting primarily the right side or the patient who gets hemianopsia but cannot turn his head to compensate because of cervical osteoarthritis.

A good criterion of mental ability is whether the patient is *mentally* capable of carrying on his old job(s) even if his limbs are impaired to the point that this is no longer practicable. If so, perhaps, hand controls or a "spinner" on his wheel or changing his dimmer switch to another site is all that is necessary.

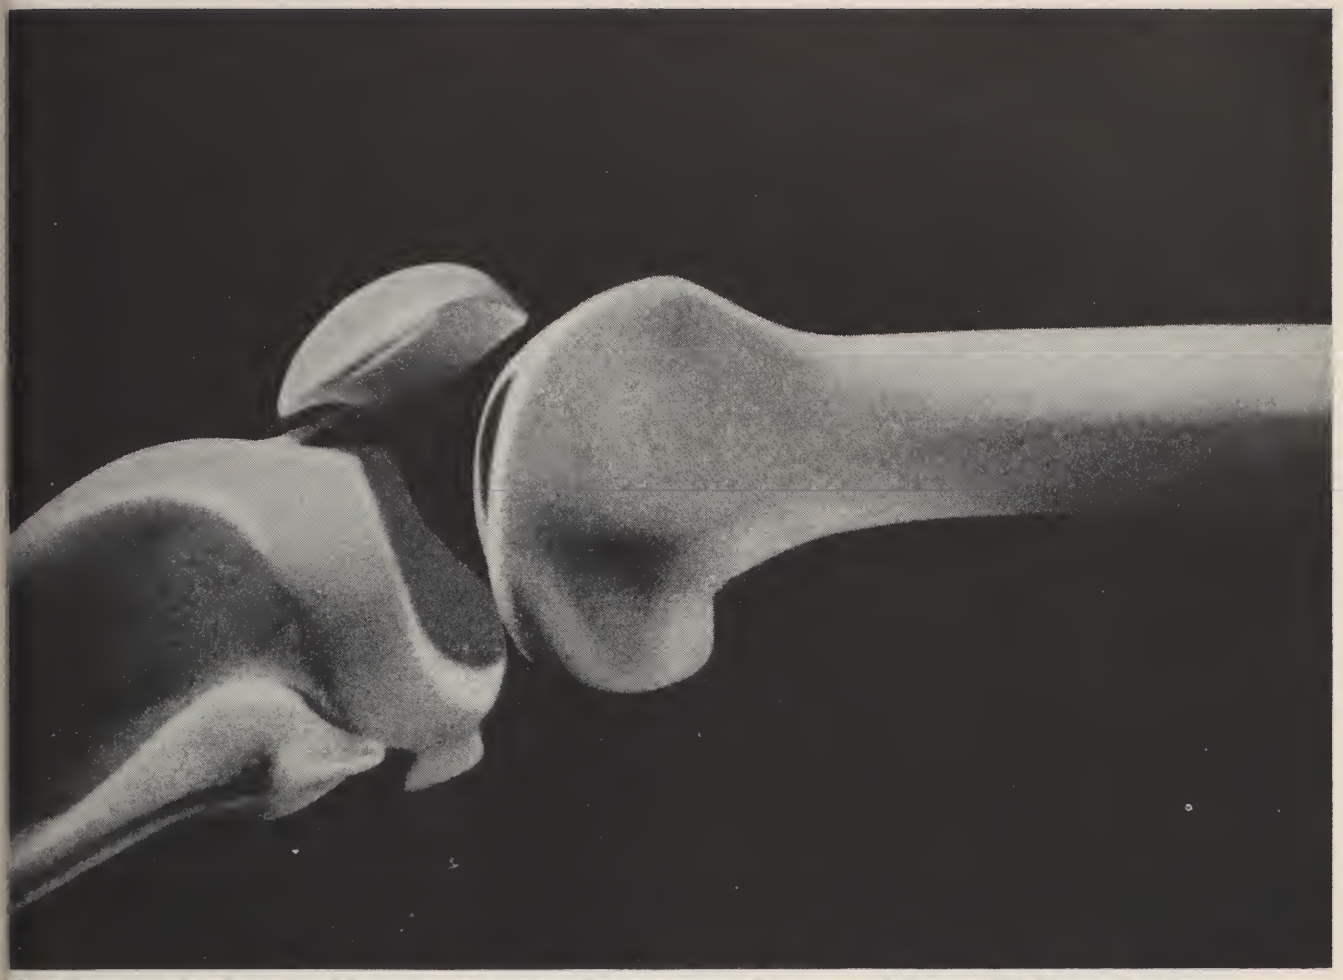
Other considerations include how long the patient has been driving, how much driving he has done in the past three to five years as traffic conditions have become more complex, whether he has ever driven a cab, bus, or truck professionally and for how long and how long ago, where and what traffic conditions predominated, his accident record, and whether he had more frequent accidents (or close shaves) in the past year or two than previously.

It is wise to see neurological patients late in the day—even in the evening, if possible—as many conditions become worse later in the day. This is particularly true of myasthenia gravis. Many patients who have full recovery after a stroke or an exacerbation of multiple sclerosis begin to drag a leg again or become ataxic with a cold and unknowingly become hazardous.

In a teen-aged patient, his school grades and extracurricular activities may give a clue to his conscientiousness, his maturity, his judgment, and his tenacity.

Between July 1, 1962, through June 30, 1965, 578 people were seen with atrophic or degenerative neurological conditions, including multiple sclerosis, myasthenia gravis, Parkinson's disease, and Huntington's chorea. Of these, 356 were recommended for driving and 222 were rejected.

Barbara Hulfish, MD



ALCOHOLISM

Of all the drivers referred to the Board during the past three years, 310 were alcoholics or problem drinkers. The Board recommended that 169 of these applicants be approved and 141 be disapproved. The ratio of approvals to disapprovals for all types of medical disability is about three to one. The high proportion of medical disapprovals for alcoholic drivers indicates the physicians' concern for the public safety.

The alcoholic referred to the Board is evaluated by means of a personal interview, a medical report from his family physician, or by hospital reports with the medical and social history. In a questionable case, a relative may be interviewed or a psychiatric examination may be requested before a recommendation is made to the Commissioner of Motor Vehicles.

An article on the alcoholic driver is being prepared for a future issue of the MARYLAND STATE MEDICAL JOURNAL.

Irene L. Hitchman, MD

Butazolidin® alka

Usually works within 3 to 4 days in osteoarthritis

henylbutazone	100 mg.
ied aluminum droxide gel	100 mg.
agnesium trisilicate	150 mg.
omatropine ethylbromide	1.25 mg.

he trial period need not exceed 1 week. In ontrast, the recommended trial period for domethacin is *at least 1 month.*

hat's why it's logical to start therapy with utazolidin alka—you'll know quickly whether not it works. And usually, it will.

large number of investigators have reorted major improvement in about 75% of ases. Some patients have gone into remison. Relief of stiffness and pain may be fol-wed quickly by improved function and resution of other signs of inflammation. And utazolidin alka is well tolerated, especially nce it contains antacids and an antispasodic to minimize gastric upset.

ontraindications
dema, danger of cardiac decompensation; story or symptoms of peptic ulcer; renal, epatic or cardiac damage; history of drug llergy; history of blood dyscrasia. The drug ould not be given when the patient is se-le, or when other potent drugs are given oncurrently. Large doses are contraindiated in patients with glaucoma.

recautions
btain a detailed history and a complete hysical and laboratory examination, including a blood count. The patient should be closely supervised and should be warned to report immediately fever, sore throat, or mouth lesions (symptoms of blood dyscrasia); sudden weight gain (water retention); skin reactions; black or tarry stools. Make regular blood counts. Use greater care in the elderly.

Warning
If coumarin-type anticoagulants are given simultaneously, watch for excessive increase in prothrombin time. Pyrazole compounds may potentiate the pharmacologic action of sulfonylurea, sulfonamide-type agents and insulin. Carefully observe patients receiving such therapy.

Adverse Reactions
The most common are nausea, edema and drug rash. Hemodilution may cause moderate fall in red cell count. The drug may reactivate a latent peptic ulcer. Infrequently, agranulocytosis, generalized allergic reaction, stomatitis, salivary gland enlargement, vertigo and languor may occur. Leukemia and leukemoid reactions have been reported but cannot definitely be attributed to the drug. Thrombocytopenic purpura and aplastic anemia may occur. Confusional states, agitation, headache, blurred vision, optic neuritis and transient hearing loss have been reported, as have hepatitis, jaundice, and several cases of anuria and hematuria. With long-term use, reversible thyroid hyperplasia may occur infrequently.

Dosage
The initial daily dosage in adults is 300-600 mg. daily in divided doses. In most instances, 400 mg. daily is sufficient. When improvement occurs, dosage should be decreased to the minimum effective level: this should not exceed 400 mg. daily, and is often achieved with only 100-200 mg. daily.

Also available: Butazolidin®,
brand of phenylbutazone
Tablets of 100 mg.

Names and addresses of above physicians received too late to appear in the Directory of Registered Physicians.

normal activity...

promptly...

In children with diarrhea prompt symptomatic control is usually urgently indicated to relieve cramping and to prevent dehydration.

Lomotil halts precipitous progress through the intestines and controls diarrhea with notable promptness, safety and effectiveness.

Experimental evidence[1] has shown that Lomotil is more efficient in this regard than morphine without the latter's manifest disadvantages. In roentgenographic study[2] Lomotil slowed gastrointestinal propulsion within two hours.

At the same time, by diminishing overstimulation of the intestines, Lomotil relieves the abdominal cramps and discomfort so distressing to youngsters.

Lomotil gets children off toast and tea and back to normal diets and normal activity with gratifying celerity.

with LOMOTIL® liquid/tablets

Each tablet and each 5 cc. of liquid contains:
diphenoxylate hydrochloride ..... 2.5 mg.
(Warning: may be habit forming)
atropine sulfate ..... 0.025 mg.

Dosage: For full therapeutic effect—Rx full therapeutic dosage. The recommended initial *daily dosages,* given in divided doses, until diarrhea is controlled, are:

Children:

3 to 6 months—3 mg. (½ tsp.* t.i.d.)
6 to 12 months—4 mg. (½ tsp. q.i.d.)
1 to 2 years—5 mg. (½ tsp. 5 times daily)
2 to 5 years—6 mg. (1 tsp. t.i.d.)
5 to 8 years—8 mg. (1 tsp. q.i.d.)
8 to 12 years—10 mg. (1 tsp. 5 times daily)

Adults: 20 mg. (2 tsp. 5 times daily or 2 tablets 4 times daily)

*Based on 4 cc. per teaspoonful.

Maintenance dosage may be as low as one fourth the therapeutic dose.

Precautions: Lomotil, brand of diphenoxylate hydrochloride with atropine sulfate, is an exempt narcotic preparation of very low addictive potential. Recommended dosages should not be exceeded. Lomotil should be used with caution in patients with impaired liver function and in patients taking addicting drugs or barbiturates. The subtherapeutic amount of atropine is added to discourage deliberate overdosage.

Side Effects: Side effects are relatively uncommon but among those reported are gastrointestinal irritation, sedation, dizziness, cutaneous manifestations, restlessness and insomnia.

ANNUAL MEETING OF MEDICAL AND CHIRURGICAL FACULTY

APRIL 27 and 28, 1966 — BALTIMORE, MARYLAND

APRIL 29-MAY 4, 1966 — ABOARD SHIP AND IN BERMUDA

MAKE YOUR HOTEL ROOM RESERVATIONS NOW

for the

ANNUAL MEETING OF MEDICAL AND CHIRURGICAL FACULTY

APRIL 27 and 28, 1966

A block of rooms has been set aside at the SHERATON-BELVEDERE HOTEL, Baltimore, for those attending this meeting. Because of many activities in the city, rooms will be at a premium.

The rates will be from $16.50 to $18.50 for a twin bedded room and bath for two persons; single occupancy will be $12.50 to $14.50.

FOR YOUR HOTEL RESERVATION DETACH AND MAIL THIS SLIP DIRECTLY TO:

Mrs. Jacqueline Amati

SPLENECTOMY IN THE TREATMENT OF HEMATOLOGIC AND NON-HEMATOLOGIC DISORDERS

The Annual J. M. T. Finney Fund Lecture

Dr. Coffey

Robert J. Coffey, MD, who will give this lecture on Wednesday, April 27, is professor of surgery and director of the Department of Surgery, Georgetown University Medical Center. Dr. Coffey was born in Elmira, NY, received his MD at Georgetown University Medical School, an MS in medicine and a PhD in surgery at the University of Minnesota. He served in the United States Navy for four years. Dr. Coffey is chief of surgery, Georgetown Division, District of Columbia General Hospital; consultant in surgery, U.S. Naval Hospital in Bethesda, the Andrews Air Force Base Hospital, and the Mt. Alto Veterans Hospital. He is president of the Southeastern Surgical Congress, governor of the American College of Surgeons, a member of several other surgical associations, and a licentiate of the American Board of Surgery. This year Dr. Coffey is president of the District of Columbia Medical Society.

MORE ABOUT THE CRUISE CONVENTION

Among the Annual Meeting speakers aboard the SS Argentina will be Doctors Faraino, Paulson, Peeler, and Dr. W. H. C. Masters of Bermuda. Last month this Journal contained information about the others who will give papers during the cruise convention: Doctors Cornbrooks, Mech, and Rappeport. Grand round films will be shown daily aboard ship.

Frank A. Faraino, MD, of Baltimore, will present a paper on Sunday, May 1, on the **"Surgical Treatment of Heart Block."** Attending this lecture will be the physicians of Bermuda, as well as the physicians on the cruise. After receiving his MD from the University of Maryland, Dr. Faraino interned at Mercy Hospital in Baltimore. Upon the completion of his general surgical training, he received training in thoracic surgery at the University, Baltimore City, and Mercy Hospitals. While in the US armed forces, he was chief of thoracic surgery at Lackland Air Force Hospital, San Antonio, Tex. Dr. Faraino is a member of the American College of Chest Physicians, the American Thoracic Society, and the American College of Surgeons. He is certified by the American Board of Surgery and the Board of Thoracic Surgery.

Dr. Faraino

Dr. Paulson

Moses Paulson, MD, is an associate professor of medicine at The Johns Hopkins University School of Medicine and physician at The Johns Hopkins Hospital. He will speak on **"Changing Concepts of Indeterminate Intestinal Inflammatory States and Their Management."** Dr. Paulson was born in Baltimore and received his BS and MD degrees from the University of Maryland. He was engaged in full time gastroenterologic research at The Johns Hopkins Hospital from 1929 to 1932. He continued his research on a part time basis until 1956. He conducted the gastrointestinal clinic there from 1943 to 1956. His studies concerned the etiology of ulcerative colitis, the medical management of the colon residing in situ in whole or in part after ileostomy performed for relief from ulcerative colitis, involving eventual restoration of intestinal continuity often in its entirety, the study of the virus of lymphogranuloma venereum in relation to ulcerative colitis, changes following human TOTAL gastrectomy including the hematologic sequences leading to pernicious anaemia; esophagoscopy and gastroscopy during active upper digestive tract hemorrhage; endoscopic appearances and behavior of the distal ileum after proctocolectomy and ileoanostomy for ulcerative colitis and intestinal polyposis; the incidence of intestinal parasites in the temperate zone, and the first demonstration of residual hepatic damage following infectious hepatitis.

He is author or co-author of 50 publications, including contributions to sections or chapters to systems of medicine and several books. He is now editing Paulson's **Gastroenterologic Medicine,** to be published by Lea & Febiger.

"Waldenström's Macroglobulinemia: A Family Study" is the title of a paper to be given by **Richard N. Peeler, MD,** of Annapolis. Dr. Peeler was born in Salisbury, NC, attended Catawba College, and received his MD degree from The Johns Hopkins University School of Medicine. He served an internship and assistant residency at The Johns Hopkins Hospital, followed by a fellowship in immunology and infectious disease. Dr. Peeler, who is in the private practice of internal medicine in Annapolis, is chief of medical service at the Anne Arundel General Hospital and instructor in medicine at The Johns Hopkins. He is a fellow of the American College of Physicians.

168th ANNUAL MEETING OF THE MEDICAL AND CHIRURGICAL FACULT

April 27 and 28 at the Alcazar, Baltimore

HOUSE OF DELEGATES MEETINGS

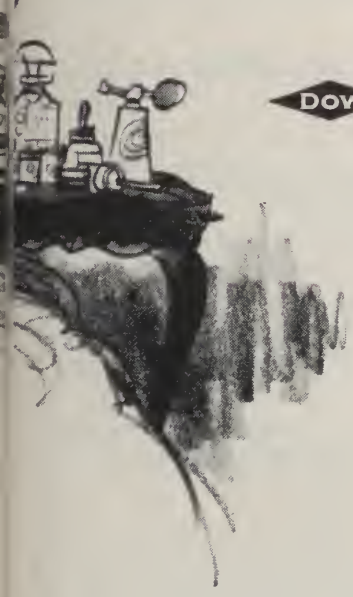
Telephone — 727-1696

If you can hang on for a few minutes, Doctor, I'm sure I'll start coughing again.

Some patients don't realize there's more to a cough than meets the ear.

If it's the useless, exhausting type of cough that often accompanies respiratory infection or allergy, you can provide prompt relief with Novahistine DH. Its decongestant-antitussive action controls frequency and intensity of cough spasms without abolishing cough reflex. And the fresh, grape flavor of Novahistine DH appeals to children and adults alike.

When your diagnosis is bronchitis, complicated by thick tenacious exudates, Novahistine Expectorant is particularly useful. It not only provides decongestive action and controls the cough, but also encourages expectoration, thus easing bronchial constriction and obstruction.



Use with caution in patients with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Ambulatory patients should be advised that drowsiness may result. Continuous dosage over an extended period is contraindicated since codeine phosphate may cause addiction.

Each 5 ml. teaspoonful of Novahistine DH contains codeine phosphate, 10 mg. (Warning: may be habit forming); phenylephrine hydrochloride, 10 mg.; chlorpheniramine maleate, 2 mg.; chloroform (approx.), 13.5 mg.; l-menthol, 1 mg. (Alcohol 5%). Each 5 ml. of Novahistine Expectorant contains the above ingredients and, in addition, glyceryl guaiacolate, 100 mg.

NOVAHISTINE® EXPECTORANT

DOW **PITMAN-MOORE** Division of The Dow Chemical Company, Indianapolis

VENEREAL DISEASE FILMS AVAILABLE

Several films which stress the dangers of venereal disease and the vital importance of early recognition and treatment may be borrowed without charge in Maryland from the State Health Department. Facts are presented dramatically and impressively, and the terminology is tailored to lay audiences. Physicians may find these brief descriptions helpful in answering inquiries regarding visual aids for use by schools, clubs, community groups, and other organizations interested in health education:

The Innocent Party, an 18-minute color film, features a student who has contracted syphilis through a casual encounter in a nearby town and has transmitted it to a young girl in his own community. Appropriate for general audiences, it is recommended especially for showing to teenage groups and young adults.

Dance, Little Children, a 25-minute color film, describes the course of a syphilis outbreak among 12- to 19-year-old boys and girls. One boy's impulsive "pick-up" starts a chain of infection that results in 50 venereal disease cases in a small community. Parental attitudes, prompt medical care, and health department action to safeguard public health are emphasized. This picture is suggested for use by adult moderators of youth groups, teachers and adult organizations.

A Quarter Million Teenagers, a color filmstrip, shows in 70 graphic pictures the types of organisms which produce syphilis and gonorrhea, early symptoms in boys and girls, how the diseases spread unless treated promptly by a physician, and the tragic effects on individuals and unborn children. It is recommended for showing to junior and senior high school and college classes. A 16-minute color motion picture with the same title and content also is available.

Message to Women, a 20-minute color film on syphilis and gonorrhea, emphasizes to mothers the importance of informing their daughters regarding the risk of venereal disease. Animated charts illustrate the effects of these diseases in women. This presentation is particularly appropriate for parent education groups, parent-teacher associations, and women's organizations. It is suitable also for senior high and college students.

Films and filmstrips for use by professional personnel engaged in venereal disease control include:

Identification of Early Syphilis, a 30-minute color film, stresses the importance of suspecting syphilis in office patients and the necessity of being able to recognize the early signs.

Introduction to the Fluorescent Treponemal Antibody Test, a nine-minute color film, illustrates the preparation of treponemal antibody antigen and demonstrates the technique of staining with fluorescent material. It also pictures reactions obtained by means of ultraviolet light microscope assembly and the method used in the preparation of tagged globulin and its chemical purification.

Diagnosis of Primary Syphilis, a filmstrip with tape recorded narrative, indicates some common errors in diagnosis of syphilis, the location of lesions, and differences between syphilitic lesions and the lesions caused by other diseases.

All of the films may be borrowed from the film library, Maryland State Department of Health, 301 West Preston Street, Baltimore.

chronic fatigue—lethargy

sistent insomnia

severe anorexia—weight loss

when emotionally based complaints fit the symptom profile of depression

recurrent G.I. upset

nical Considerations: **Contraindications**—Glaucoma, urinary retention, bone marrow depression, pregnancy, drug-induced CNS depression. **Precautions**—The same se for the two components, perphenazine and amitriptyline. Use carefully in patients with histories of convulsive disorders or adverse reactions to phenothiazines. ETRAF entiates effects of antidepressants, CNS depressants, atropine, phosphorous insecticides, and heat. The antiemetic effect of the perphenazine component may conc itence of brain tumor, intestinal obstruction, or toxicity due to overdosage of other drugs. Consider the possibility of potentiation in combined use with MAOI drugs. G lly allow two weeks between therapies. Not recommended for use in children. **Warning:** Patients who become drowsy with ETRAFON should be cautioned against drivin or operating machines requiring alert attention. Response to alcohol may be potentiated. **Side Effects**—Similar to those reported following the use of either compo en used alone. For perphenazine alone, side effects caused by any of the phenothiazines may occur. These include extrapyramidal symptoms, autonomic reactio cluding hypertension), blood dyscrasias, liver damage, endocrine disturbances, allergic reactions, peripheral and cerebral edema, reversed epinephrine effect, grand m vulsions, polyphagia, reactivation of psychotic processes. For amitriptyline alone, drowsiness, hypotension, numbness and tingling of extremities, transient confusion h dosages), activation of latent schizophrenia (although perphenazine in ETRAFON may prevent this reaction in some cases). Dose-related anticholinergic reactions are p e. Rare appearance of agranulocytosis, jaundice, and peripheral neuropathy, all possibly of drug origin, have been reported in patients receiving amitriptyline. For m plete details, consult Schering literature available from your Schering Representative or Medical Services Department, Schering Corporation, Union, New Jersey 07 Lehmann, H. (8) Mattey, W. E.: Current Therap. Res. *5*:310, 19

Scheri

ıew Ltrafon ielps restore the ppetite for ife

Whe the patient's symptom pattern and the absence of physical findings confirm your suspicion of a depressive state, ETRAFON w sua reverse the mental and functional slowdown—and allay the anxiety that accompanies depression. "...*it is rare to find a depress atie who does not also present definite symptoms of anxiety.*"[1]

'ron t symptomatic response: Somatic and mot nal target symptoms are reported to espc l promptly.[2-4] Insomnia, often the ıost nportant complaint in depression, is fter rst to be relieved.[2] (Bowes[5] found that ıe t nsient drowsiness sometimes caused y E AFON was generally beneficial to atie s.)

TRAF *offers the flexibility and convenience of 2 iditi il dosage strengths: (1) For more severe cases ith p ominant anxiety*—ETRAFON-FORTE *(amitrip- line Cl 25 mg. and perphenazine 4 mg.); (2) for ioles t or geriatric patients*—ETRAFON-A *(amitrip- line Cl 10 mg. and perphenazine 4 mg.).* S-915

More certain broad-spectrum relief: ETRAFON is a broad-spectrum psychotherapeutic agent, capable of symptomatic relief not achieved with either drug alone in mixed emotional disorders. Pennington[6] states: "Since neurotic and psychotic anxiety and depression are simultaneously present in varying degrees, these two types of phrenotropic drugs in combination are more effective than either alone." Dorfman[7] and Coffee[4] report that patients unimproved on amitriptyline alone have responded to the combined therapy.

Low incidence of side effects: Mattey[8] ports that with ETRAFON "Side effects a relatively few...." Another investigato states that side effects with amitriptylir perphenazine combination are less than wi each component alone. In Penningtor study of 428 patients, side reactions we less than half as frequent with ETRAFON with perphenazine alone, toxicity was lo and the absence of extrapyramidal sym toms was regarded as "...particularly no worthy."[6]

NEW ETRAFON

natomy of
ow Back Pain #1

the sedentary life is often the seat of low back pain

The human spine is not engineered for prolonged sitting at desks, pianos, typewriters and drafting boards. The stresses set up by the heavy, forward-tilted head and trunk, balanced precariously on an insufficient base, result in strain of the dorsal musculature, particularly at the low lumbar level.

The unusual muscle-relaxant and analgesic properties of 'Soma' make it especially useful in the treatment of low back sprains and strains. 'Soma' is widely prescribed ☐ **to relieve pain** ☐ **to relax muscles** ☐ **to restore mobility.**

Indications: 'Soma' is useful for management of muscle spasm, pain, and stiffness in a variety of inflammatory, traumatic, and degenerative musculoskeletal conditions. It also may act to normalize motor activity in certain neurologic disturbances.

Contraindications: Allergic or idiosyncratic reactions to carisoprodol.

Precautions: 'Soma', like other central nervous system depressants, should be used with caution in patients with known propensity for taking excessive quantities of drugs and in patients with known sensitivity to compounds of similar chemical structure, e.g., meprobamate.

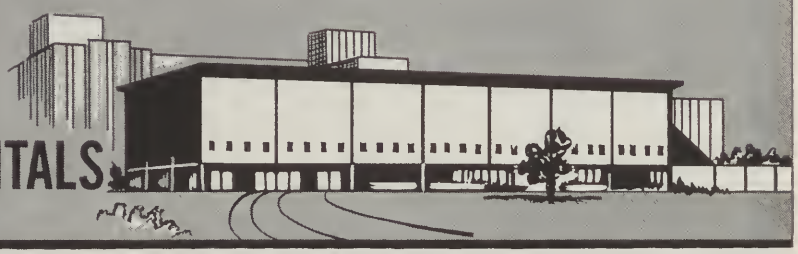
Side Effects: The only side effect reported with any frequency is sleepiness, usually on higher than recommended doses. An occasional patient may not tolerate carisoprodol because of an individual reaction, such as a sensation of weakness. Other rarely observed reactions have included dizziness, ataxia, tremor, agitation, irritability, headache, increase in eosinophil count, flushing of face, and gastrointestinal symptoms.

One instance each of pancytopenia and leukopenia, occurring when carisoprodol was administered with other drugs, has been reported, as has an instance of fixed drug eruption with carisoprodol and subsequent cross reaction to meprobamate. Rare allergic reactions, usually mild, have included one case each of anaphylactoid reaction with mild shock and angioneurotic edema with respiratory difficulty, both reversed with appropriate therapy. In cases of allergic or hypersensitivity reactions, carisoprodol should be discontinued and appropriate therapy initiated. Suicidal attempts may produce coma and/or mild shock and respiratory depression.

Dosage: Usual adult dose is one 350 mg. tablet three times daily and at bedtime.

Supplied: Two Strengths: 350 mg. white tablets and 250 mg. orange, two-piece capsules.

Before prescribing, consult package circular.



for the relief of low back sprains and strains

SOMA®
(CARISOPRODOL)

Wallace Laboratories, Cranbury, N.J.

HISTORY OF THE BALTIMORE CITY HOSPITALS

BY DOUGLAS CARROLL, M.D.

Chapter 3.— The Almshouse at Calverton: The Beginning of Social Medicine (1822-1840)

Every one of these establishments (jail, penitentiary, insane asylum, and almshouse), appeared to be strongly marked with the effects of that active desire to contribute to the wants of the wretched, which we met with in all parts of America, but in no place more conspicuously than Baltimore (1830).[1]

The new Almshouse was located in the area now bounded by Pulaski, Presstman, Lexington, and Franklin Streets. Although it had formerly been the country seat of the Smith family, a worse location could hardly have been found, from the point of view of public health, sewage disposal, and mosquito-borne disease. Calverton was a large private dwelling improved by two wings, 130 by 40 feet each. On December 2, 1822, 533 paupers were moved to the new Almshouse. Its major purpose remained the care of the infirm, orphans, paupers, the insane, and vagrants. In 1823, the first patients were sent there because of sickness.

State of Medical Practice at Calverton

The state of medical practice in this period was little better than in the time of Galen (130-200 AD). Physical examination consisted of palpation of the pulse, and the laboratory work consisted of looking at the urine in sunlight. Tuberculosis, malaria, dysentery, typhoid, and typhus could not be differentiated by any objective laboratory test. In 1831, a great influx of sick immigrants put an increased burden on the Almshouse.

Dr. T. H. Buckler[2] (1812-1901) described the Almshouse at this period:

> A single case of erysipelas brought to the house would often in a very short time spread the infection to all the other wards, rendering it dangerous to perform the most simple operation, even that of bleeding. It was not unusual to see in the same ward, at the same time, cases of typhoid fever, erysipelas, dysentery, and typhus or ship fever. Every summer the children suffered from cholera infantum, and where they escaped this disease, they were almost sure to perish in the winter with pneumonia. In the whole history of the establishment, there is no single example of a foundling that lived to the age of three years.

A cholera epidemic in 1832 killed 125 of 502 people in the Almshouse in a period of two weeks.

Reporting in 1828, the trustees stated that the Almshouse must be an infirmary for the indigent sick, a lying-in hospital for the indigent, a workhouse for vagrants, and asylum for destitute children, a lunatic hospital, and a medical and surgical school. One can well imagine the bedlam.

Some Advanced Views of Medical Care

Phillipe Pinel (1755-1826) in France and William Tuke (1732-1822) in England were leaders in improving the care of the mentally ill by "moral treatment." In America, it was Benjamin Rush (1745-1813), steeped in the liberal writings of John Locke (1632-1704), who did much to stimulate concerned interest in mental illness.

The Maryland Hospital at Baltimore (which became a state insane asylum in 1828) was one of four hospitals in the United States which

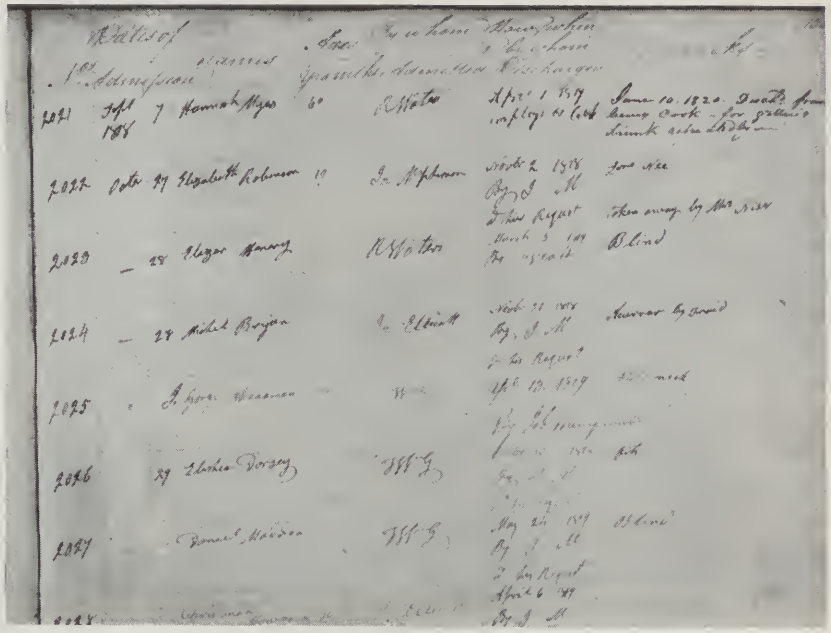


Fig 1
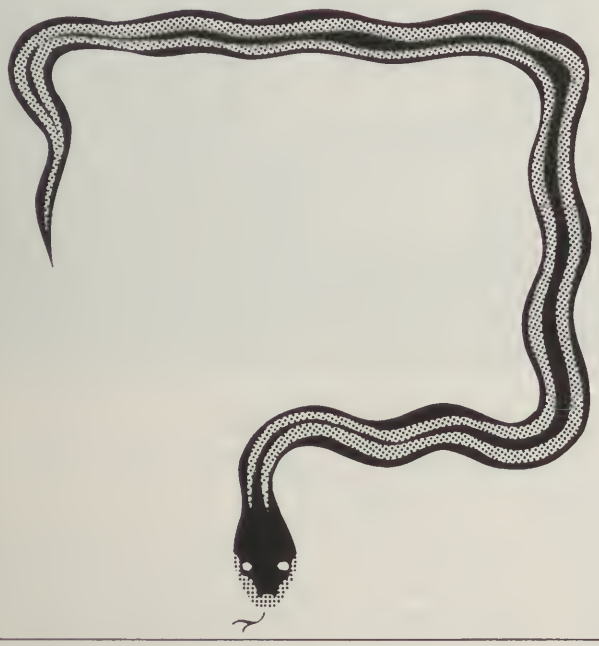
Almshouse Admission Book, September, 1818.

Fig 2
The Almshouse, Calverton. Fielding Lucas, 1832. (Original in Maryland Historical Society)



accepted mentally ill patients at the beginning of the nineteenth century. These patients were treated in spacious, well-lighted rooms with good food and by physicians informed by the moral treatment movement.[3] "Moral" meant psychological or non-organic. Although Plato had understood human behavior in terms of the person's situation, heredity, and education, this insight gave way, during the Dark Ages, to a demonic and essentially irrational interpretation of mental illness. The new scientific and humanitarian attitudes adopted in the eighteenth century involved the belief that behavior was based on natural law rather than possession by demons. Both humanism and scientific thought suggested that the individual did not have complete control over natural law. Therefore, there was no absolute standard of individual responsibility, and men were not completely responsible for their actions. These attitudes led to more humanitarian treatment of criminals, paupers, and the psychotic insane.

Some diagnoses made at the Almshouse in 1829 were "disappointed affection," "indulgence of passion and pride," and "religious perplexity." These were moral, or psychological, diagnoses and suggest that the care of the insane at the Almshouse at this period was humane, sophisticated, and modern.

Other broader influences were at work. In the 1830's, America was rapidly developing a new liberal philosophy of the individual. American thinkers were turning to nature in search of

"In 40 of 44 cases of irritable or spastic colon, Cantil [mepenzolate bromide] or Cantil with Phenobarbital reduced or abolished abdominal pain, diarrhea and distention and promoted restoration of normal bowel function . . . Cantil [mepenzolate bromide] proved to be singularly free of anticholinergic side-effects . . . Urinary retention, noted in two cases was eliminated in one by reducing dosage."[1]

CHARMS THE HYPERACTIVE COLON

CANTIL®

(mepenzolate bromide)

helps restore normal motility and tone

IN BRIEF:

One or two tablets three times a day and one or two at bedtime usually provide prompt relief. Cantil with Phenobarbital may be prescribed if sedation is required.

Dryness of the mouth or blurring of vision may occur but it is usually mild and transitory. Urinary retention is rare. Caution should be observed in prostatic hypertrophy—withhold in glaucoma. Cantil with Phenobarbital is contraindicated in patients sensitive to phenobarbital.

Supplied: CANTIL (mepenzolate bromide) —25 mg. per scored tablet. Bottles of 100 and 250. CANTIL with PHENOBARBITAL —containing in each scored tablet 16 mg. phenobarbital (warning: may be habit forming) and 25 mg. mepenzolate bromide. Bottles of 100 and 250.

1. Riese, J.A.: Amer. J. Gastroent. 28:541 (Nov.) 1957

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

LAKESIDE | PRODUCTS FOR PATIENTS YOU SEE EVERY DAY

truth. Societies for the abolition of slavery were being formed. Experiments in communal living were underway. New England Puritanism was growing milder. Leaders with social vision and humanistic ideals were rising to social leadership. Benjamin Franklin, Thomas Jefferson, Thomas Payne, and later Emerson, Channing, and Samuel Gridley Howell created a prevailing spirit of humanistic ideals and interest in human problems.

During the late 1820's it became evident that Baltimore City was unable to take care of the large number of insane being sent to the Almshouse. The state began to take care of a few of the insane. Over the next century this need remained unmet until a system of state mental hospitals was organized.

Social Factors in Pauperism and Disease

About 1825, the trustees of the poor took under consideration the large population of able-bodied paupers in the Almshouse. Of 623 adults admitted in 1825, 554 were found to be reduced to poverty by drunkenness. The trustees attributed pauperism largely to alcoholism. Several later surveys showed that a great majority of the children admitted for non-support or broken families had alcoholic parents.

The alcoholic theory of poverty was not entirely satisfactory as an explanation of indigency. The social and individual psychological causes of alcoholism were not considered. The alcoholic theory of indigency allowed Puritan moralism and judgment to replace objective consideration of the problems of the Almshouse inmates. The theory allowed the trustees to be satisfied with the Almshouse as it was. A similar attitude was being reflected in the English Reform Bill of 1832 and the Poor Law of 1834, by which workhouses were established and paupers were required to choose between what amounted to the punishment of the workhouse or starvation. In America, the view that the poor were largely responsible for their poverty was supported by the Puritan heresy, peculiarly identified with the American rugged individualistic "self-made" man, that God is identified with human success, and that indigency is the result of moral failure.

In 1828 and 1829, the trustees noted that the liberal admitting policies of the Almshouse had drawn paupers from neighboring counties as well as Pennsylvania and Virginia. They attempted to tighten the admitting policies of the Almshouse.

In the 1830's began tremendous immigrations from Nova Scotia, Germany, and Ireland. Many of these immigrants were sick on arrival and had to be taken care of in the Almshouse. The plight of such people was recognized by the Trustees of the Poor, and they were accepted without question. It is apparent that in many cases the city of origin of the immigrants had paid their passage to Baltimore to get rid of them because they were a burden on the community from which they came. Although the law required residence of about a year before people were eligible for Almshouse admission, these eligibility requirements were swept aside because of the large number of sick immigrants. Many patients were admitted to the Almshouse directly from the ships on which they had arrived.

In the surveys made by the trustees of the place of residence of people being admitted to the Almshouse, we see the beginning of "scientific philanthropy," the investigation of each case individually. The search as to the origin and cause of the person's poverty was an effort in the same direction. Although alcoholism was probably a simplified answer as to the cause of poverty, the effort to find a cause and the division of inmates into the "deserving" and "undeserving" poor was a step in the development of modern social work and its principal tool, casework. The deserving poor, such as the insane and children, were given special consideration and were treated as special groups either by the state or by private charities.

During the years 1822 to 1840, the cost of the Almshouse seemed to be the major point of orientation. It was run cheaply and efficiently largely because of the cheap vagrant labor available for the farming operation.

Thus, although epidemics flourished, there was growing interest in the causes of poverty, in psychological treatment, and in the financial integrity of the Almshouse.

more complete relief for the "dyspeptic"

DACTILASE®

Dactilase provides comprehensive therapy for a wide range of digestive disorders. Its antispasmodic and anesthetic actions rapidly relieve pain and spasm. Dactilase decreases hypermotility without inducing stasis. In addition, it supplies digestive enzymes to help reduce bloating, belching and flatulence. Dactilase does not interfere with normal digestive secretions. Very often it can be a most useful answer to the dyspeptic's needs.

DACTILASE: Each tablet contains: Dactil® (piperidolate hydrochloride), 50 mg.; Standardized cellulolytic* enzyme, 2 mg.; Standardized amylolytic enzyme, 15 mg.; Standardized proteolytic enzyme, 10 mg.; Pancreatin 3X** (source of lipolytic activity), 100 mg.; Taurocholic acid, 15 mg.

*Need in human nutrition not established. **As acid resistant granules equivalent in activity to 300 mg. Pancreatin N.F.

Side Effects and Contraindications: DACTILASE is almost entirely free of side effects. However, it should be withheld in glaucoma and in jaundice due to complete biliary obstruction.

Administration and Dosage: One tablet with, or immediately following each meal. Tablets should be swallowed whole.

Supplied: Bottles of 60 and 250.

COMPONENT MEDICAL SOCIETIES

BALTIMORE COUNTY

Baltimore County General Hospital was host to the Baltimore County Medical Association and Woman's Auxiliary on January 19. **John Sargeant,** executive secretary of the Medical and Chirurgical Faculty, spoke on "1966 Legislative Prognostications." He said that at least four bills of interest to physicians will be introduced in the State Legislature. The details of these bills can be found in *The Assemblyman,* published by the Faculty. He also reported that in conjunction with Medicare, Blue Shield will probably introduce a supplemental program costing about $2 a month for persons over 65 to cover the deductible part of Medicare.

President Edward L. Krieg introduced **William G. Esmond, MD,** who plans to initiate an intermittent hemodialysis clinic at St. Joseph's Hospital. The Association endorsed this program.

Baltasar Velez, MD, and **Everett Diggs, MD,** were welcomed as new members.

Raymond Cunningham, MD, chairman of the Hospital Coordinating Council, reported that he had written letters to representatives of three hospitals in Baltimore County suggesting that they have their staff meetings and invite other hospital staffs to attend so that physicians would not be required to attend so many staff sessions.

The President stated that he has had many requests for speakers for PTA meetings, Health Career Days, etc., and he appointed **Frank Faraino, MD,** to organize a Speaker's Bureau.

The matter of the special assessment was brought up. Dr. Krieg read from the Faculty Bylaws, which states that anyone not paying the special assessment will be dropped from membership as of March 1, 1966.

Gordon Grau, MD, program chairman, announced that the February meeting would be held at the Western Electric complex in the Industrial Park near Cockeysville. **Samuel Bacon, MD,** medical director of the Western Electric plant, will arrange the program.

John Snyder, MD, chairman of the Board of Governors, reported a good response to our request to the component societies of the Faculty that they write to the Medical and Chirurgical Faculty to request the Medical Care Council to include in its budget enough money to pay the "usual and prevailing fee" for the treatment of the medically indigent in Maryland.

when even southern sun fails to warm cold hands and feet

provide rapid, sustained vasodilation for warmth and relief of pain, dizziness and faintness in patients with impaired peripheral circulation

GERILIQUID warms cold hands and feet through the thermogenic action of glycine and through sustained vasodilation by glycine and niacin. In addition, in patients with impaired peripheral circulation, GERILIQUID increases the ability to walk farther with less pain. Patients particularly like the palatable, sherry wine base.

Geriliquid®

IN BRIEF: Composition: Each 5 ml. contains: niacin 75 mg. and aminoacetic acid (glycine) 750 mg. in a palatable sherry wine base; alcohol 5%.

Side Effects: Occasional lightheadedness or transient itching which may disappear with continued use. There are no known contraindications; however, caution is advised when there is concomitant administration of a coronary vasodilator.

Administration and Dosage: One or two teaspoonfuls 3 times a day before meals. If flushing is objectionable, dosage may be lowered. However, tolerance to flushing usually develops without loss of efficacy in regard to vasodilation.

Supplied: Bottles of 8 oz. and 16 oz.

LAKESIDE LABORATORIES, INC. Milwaukee, Wisconsin 53201

WASHINGTON COUNTY

Education for premedical students, practicing physicians, and medical technologists was on the agenda of the January meeting of the Washington County Medical Society.

Donald Benson, MD, professor of anesthesiology at The Johns Hopkins University Medical School and anesthetist-in-charge at Johns Hopkins Hospital, discussed "Cardiopulmonary Resuscitation" to the group of more than 70 physicians and 16 nurses.

Plans to allot $1,200 a year for scholarships were approved. Each year a local student will be selected to receive an annual scholarship of $300 to be used in the undergraduate premedical training. This will continue during the four years of college. In addition, another student will be selected each year to receive the same amount. The current recipient is Norman Haines of Boonsboro, a sophomore at The Johns Hopkins University.

To overcome the acute shortage of properly qualified medical technologists, **Fred Shillinger, MD,** pathologist at the Washington County Hospital and a member of the society's Public Health and Legislation Committee, presented a resolution to be acted on by Med-Chi. He recommended that a program be instituted in the state to train people so vitally needed in hospitals.

The first in a series of awards to be presented to local laymen was given to Mrs. Vi Birdsall, owner of the Physicians Answering Service in Hagerstown. The framed certificate was awarded "for outstanding service by a layman to the field of medicine."

State legislators from Washington County were guests at a luncheon meeting held in early January by the Public Health and Legislation Committee.

Jack Beachley, MD, chairman, led the discussion of current medical legislation being considered for the current session of the legislature.

WHEN MOTHER'S IRON ISN'T UP TO MOTHERHOOD

IN BRIEF: **ACTIONS AND USES:** A single dose of Imferon (iron dextran injection) will measurably begin to raise hemoglobin and a complete course of therapy will effectively rebuild iron reserves. The drug is indicated only for specifically-diagnosed cases of iron deficiency anemia and then only when oral administration of iron is ineffective or impractical. Such iron deficiency anemia may include: patients in the last trimester of pregnancy; patients with gastrointestinal disease or those recovering from gastrointestinal surgery; patients with chronic bleeding with continual and extensive iron losses not rapidly replenishable with oral iron; patients intolerant of blood transfusion *as a source of iron;* infants with hypochromic anemia; patients who cannot be relied upon to take oral iron.

COMPOSITION: Imferon (Iron dextran injection) is a well-tolerated solution of iron dextran complex providing an equivalent of 50 mg. of elemental iron in each cc. The solution contains 0.9% sodium chloride and has a pH of 5.2-6.0. The 10 cc. vial contains 0.5% phenol as a preservative.

ADMINISTRATION AND DOSAGE: Dosage, based upon body weight and Gm. Hb./100 cc. of blood, ranges from 0.5 cc. in infants to 5.0 cc. in adults, daily, every other day, or weekly. The total iron requirement for the individual patient is readily obtainable from the dosage chart in the package insert. Deep intramuscular injection in the upper outer quadrant of the buttock, using a Z-track technique, (with displacement of the skin laterally prior to injection), insures absorption and will help avoid staining of the skin. A 2-inch needle is recommended for the adult of average size.

SIDE EFFECTS: Local and systemic side effects are few. Staining of the skin may occur. Excessive dosage, beyond the calculated need, may cause hemosiderosis. Although allergic or anaphylactoid reactions are not common, occasional severe reactions have been observed, including three fatal reactions which may have been due to Imferon (iron dextran injection). Urticaria, arthralgia, lymphadenopathy, nausea, headache, and fever have occasionally been reported. Initial test doses of 0.5 cc. are advisable.

PRECAUTIONS: If sensitivity to test doses is manifested, the drug should not be given. Imferon (Iron dextran injection) must be administered by deep intramuscular injection only. Inject only in the upper outer quadrant of the buttock, not in the arm or other exposed area.

CONTRAINDICATIONS: Imferon (iron dextran injection) is contraindicated in patients sensitive to iron dextran complex. Since its use is intended for the treatment of iron deficiency anemia only, it is contraindicated in other anemias.

CARCINOGENICITY POTENTIAL: Using relatively massive doses, Imferon (iron dextran injection) has been shown to produce sarcoma in rats, mice and rabbits and possibly in hamsters, but not in guinea pigs. The risk of carcinogenesis, if any in man, following recommended therapy with Imferon (iron dextran injection) appears to be extremely small.

SUPPLIED: 2 cc. ampuls, boxes of 10; 5 cc. ampuls, boxes of 4; 10 cc. multiple dose vials.

Richard A. Young, MD, presented a pin to George Kohler, MD, Smithsburg, for 50 years of membership in the Society. Since opening his office in 1913, Dr. Kohler has delivered 5,423 babies. He has one more to deliver this spring, the fourth generation in one family.

reau, participating in the Health Fair in November, holding a seminar on the health aspects of sports for scholastic coaches and trainers, to be held in the spring, and distributing AMA pamphlets and a roster of physicians to newcomers through the Welcome Wagon.

Also planned are a program of support and publicity for the local ambulance services, an advisory board of physicians to assist the Board of Education, awards to laymen who have performed outstanding service to medicine, and completion of a code for news media.

The society has opened an office in the old nurses home of the Washington County Hospital. The executive secretary will have office hours there daily. This will be not only a place for the transaction of society business but also a meeting place for the Executive Committee of both the society and the Woman's Auxiliary.

Mrs. Joyce Harlacher

METAHYDRIN (trichlormethiazide) is prescribed by physicians because it not only approximates the diuretic efficacy of parenteral meralluride injection . . . but, *it is the least expensive of all "brand-name" thiazides.* Therefore, when you prescribe METAHYDRIN (trichlormethiazide) your patients receive the thiazide diuretic that removes a little more salt and water than earlier thiazides, with relatively less loss of potassium . . . and, it's therapy they can more easily afford . . . *only pennies a day.*

METAHYDRIN®

(trichlormethiazide)

oral diuretic

Dosage: One 2 or 4 mg. tablet once or twice daily.

Precautions: As with all effective diuretics, vigorous therapy may produce electrolyte depletion. Patients with severely reduced renal function should be observed carefully since thiazides may be contraindicated. Care should be taken with patients predisposed to diabetes or gout. Patients with a tendency to potassium deficiency, as in hepatic cirrhosis or diarrheal syndromes, or those under therapy with digitalis, ACTH, or certain adrenal steroids, also should be watched carefully.

Side Effects: Nausea, flushing, constipation, skin rash, muscle cramps and gastric discomfort have occasionally been noted; rarely thrombocytopenia and bone marrow depression, photosensitivity, cholestatic jaundice, pancreatitis, perimacular edema, gout and diabetes have been caused by the administration of thiazides.

Contraindications: Complete renal shutdown; rising azotemia or development of hyperkalemia or acidosis in severe renal disease; demonstrated hypersensitivity.

How Supplied: Bottles of 100 and 1000 tablets.

WICOMICO COUNTY

Edward R. Annis, MD, immediate past president of the AMA, was guest at the January meeting of the Wicomico County Medical Society, Inc. Speaking to an audience of more than 100, Dr. Annis exhorted physicians to become "more active citizens" and reminded them that unless they participate in establishing rules and regulations for Medicare, someone else will.

Reviewing the many activities of the AMA in scientific and educational fields, Dr. Annis said that the rapid funneling of legislative and other information to the county level is not a feasible project for that organization. To provide a mechanism for this purpose and to offer a forum where county medical society problems can be discussed, the Congress of County Medical Societies was formed. Far from competing with AMA, the Congress proposes to supplement AMA's work at the county component level.

Dr. Annis was introduced by **Andrew C. Mitchell, MD,** immediate past president of the Wicomico County Medical Society. The meeting was conducted by **Charles Bagley III, MD,** president. Arrangements for the dinner, which was held in the auditorium of the Peninsula General Hospital School of Nursing, were made by the Woman's Auxiliary to the Wicomico County Medical Society, of which **Mrs. William C. Morgan** is president.

Guests at the meeting included members' wives, representatives of local news media, presidents of several Eastern Shore medical societies, and representatives of the Peninsula General Hospital.

While in Salisbury, Dr. Annis also spoke on sex education before three groups of high school students and made appearances on television and radio.

BRING IT DOWN AND KEEP IT DOWN

Metatensin lowers blood pressure and keeps it low—effectively and economically. It combines reserpine with trichlormethiazide which affords more potent saluresis with less loss of potassium than from earlier thiazides. Reserpine contributes antihypertensive effect by relieving anxiety and tension. Metatensin is well-tolerated over long periods; with its effectiveness and economy it assures antihypertensive therapy you and your patients can stay with.

METATENSIN®

Each scored tablet contains:
METAHYDRIN® (trichlormethiazide)
2 mg. or 4 mg. and
Reserpine 0.1 mg.

Usual adult dose: One tablet twice daily. **Precautions and side effects:** Patients with hepatic cirrhosis or diarrheal syndromes, or under therapy with digitalis, ACTH, or potassium-losing steroids, should be observed for signs of hypokalemia. With thiazides, electrolyte depletion, diabetes, gout, granulopenia, nausea, pancreatitis, cholestatic jaundice, flushing, mild muscle cramps, constipation, photosensitivity, acute myopia, perimacular edema, paresthesias, neonatal bone marrow depression in infants of mothers who received thiazides during pregnancy, skin rash or purpura with or without thrombocytopenia, may occur. With reserpine, untoward effects may include depression, peptic ulcer and bronchial asthma. Withdraw medication at least 7 days prior to electroshock therapy, 2 weeks prior to elective surgery.

Contraindications: Complete renal shutdown, rising azotemia or development of hyperkalemia or acidosis in severe renal disease.

Supplied: Metatensin tablets, 2 mg., 4 mg.—bottles of 100 and 1000.

MITCHELL ROSENHOLTZ, MD, *Chairman, Editorial Committee*

THE POST MORTEM EXAMINATION TO BE (USEFUL) OR NOT TO BE!

A REBUTTAL

W. BRADLEY KING, JR., MD

In an illuminating symposium on the autopsy, published in the September 6, 1965, issue of the *Journal of the American Medical Association,* the autopsy was dissected and its usefulness assessed. The approaches were several: its importance in the molecular age, its significance as a research tool, its general use, and its problems and proposed solutions.

The principal complaint about the autopsy (probably not as good a term as *post mortem examination,* which etymologically has a broader interpretation) has been its apparent inability to keep pace with the increasingly sophisticated and specific techniques of diagnosis and therapy, ie, its failure to change its methods significantly since the days of Virchow and Rokitansky. Thus, in the face of fancy gadgets and elaborate clinical determinations in diagnostic or therapeutic maneuvers, it has lost face—though in no way being different in this regard than the time-honored techniques of history-taking and physical examination, which also have changed but little.

To imply that the post mortem examination has been stagnant is to avoid the many morphologic discoveries, such as the recent establishment of alveolar proteinosis as a disease entity; to overlook its position in the understanding of the anatomic changes in many biochemical aberrations, such as hypo- and hyperkalemia; or to ignore its anatomic verification of sites of virus-induced lesions, such as that of Coxsackie B myocarditis.

A maxim taught early in one's training in pathology is that it is difficult to transpose accurately and consistently structural changes into function. But even this "failing" is weakening with the advent of the newer ancillary laboratory techniques of post mortem examination, such as electron microscopy, cytology, immunology, microbiology, toxicology, histochemistry, cytogenetics, and virology injection studies. The big problem seems to be the apparent failure to use such techniques in the autopsy examination.

Recognizing that these techniques are not being used as often as may be desired is to avoid some obvious problems intrinsic to the examination of a dead body: virtually all the biochemical components of the body become so modified after death that tests for them are no longer reliable, and microbiologic studies are apt to be complicated by post mortem invaders. Even such an apparently simple determination as the time of death cannot be made with accuracy. Frequently, the elapse of time between death and the actual performance of the post mortem examination further magnifies these problems.

Lack of time causes additional problems. The increasing dominance of clinical pathology in the professional life of the practicing pathologist, as well as the short supply of pathologists, are two of several explanations. But academic pathologists, too, are frequently unable to do as thorough a job on the post mortem examination as might be possible. So, even with newer techniques available, there is not enough time to use them. The lack of pathologists, however, is not the whole story. Adequate paramedical personnel

a rapid lift from the hell of depression

Doré Illustration
from
Dante's Inferno

often relieves mental pain in 2-5 days

NORPRAMIN®
(desipramine hydrochloride)

Norpramin is a rapid-acting specific drug for the treatment of depression. Depressive signs and symptoms—sometimes described as "mental pain"—typically begin to improve in 2-5 days. Patients are more hopeful, less empty and less weighed down by their troubles. Norpramin has only slight sedative qualities, nevertheless anxiety *secondary to depression* is frequently relieved as depression is lifted. If anxiety or tension persists it can be controlled by adding a tranquilizer or by reducing dosage. Norpramin is not a MAO inhibitor. Side effects are usually mild.

DOSAGE AND ADMINISTRATION

Optimal results are obtained at a dosage of about 150 mg./day—two 25 mg. tablets t.i.d. After achieving optimal results, a maintenance dose (50-100 mg./day) should be sought.

LAKESIDE LABORATORIES, INC. Milwaukee, Wisconsin 53201

IN BRIEF:

Indications: In depression of any kind—neurotic and psychotic depressive reactions; manic-depressive or involutional psychotic reactions.

Contraindications and Precautions: Glaucoma, urethral or ureteral spasm, recent myocardial infarction, severe coronary heart disease and epilepsy. Should not be given within two weeks of treatment with a monoamine oxidase inhibitor. Safety in human pregnancy has not been established.

Adverse Effects: Side effects, usually mild, may include: dry mouth, constipation, dizziness, palpitation, delayed urination, "bad taste," sensory illusion, tinnitus, agitation and stimulation, sweating, drowsiness, headache, orthostatic hypotension, flushing, nausea, cramps, weakness, blurred vision and mydriasis, rash, allergy, transient eosinophilia, granulopenia, altered liver function, ataxia and extrapyramidal signs.

Supplied: Norpramin (desipramine hydrochloride) tablets of 25 mg., in bottles of 50, 500 and 1000.

For Physicians Offices

. . . the perfect building
. . . the perfect location

Ten-Ten is a new building which has already established itself as a prestige address. As a professional office location it is ideal. Ten-Ten is situated in the very midst of an already professional neighborhood and is outstanding in both appearance and facility. It offers your patients nearby convenient parking facilities and bus transportation stops at the door. No wonder it has been judged by many as the "perfect professional location" for physicians. Your personal investigation will bear this out to your complete satisfaction.

FEATURING:

- One of downtown's most attractive rental prices.
- Individually designed office suites, 400 sq. ft. and up.
- Private lavatory in each suite.
- Modern automatic elevator service.
- Attractive lobby with reception desk.
- 24-hours-a-day switchboard secretarial service.
- Convenient parking, eating places and other personal services.

EDWARD A. MYERBERG CO.

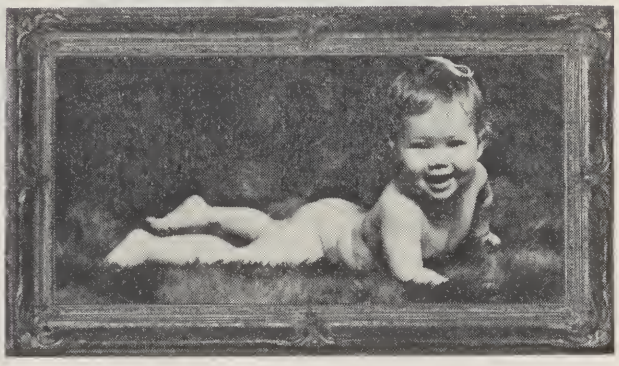
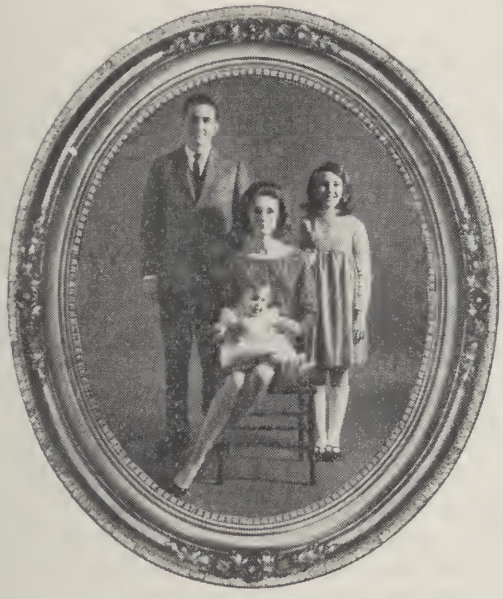
Main office: VE 7-2900 24 hour phone: SA 7-3888

are so scarce that even in the rare event of having equipment, space, time, and the inclination, there still may not be enough people to do this additional work. Now and in the future, with the ever-increasing need for laboratory technologists and technicians to keep up with the demands of rapidly growing clinical laboratories, having enough technical personnel to carry out this autopsy work may be almost impossible.



One of the most discouraging things is that often the most pathologically interesting cases have minimal or inadequate clinical workups. This is every bit as frustrating as having a clinically well worked-up case in which the anatomic pathologic findings are minimal or inadequate to explain the changes perplexing the clinicians. Apropos of this, some autopsies are so limited by permission or so rushed that the pathologist may be restricted to the simplest techniques.

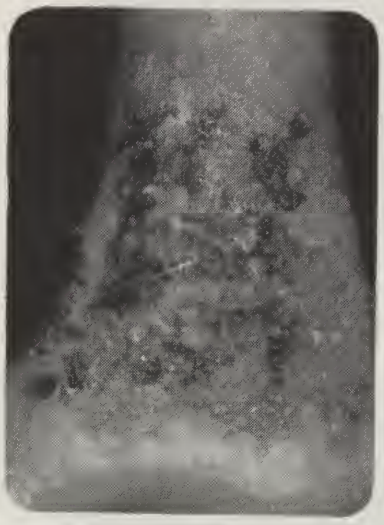


In summary: 1) The post mortem examination is still useful, for even though many autopsies are performed with the most "ancient" techniques, and perhaps even under adverse circumstances, they still may provide information not available by *any other* diagnostic maneuver (and the medical examiner case is noteworthy here). 2) Pathologists have serious problems: lack of time, personnel, equipment, space, and funds, which impede their doing what might be considered the ideal post mortem examination. 3) Post mortem changes in the body anatomy and chemistry preclude many determinations possible during life. 4) There is a real need for more thorough clinical workups on many patients, with more thoughtful laboratory (clinical, cardiopulmonary, radio-isotope, etc.) determinations not restricted by lack of patient or hospital funds (but, rather, perhaps subsidized by research monies), which not only will aid the patient who is to recover but also will provide information for the post mortem pathologist in the event of therapeutic failure.

Turn a bundle of colic

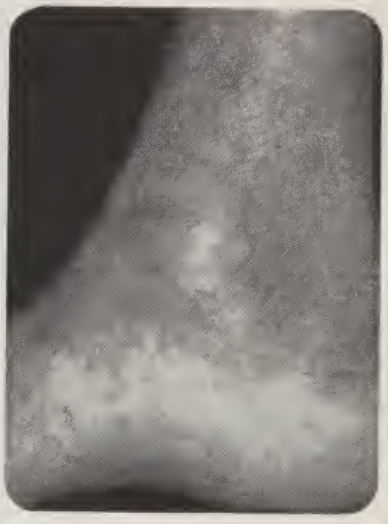
into a bundle of joy

COLIC, often in part a reflection of family tension, adds sleepless nights to patients' and parents' distraught days. Pediatric Piptal with Phenobarbital slows down spasm, diminishes pain and crying, improves feeding patterns . . . permits sleep and rest . . . for patient and family.



Pleasant tasting Pediatric Piptal with Phenobarbital is miscible in milk, formulas and fruit juices, and may also be administered by dropper directly on the infant's tongue. Dosage is 0.5 cc. 15 minutes before feeding; in severe cases, 1.0 cc. four times daily. High doses may occasionally cause constipation with tenesmus and, rarely, flushing without fever. Contraindicated in bowel obstruction or sensitivity to phenobarbital or anticholinergics. Available in 30 cc. dropper bottles, droppers calibrated to deliver 0.5 cc.

PEDIATRIC PIPTAL® WITH PHENOBARBITAL



each cc. contains: 6 mg. phenobarbital (warning: may be habit forming); 4 mg. Piptal® (pipenzolate bromide), and 20% alcohol in a pleasant-tasting solution.

LAKESIDE LABORATORIES, INC.
Milwaukee, Wisconsin 53201

eczema: scourge of childhood

R. R., Age 11—Before treatment—atopic eczema of long standing

After treatment—with ARISTOCORT Topical Ointment 0.1% for two weeks

ARISTOCORT® Triamcinolone Acetonide Topicals have proved exceptionally effective in the control of various forms of childhood eczema: allergic, atopic, nummular, psoriatic, and mycotic.

In most cases responsive to topical ARISTOCORT, the 0.1% concentration is sufficiently potent. The 0.5% concentration provides enhanced topical activity for patients requiring additional potency for proper relief.

Administration and Dosage: Apply sparingly to the affected area 3 or 4 times daily. Some cases of psoriasis may be more effectively treated if the 0.1% Cream or Ointment is applied under an occlusive dressing.

Contraindications: Tuberculosis of the skin, herpes simplex, chicken pox and vaccinia.

Precautions and Side Effects: Do not use in the eyes or in the ear (if drum is perforated). A few individuals react unfavorably under certain conditions. If side effects are encountered, the drug should be discontinued and appropriate measures taken. Use on infected areas should be attende with caution and observation, bearing in mind the potentia spreading of infection and the advisability of discontinuin therapy and/or initiating antibacterial measures. Generalize dermatological conditions may require systemic corticoste oid therapy. Steroid therapy, although responsible for remis sions of dermatoses, especially of allergic origin cannot be ex pected to prevent recurrence. The use over extensive bod areas, with or without occlusive nonpermeable dressings may result in systemic absorption. Appropriate precaution should be taken. When occlusive nonpermeable dressing are used, miliaria, folliculitis and pyodermas will sometime develop. Localized atrophy and striae have been reporte with the use of steroids by the occlusive technique. Whe occlusive nonpermeable dressings are used, the physicia should be aware of the hazards of suffocation and flamma bility. The safety of use on pregnant patients has not beer firmly established. Thus, do not use in large amounts or fo long periods of time on pregnant patients.

Packages: Tubes of 5 Gm. and 15 Gm.; ½ lb. jar.

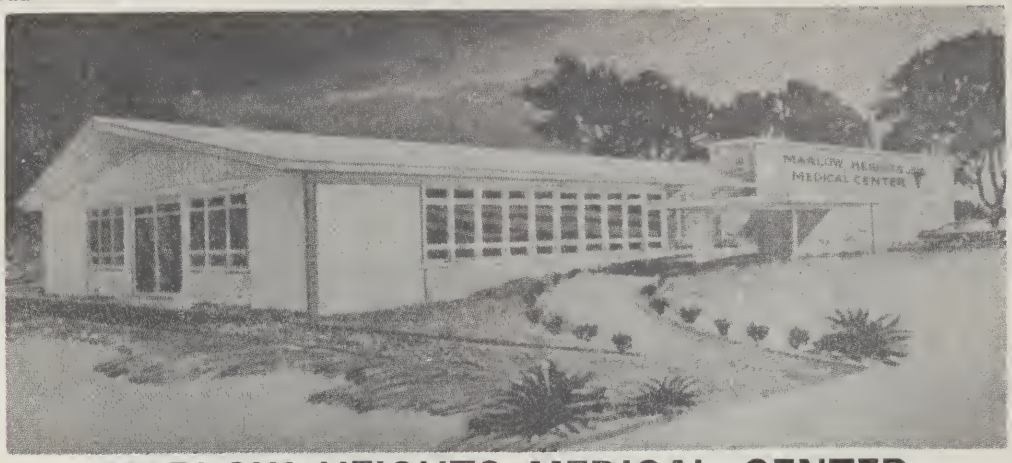
A SERVICE OF
THE HEART ASSOCIATION OF MARYLAND

VOCATIONAL REHABILITATION OF THE CARDIAC PATIENT

JACK R. NICHOLS

Vocational rehabilitation has the capacity for being the physician's culminating service to the cardiac convalescent. This program of counseling and employment exploration coupled with the physician's medical treatment can spell the difference between despair and hope for the recuperating cardiac patient.

The Division of Vocational Rehabilitation in Maryland is part of the State Department of Education. Its function is to evaluate, counsel, train, and place handicapped persons in jobs. The cooperation of the treating and consulting physicians is essential to the success of this program.



Only the physician, through his training and experience, is able to identify the physical restoration process of the recuperating cardiac patient. When this is relayed to the trained and experienced vocational rehabilitation counselor, it can be converted into meaningful job specifications and opportunities. As a liaison between medical services and employers, rehabilitation counseling may determine the difference between months or even years of inactivity and a gradual resumption of former occupational skills. The key is wholehearted cooperation between the physician and the vocational rehabilitation counselor. With a team effort, the cardiac patient can better look forward to a safe resumption of employment.

The patient with a cardiac history is one of the most difficult clients to rehabilitate successfully into remunerative employment. A tremendous amount of resistance must be overcome when employment opportunities are sought. Employers are afraid to employ former cardiac patients because they envision an uncertain future. Therefore, it is initially the job of the counselor to enlighten the employer about the cardiac patient who is being presented for employment. To do this the counselor needs to have the physician's evaluation of the patient and his limitations. From the physician's experience in dealing with many cardiac patients will come practical guidelines for each patient that he encounters. The counselor can use this information to obtain the best type of employment within the limitations of the disability.

A patient's return to employment is initially sought in some capacity related to his previous occupation. If the working conditions and demands can be altered so that he can return safely, quite often he can use skills that he already has. This results in a great conservation of skilled craftsmen and ordinarily insures a wage comparable to that earned before the onset of the disability.

When the patient is unable to return to his former employment because of the strenuous physical demands, the rehabilitation counselor attempts to help him use the existing skills in a related industry. Again this results in the conservation of the skill and, usually, a higher starting wage.

Mr. Nichols is district supervisor, Eastern Shore District, Division of Vocational Rehabilitation, State Department of Education.

MARLOW HEIGHTS MEDICAL CENTER

Adjacent to Capital Beltway

Suites available for immediate occupancy

A medical building striking in appearance and architectural design that meets the most demanding requirements of doctors and dentists for prestige, working efficiency and comfort.

GA-LA CORPORATION

4302 St. Barnabas Road, S.E. Washington, D. C. 20031 Phone 423-1423

When a person cannot return to some phase of his former employment, the vocational rehabilitation counselor then determines the potential and possibilities for retraining to develop a skill that will enable the cardiac patient to secure satisfactory job placement. If training is not indicated because of age, ability, or interest, direct placement efforts are initiated to effect employment in a job commensurate with the cardiac's physical capabilities.

Vocational rehabilitation thus offers to a physician an extension of his services to effect the total rehabilitation of his patient. Hopefully, the physician will welcome this assistance in counseling as his demands from acute illness necessarily limit his participation in detailed and continuous counseling of each recuperating cardiac. A close relationship should exist between the physician and the counselor so that employment demands can be appraised objectively in the light of each patient's physical condition. With this cooperation, a more orderly resumption of occupational duties will result, and a contributing member will be restored to society.

LEAFLET FOR SODIUM RESTRICTED PATIENTS

The first of three simplified leaflets based on the Heart Association's sodium-restricted diet booklets is now available to physicians and other professional workers. Like the booklets, it may be obtained by patients only if they present a physician's prescription. It is available from local Heart Associations.

Entitled "Sodium Restricted Diet, 500 Milligrams," the leaflet was developed in cooperation with the Heart Disease Control Program of the U. S. Public Health Service and The American Dietetic Association. Although the diet is the same, the leaflet contains less detail than the 56-page booklet from which it was adapted. Completely unfolded, it becomes a 20x14 inch chart suitable for posting in the kitchen. In addition to the daily diet plan and food lists, the leaflet carries important information on sources of sodium, shopping and cooking, eating out, and seasonings.

makes sleep irresistible

nidar®

EACH TABLET CONTAINS:

Pentobarbital Sodium	25 mg.
Secobarbital Sodium	25 mg.
Butabarbital Sodium	7.5 mg.
Phenobarbital	7.5 mg.

Sleep comes easy...lingers...departs naturally

Gentle doses of 4 barbiturates assure uninterrupted sleep

2 barbiturates act fast...in 20 to 30 minutes

2 long-range barbiturates come into play to sustain sleep for up to 8 hours

Tiny amounts of individual barbiturates means Nidar is well tolerated

Patients enjoy a refreshing, clear-headed wake-up

makes sleep irresistible

IN BRIEF:

EACH TABLET CONTAINS:

Pentobarbital Sodium	25 mg.
Secobarbital Sodium	25 mg.
Butabarbital Sodium	7.5 mg.
Phenobarbital	7.5 mg.

(WARNING: MAY BE HABIT FORMING)

Dosage: One or two tablets, one-half hour before bedtime.

Indications: For night-time sedation and refreshing sleep up to eight hours.

Contraindications: Patients sensitive to barbiturates. Use with caution in the presence of moderate to severe hepatic disease.

Supplied: Bottles of 100 tablets.

CAUTION: Federal law prohibits dispensing without a prescription.

REHABILITATION Notes

REHABILITATION SECTION
BALTIMORE CITY MEDICAL SOCIETY,

DOUGLAS G. CARROLL M.D.
EDITOR

THE HEART ASSOCIATION OF MARYLAND AND ITS CHAPTERS

Where patients with heart and circulatory diseases are concerned, the Heart Association of Maryland and its local chapters should be counted as a first resource. Chapters are located in Cumberland, Hagerstown, Frederick, Kensington, Riverdale, Bel Air, Easton, Salisbury, and Baltimore.

Most prominent among the services available to practicing physicians through the Heart Association are:

1. **Work Evaluation Unit.**—On physician referral, through his local Heart Association chapter, a patient is given an appointment for evaluation at this unit, located in Baltimore, to determine his work capacity in relationship to his occupational potential. There is no charge for this evaluation, which includes a medical work-up by a cardiologist, interviews and evaluations from a psychiatrist, vocational counselor, and medical social worker. After a joint team conference, a work prescription and recommendations are discussed with the patient and formally reported to the referring physician.

2. **Loan Closet.**—Sick room equipment such as hospital beds, bed sides, commodes, and wheelchairs are available through local Heart Association chapters if, in the opinion of the physician, it would create a hardship for the family to rent or purchase such equipment.

3. **Rheumatic Fever Prophylaxis.** — The Heart Association maintains a registry of rheumatic fever patients in Maryland. A physician may register such a patient by filling in a form provided by the Association. Patients who would find it a financial burden to pay the commercial rate for penicillin or sulfadiazine may be referred. Upon referral, the Heart Association sends a card to the patient which he uses in applying to the local pharmacy for low-cost penicillin. In this instance, also, the Heart Association relies upon the physician's judgment as to the patient's financial eligibility.

4. **Information Services.**—The Heart Association carries an up-to-date file on community resources for the cardiac patient. Information is available to physicians, their patients, and their families on such subjects as occupational therapy in the home, meals on wheels, financial assistance, and home nursing care. If a question is asked on which the Heart Association has no information, a concerted effort is made to find the answer.

5. **Educational and Informational Literature.**—Pamphlets, brochures, leaflets, and wall charts are available to the physician, upon request, to help him inform his patients and their families about the diagnosis, management, and prognosis. A catalog of these pub-

new from Ames
5 basic uro-analytical facts in 30 seconds

Labstix®

BRAND REAGENT STRIPS

...broadest urine screening possible from a single reagent strip

Urine test results with LABSTIX Reagent Strips can represent significant guides to differential diagnosis or therapy in many conditions. An unexpected "positive" may enable you to detect hidden pathology—long before more recognizable symptoms become evident. Negative results, which permit you to rule out abnormalities in a broad clinical range, can serve as baseline values for reference in future examinations. The 5 colorimetric test areas encompassed on LABSTIX Reagent Strips are:

pH—values are read numerically in the essential range of pH 5 to pH 9.

Protein—results are read either in the "plus" system or in mg. % in amounts approximating "trace," 30, 100, 300, and over 1000 mg. %.

Glucose—provides a "Yes-or-No" answer for urine "sugar spill."

Ketones—detects ketone bodies in urine—**both** acetoacetic acid and acetone. Reacts with as little as 5 to 10 mg. % of acetoacetic acid.

Occult Blood—specific test for intact red cells, hemoglobin or myoglobin. Results are read as negative, small, moderate or large amounts.

Now a Clear Reagent Strip of Firm Construction

...facilitates handling during testing procedure. Excellent color contrast made possible by the clear plastic strip, together with the clearly defined color charts provided, permits precise, reproducible colorimetric readings in all 5 test areas. A more definitive interpretation of uro-analytical facts is made possible.

Available: LABSTIX Reagent Strips, bottles of 100 (color charts are supplied with each bottle).

RADIOLOGY FOR THE MEDICAL STUDENT

A Clinical Experience

JOHN M. DENNIS, MD
Professor and Head, Department of Radiology, University of Maryland School of Medicine

Medical education in the United States has been in a phase of transition since World War II, with many traditional teaching methods being replaced by radical new approaches. The undergraduate teaching of radiology has undergone many metamorphoses during this period. When one considers that today there is scarcely a human disease in which the science of radiology is not employed in its diagnosis or treatment and that the accuracy of radiologic diagnosis is exceeded only by microscopic examination of the disease tissue involved, there can be no argument that radiology should occupy an important position in the education of the medical student. Just what the student should be taught and how it should be taught is a matter of controversy and varies from almost nothing in some medical schools to a sizeable part of the curriculum in others.

Rigler has offered three fundamental objectives for a good undergraduate teaching program in radiology: 1) to produce good doctors by teaching students the maximum utilization of radiology in the care of their patients, 2) to elevate the status of radiology as a specialty, and 3) to obtain the best young physicians for residency and graduate training programs.

Every physician is charged with the responsibility of being a teacher, and the radiologist even more so when one considers the potential of radiology as a teaching discipline. That radiology is an ideal medium for dissemination of the basic science program is widely recognized, but it is in the clinical years that differences of opinion as to how much or how little should be taught become apparent. There are three basic concepts as to the amount of radiology that should be taught a medical student: 1) only that radiology exists and has certain usefulness in the diagnosis and treatment of disease, 2) the indications for the use of radiology, its possibilities, its limitations, and its dangers, and 3) as much radiology as possible, assuming that the more he knows about it the more he will appreciate its possibilities and limitations.

The status of radiology in American medical schools has suffered because many academic radiologists have accepted an excessive service function with neglect of their teaching and research responsibilities. Rapid increase in demands for more sophisticated time-consuming diagnostic radiologic studies have overtaxed the facilities and qualified professional personnel in many academic departments. Contact between the radiologists and students is infrequent, and the teaching functions of the radiologists have been assumed by members of other better staffed

clinical departments, tending to diminish the status of radiology among the medical specialties. In those areas where the radiologist does little teaching, the standing of radiology is low. Academic radiologists have an obligation and duty to develop in the minds of medical students during their formative years that radiology is best practiced by the radiologists.

As the youngest of the major medical specialties, radiology does not hold a high priority for time in the curriculum. Many schools are reluctant to make drastic curriculum changes, as many clinicians believe that radiology can best be taught as an integrated program closely related with other scientific disciplines and thus does not require a large separate block of time. The disparity between time given to anatomy and some other subjects and that given to radiology is deplorable when one considers the greater use made of radiology in clinical practice.

As a visual science, radiology is an excellent discipline in which to accentuate the teaching of anatomy, physiology, and pathology. Consequently, most American medical schools have a good integrated program of radiologic teaching in conjunction with these basic science departments. These same schools, however, offer the student little clinical training in radiology, particularly from radiologists, because of the excessive work load of the department and because other clinicians consider themselves to be excellent radiologists who can best instruct the student in radiology as an integral part of their clinics and conferences. This is not true. While some physicians, such as urologists and gastroenterologists, may be extremely capable radiologists in their own sphere of activity, they are not competent in all of the body systems. Medical students are taught that they must take care of the "whole patient," but in most instances, they are not being taught to do so from a radiologic standpoint. Even when radiologists are available at joint conferences to present and discuss the radiologic manifestations of a specific case or disease, this method of teaching is ineffectual for the undergraduate medical student. The student sees the particular findings demonstrated but is seldom put in the position of having to interpret or make a decision on these radiologic findings.

Because of the shortage of staff personnel, new teaching methods are being studied in some academic departments. Foremost of these is programmed teaching. While its superiority to more classical methods has not been proved, it is an effective method of teaching.

To provide good training in radiology for a medical student in his clinical years and to arouse his interest in it, it should be taught as a clinical subject the same as medicine, surgery, and obstetrics. The student must be given responsibility, when possible, for the radiologic evaluation of patients. To best meet this responsibility, the student should be assigned full time in radiology department for a period of time so that he can see radiology from the standpoint of the radiologist rather than as an observer at clinical conferences. Here, the student can be taught how to analyze the various radiologic studies and how to interpret the findings in making diagnoses. There should be a mandatory and an elective assignment in the department. This, of course, will require more professional personnel, and the medical schools must accept this additional financial responsibility.

For the past 10 years, we have been trying to make radiology a clinical experience for our third and fourth year medical students. On the basis of yearly student evaluation of the teaching in every clinical department, we think we have attained our goal reasonably well. A brief description of our program may be useful.

A series of 24 lecture-demonstrations is presented to the third year students, in small groups, covering the routine studies of the major body systems with a review of the normal anatomy and the commonly encountered lesions in each system. Five lectures on the basic principles of radiation therapy are also presented.

The fourth year students obtain clinical orientation in radiology. They have a scheduled assignment in the department, in groups of five or six, for a two-week period. During this time, on a rotational basis, the students 1) accompany the senior and resident staffs on fluoroscopy, 2) "walk the floor," interviewing and taking a history from all outpatients and then reviewing the radiographs with a staff radiologist, 3) observing, assisting with, and even performing special procedures, and 4) spending time in the

reading rooms with the staff radiologists going over the current cases, discussing the radiographic findings, and trying to correlate them with the clinical and expected gross pathologic findings. Daily noon time conferences are held with the students to review routine cases such as gastric ulcers, lung diseases, and heart disease. The students are also expected to review a student teaching file of select cases of the common disease entities in correlation with recommended reading assignments.

A one-month elective course in radiology offers fourth year students a more expanded program in clinical radiology. Since most of the students choosing an elective in radiology have already had the compulsory assignment, they are treated almost as first year residents. Under staff supervision, they are allowed to fluoroscope a few chests, interpret emergency room cases, and assist with and perform special procedures such as arteriography and lymphangiography. This elective has been popular with our students and has allowed us to screen the likely candidates for residency training. Several of our current residents became interested in radiology during their assigned or elective period in the department.

Undergraduate teaching in radiology should be a clinical experience for the student. Radiologists must wholeheartedly accept their responsibilities as teachers and impress on students that radiology is best practiced by radiologists. It should not be the aim that the end-product of a good educational experience in radiology be a neophyte radiologist, but a physician with a good understanding and appreciation of the role of radiology in clinical medicine.

Blueprint for dealing with tension due to stress — Prolixin — once-a-day

For the patient who must be on the job mentally as well as physically, prescribe Prolixin. The prolonged tranquilizing action of as little as one or two mg. helps him cope with tension all day long. Markedly low in toxicity and virtually free from usual sedative effects, Prolixin is effective in controlling both anxiety associated with somatic disorders and anxiety due to environmental or emotional stress. Patient acceptance is good — because Prolixin is low in cost, low in dosage and low in sedative activity. Prescribe Prolixin.

Side Effects, Precautions, Contraindications: As used for anxiety and tension, side effects are unlikely. Reversible extrapyramidal reactions may develop occasionally. In higher doses for psychotic disorders, patients may experience excessive drowsiness, visual blurring, dizziness, insomnia (rare), allergic skin reactions, nausea, anorexia, salivation, edema, perspiration, dry mouth, polyuria, hypotension. Jaundice has been exceedingly rare. Photosensitivity has not been reported. Blood dyscrasias occur with phenothiazines; routine blood counts are recommended. If symptoms of upper respiratory infection occur, discontinue the drug and institute appropriate treatment. Do not use epinephrine for hypotension which may appear in patients on large doses undergoing surgery. Effects of atropine may be potentiated. Do not use with high doses of hypnotics or in patients with subcortical brain damage. Use cautiously in convulsive disorders. **Available:** 1 mg. tablets. Bottles of 50 and 500. For full information, see Product Brief.

Alcohol and the Cardiovascular System
A Survey of Some Recent Observations

EDWARD B. TRUITT, JR., PhD
Department of Pharmacology,
University of Maryland School of Medicine

The physician is often besieged by patients' ideas that alcohol has some beneficial effect on heart conditions. The most persistent idea is that alcohol may be a useful coronary dilator. Probably this belief arises from the fact that the analgesic effect of alcohol obtunds the pain of angina pectoris to a limited extent. The anti-anxiety effect of alcohol is a possible synergistic factor. Analogous reasoning may suggest that since alcohol dilates blood vessels in the skin it might be expected to do so in the heart.

These poorly founded concepts about the action of alcohol on the heart are difficult to lay to rest by even the best of repeated scientific experiments. All types of direct evidence have shown only a depressing action of alcohol on the contraction of heart muscle. In the Master 2-step exercise test, when the characteristic changes in the RS-T segments and T-waves of the electrocardiogram are used as an index of the oxygen supply to the heart, alcohol does not show the same beneficial action as nitroglycerin even though alcohol relieves the pain in anginal patients.[1] Direct measurements in situ on the exposed heart of coronary blood flow in dogs have also failed to show suitable increases in blood supply.[2]

Although it can be shown in isolated hearts that very high concentrations of alcohol (250-400 mg/100 ml) cause a slight increase in coronary blood flow, these results cannot be extrapolated to the intact heart, since the systemic pressure and hence the coronary perfusion pressure drop while the work of the heart is increased.[3] In another study it was found that this increased work by the heart occurs with even smaller amounts of alcohol than those required to lower the general blood pressure and that some of the dogs actually died from cardiac rather than respiratory failure.[4] The increase in heart rate during exercise is much greater after taking ethyl alcohol than during the same amount of work in a sober condition.[5]

The final picture of the effects of alcohol on the heart is seen on autopsy of heavy drinkers. There is an enlargement of the heart, an accumulation of fat, and other characteristic changes which are labeled by the pathologist as alcoholic cardiomyopathy.[6] These distinctive alterations are unrelated to nutritional status. Wendt,[7] in a preliminary report, ruled out the idea of vitamin or food deficiencies as the cause by placing alcoholics on an adequate diet with a high level of vitamin supplements. He believes that heart changes can be detected earlier than the appearance of such obvious symptoms as x-ray or ECG changes by measuring changes in two enzymes, aldolase and lactic dehydrogenase. These and other enzymes are not normally released by the heart at rest or during light exercise, and their appear-

ance in the serum of alcoholics suggests a metabolic derangement of the heart cells.

Ferrans et al[6] observed damage in the heart cells to the mitochondrial particles which contain these enzymes and are responsible for most of the energy supply of the cell. This mitochondrial damage may be the fundamental lesion in alcoholism. Previous work in this department has shown that acetaldehyde produced in the oxidation of alcohol has a potent inhibitory effect on mitochondrial energy mechanisms while ethanol is ineffective directly even in fatal concentrations.[8] A more recent study, still under way, indicates that many alcoholics develop higher blood levels of acetaldehyde than more moderate drinkers.[9]

All of these studies point to the inevitable conclusion that alcohol is just not good for the heart in any measurable way. It seems possible that in certain persons in whom emotional causes of high blood pressure are relieved by small doses of alcohol that a limited amount might be beneficial. Certain other circulatory disorders, such as Buerger's disease and other arterial spasms, might be helped, but better drugs are available for all of these conditions. A dose of brandy has a time-honored place as a reflex stimulant to the circulation, but in general it is difficult to establish a worthwhile case for rational use of alcohol on the circulation.

Childhood Asthma and Mental Retardation

IDRIS M. GRIFFITH, MD

The incidence of childhood asthma was investigated in a series of 400 consecutive outpatients seen at the Children's Psychiatric Research Institute, London, Ont., between January 1961 and January 1962. Of this number 380 were mentally retarded and 20 were of normal intelligence. Health histories for each child were obtained in the following ways: (1) A questionnaire was filled in at home by the parents before coming to the clinic. (2) A full health history of the child was obtained by the attending physician during the first day-long session and this was supplemented by a session with the social worker. (3) Further information about the child and the family was obtained by the doctor and social worker during the four or five sessions that took place in the ensuing six months. The incidence of asthma among the parents was also ascertained; the finding was later double-checked over the telephone by the author and by a voluntary worker in contact with the parents and the doctor concerned.

RESULTS AND COMMENT

Of our 400 children, two were reported to have chronic asthma. One of these had an intelligence quotient of 108 and the other of 78. This places them both above the mental retardation level. Of the 380 mentally retarded children not one gave a history of asthma.

In school children in Birmingham, England, Smith[1] found an overall prevalence of asthma of 1.76 per 100 persons. On this basis we expected six or seven cases among our 400 patients. The approximately 800 parents, however, contained 11 with asthma, which is near the average for the general population.

DISCUSSION

Our cases of mental retardation have such varied etiologies that it is not possible to generalize to the effect that there is a negative relationship between mental retardation and childhood asthma. Guthrie,[2] for example, has reported a phenylketonuric child with asthma.

It is generally recognized that psychodynamic factors often play a role in the onset of childhood asthma. It may be that the brain-damaged or mentally retarded child is unable to partake in certain types or degrees of emotional interaction between parent and child seen in the normal child. In a strictly physical approach one may entertain hypotheses concerning possible cortical cell deficiencies or biochemical abnormalities.

The Science of Communication as practiced at Monumental Printing

It's more than a science: it's an Art, the precise transliteration in print of an intangible idea for a heterogeneous group of critical readers.

Here, at Monumental Printing, we learned to handle the tools of intelligent communication by the empirical method: working with them. The brush and palette of our art, the chisel, the score, the script are simply words on paper. We learned their proper use over 50 years of practice by being permitted to print such Journals as:

Clinical Chemistry
Digestive Diseases
Fertility & Sterility
Occupational Medicine
Leprosy
Mental Hospitals
Psychiatric Studies and Projects
Psychosomatic Medicine

We speak *your* language. We know the difference between edema and enema; syndrome and symptom; sewage and sewerage. And when and why we should use 12 point Caslon Bold instead of 10 point Stymie.

If you, too, need a good printer, let's communicate!

MARYLAND POISON INFORMATION CENTER

The Maryland Poison Information Center has been established as a 24-hour, seven-day a week service for Maryland physicians. It is sponsored by the Maryland State Health Department with the financial aid of a beneficient organization.

The growing variety of medications and toxic commercial products and the rapid developments in clinical toxicology has created the need for a central agency with a comprehensive up-to-date library and a staff trained to quickly locate product composition and toxicologic data. It is to supplement the present eight Poison Control Centers:

1) Baltimore City Hospitals
2) Johns Hopkins Hospital
3) Peninsula General Hospital
4) Sacred Heart Hospital
5) Sinai Medical Institutions
6) Suburban Hospital
7) University of Maryland Hospital
8) Washington County Hospital

These were initially sponsored jointly in 1956 by the Maryland Chapter of American Academy of Pediatrics and the State Department of Health and will continue to function especially as treatment centers.

Incoming calls are taken by the medical secretary or one of the pharmacists who have been intensively trained in the past six months to handle requests for technical information. Should the inquiring physician wish medical consultation, physicians experienced in current clinical toxicology are always on call.

The aims of the Center are to give more individualized and improved patient care and to stimulate future toxicologic research through up-to-date and easily accessible information for physicians. It is also hoped through data collection to increase recognition of etiologic situations and stimulate more prevention programs for the public.

In suspected cases of poisoning call DI 2-0800 for the following information:

1) **Toxicology and pharmacology of drugs, chemical substances and household products**
2) **General formularies**
3) **Tests for identification of toxic substances**
4) **Medical consultation for poisoning cases**
5) **Abstracts of clinical toxicology articles**
6) **Available treatment and laboratory facilities**

By providing combined anorexigenic-tranquilizing action, BAMADEX SEQUELS Capsules help your nonshrinking patients to establish new patterns of eating less. The amphetamine component suppresses the appetite, while the meprobamate helps allay nervousness and tension. And for most patients, the *sustained* release of the active ingredients provides convenient one-capsule-a-day dosage.

Side Effects commonly associated with either component are possible but, to the extent these are dose-related, they should normally be mild and infrequent, since the total dosage of each component on the usual one-capsule-daily regimen is quite low. Also, the sedating effect of meprobamate and the stimulating effect of d-amphetamine sulfate tend, to some extent, to cancel each other out. Adverse effects not peculiar to either component have not been reported. Side effects associated with d-amphetamine sulfate include: insomnia, excitability, increased motor activity, confusion, anxiety, aggressiveness, increased libido, hallucinations, rebound fatigue, depression, dry mouth, anorexia, nausea, vomiting, diarrhea and increased cardiovascular reactivity. Effects associated with meprobamate include: skin rash, nonthrombocytopenic purpura with petechiae, ecchymoses, peripheral edema, fever and transient leukopenia; also, very rarely, fainting spells, angioneurotic edema, bronchial spasm, hypotensive crisis, anuria, stomatitis, proctitis and anaphylaxis. Other serious effects have occurred after concomitant administration of meprobamate and other drugs. Massive overdosage may produce grave effects.

Precautions: BAMADEX SEQUELS should be given only under close supervision to patients hypersensitive to sympathomimetic drugs, with cardiovascular or coronary disease or who are severely hypertensive; to emotionally unstable persons and to epileptics. Patients should be cautioned not to drink alcoholic beverages while on the drug, and not to drive vehicles if they become drowsy. In all patients kept on the drug for long periods, the drug should be withdrawn gradually to avoid possible serious reactions.

Contraindications: Hyperexcitability, agitated prepsychotic states and a history of previous reactions to meprobamate.

Learn To Do Your Part In The Prevention Of Disease

Highlights of Sanitary Services for 1965

ENVIRONMENTAL HYGIENE

The Division of Community Sanitation serviced 2,750 complaints concerned with various insanitary conditions and nuisances. Inspections of foster homes, day nurseries, hospitals, the city water supply, and swimming pools were continued. Over the last six years, the number of pools to be regularly inspected has more than doubled to a total of 73.

The Division of Rodent Control serviced 3,015 complaints of rodent infestation, investigated 69 rat bite cases, and took corrective action where necessary. Cooperation continued with the Urban Renewal and Housing Agency and neighborhood councils in developing rodent control programs in specific areas. In addition, programs of rodent and insect control training were given by the division to the Fort Howard Veterans Hospital personnel, to Health Department personnel of both Baltimore and Frederick counties, and to personnel of the city's Bureau of Building Inspection.

FOOD CONTROL

In 1965, the Bureau of Food Control made 13,000 inspections of the 33 types of food establishments in the city and investigated 800 complaints. A total of 180,000 pounds of food was condemned.

Alleged food poisoning outbreaks decreased from 29 in 1964 to 24 in 1965, and only four were proved to be foodborne. The food industry continued to supplement the work of the bureau inspectors with its self-inspection program.

Three potentially dangerous imported novelties were removed from sale in stores. These were stuffed baby ducks containing both a pesticide and salmonella organisms, highly explosive candy-like "cracker balls," and "ice kools," plastic drink coolers that were found to contain polluted water.

INDUSTRIAL HYGIENE

The Baltimore Metropolitan Air Quality Survey was begun as an official project of the Baltimore City Health Department, the Maryland State Department of Health, and the Baltimore and Anne Arundel County health departments. This air survey group selected and ordered the equipment for monitoring pollutants at six stations of the Metropolitan Air Quality Network.

In striving to improve air quality in the city, a cooperative agreement was reached with the Baltimore City Fire Department on the issuance of permits for open burning.

The bureau continued its measurement of fallout radiation in the air and the city's water supply. In addition, 13 veterinary x-ray units were surveyed. Four were found to conform to state requirements, and nine were required to take corrective action.

No child deaths from lead paint poisoning occurred in the city in 1965. This is the first year in which there was no death from this illness since 1931, when records of lead poisoning were begun. Child lead paint poisoning cases dropped to 32, the lowest in 10 years.

MEAT INSPECTION

The Bureau of Meat Inspection personnel supervised the processing of 27,000,000 pounds of meat and meat products in both city and county

processing plants and condemned 797 pounds. Of the 203,000 livestock slaughtered, only 251 whole animals and 25,000 animal parts were condemned as unfit for human consumption. On one occasion 100,000 pounds of meat suspected of spoilage was held for reexamination; however, all but 10,000 pounds was approved on reinspection.

The bureau also conducted rabies examinations in connection with 975 dog bite cases in 1965. These were made in cooperation with the City Health Department's Bureau of Communicable Diseases and the Municipal Animal Shelter.

MILK CONTROL

The problem of pesticides in milk was brought under control in 1965. During the year only two farms were suspended for unacceptable pesticide levels in their milk, and they were reinstated when the condition was corrected. In 1965, for the first time, all farms had converted from storing and transporting milk in cans to storing in refrigerated bulk tanks and transporting in tank trucks to the milk plants.

The milk industry continued its self-inspection system with monthly milk samples tested at certified industrial laboratories and the results reported to the City Health Department.

For the 10th consecutive year no instance of improper pasteurization of milk was reported.

Cooperation continued with the U. S. Public Health Service and the Maryland State Department of Health in testing for radioactive fallout materials in milk. No unsafe levels were discovered.

Robert E. Farber, MD
Commissioner of Health

DEPARTMENT OF HEALTH
STATE OF MARYLAND
William J. Peeples, MD, MPH, Commissioner

Highlights

TITLE XVIII CONTRACT SIGNED

In a contract signed between the State of Maryland and the Social Security Administration, Governor Tawes designated the Health Department as the state agency to work with the Social Security Administration on Title XVIII of Public Law 89-97. This section of the Act, which concerns the hospital insurance program for all persons over 65, requires certification of providers of supplemental medical benefits, such as hospitals, extended care facilities, home health agencies, and independent laboratories. As the agency responsible for certification, the Department will verify eligibility of such providers to participate in the new Social Security program and will give assistance and consultation to help any who may not qualify.

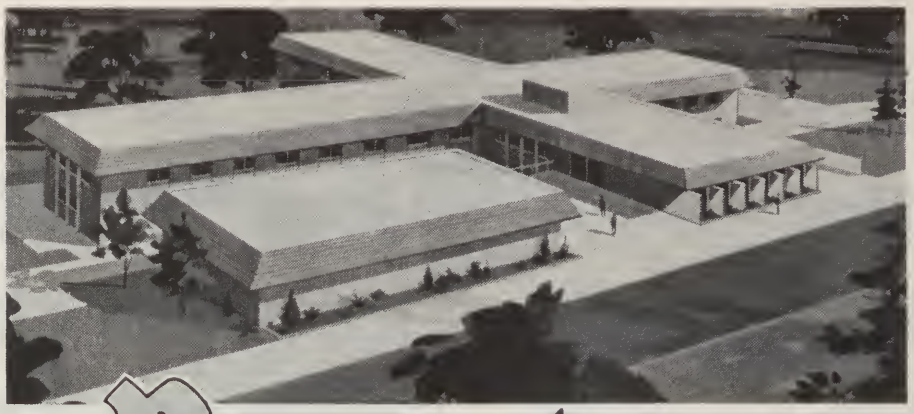
PROCESSING MEDICAL BILLS

An increasing backlog of Medical Care bills made it necessary last fall to initiate a regular four-hour night shift on the accounting machines. This has increased the average number of bills processed by almost 40%. The number of bills exceeds 100,000 each month. This interim step to keep bills up to date will be continued until the new computer is installed.

MALARIA CASE CONFIRMED

The alertness of a private laboratory technician in identifying the parasite **Plasmodium malariae** brought about the quick diagnosis of the relatively rare Quartan type of malaria. The patient, an adult man, had returned to Maryland in November, 1965, after eight months in Liberia. The diagnosis was confirmed by the State Health Department laboratories, which then referred the blood specimen to the Communicable Disease Center in Atlanta.

RABIES IMMUNIZATION PROGRAM



After the Health Department recommended vaccination of high-risk groups against rabies, services were requested by the State Department of Game and Inland Fish and the Maryland State Veterinary Medical Association.

The program developed by the public health veterinarian is twofold: 1) It offers protection, without the risk of horse serum, to people who are frequenly exposed to biting animals which may be rabid. 2) When these people have become immunized, they may donate blood which can be used to make a safer product for treating others who have been bitten by animals.

NEW PUBLIC HEALTH NURSING CHIEF

Mrs. Ruth B. Marggraff, RN, MPH, has been appointed chief, Division of Public Health Nursing, succeeding Miss Helen L. Fisk, who retired in December after 23 years of service with the Health Department.

Mrs. Marggraff formerly was director of public health nursing for the Anne Arundel County Health Department. The division which she now heads assists local health departments in developing nursing services, maintaining standards, recruiting and train-

Kurt Gorwitz, Statistics Director

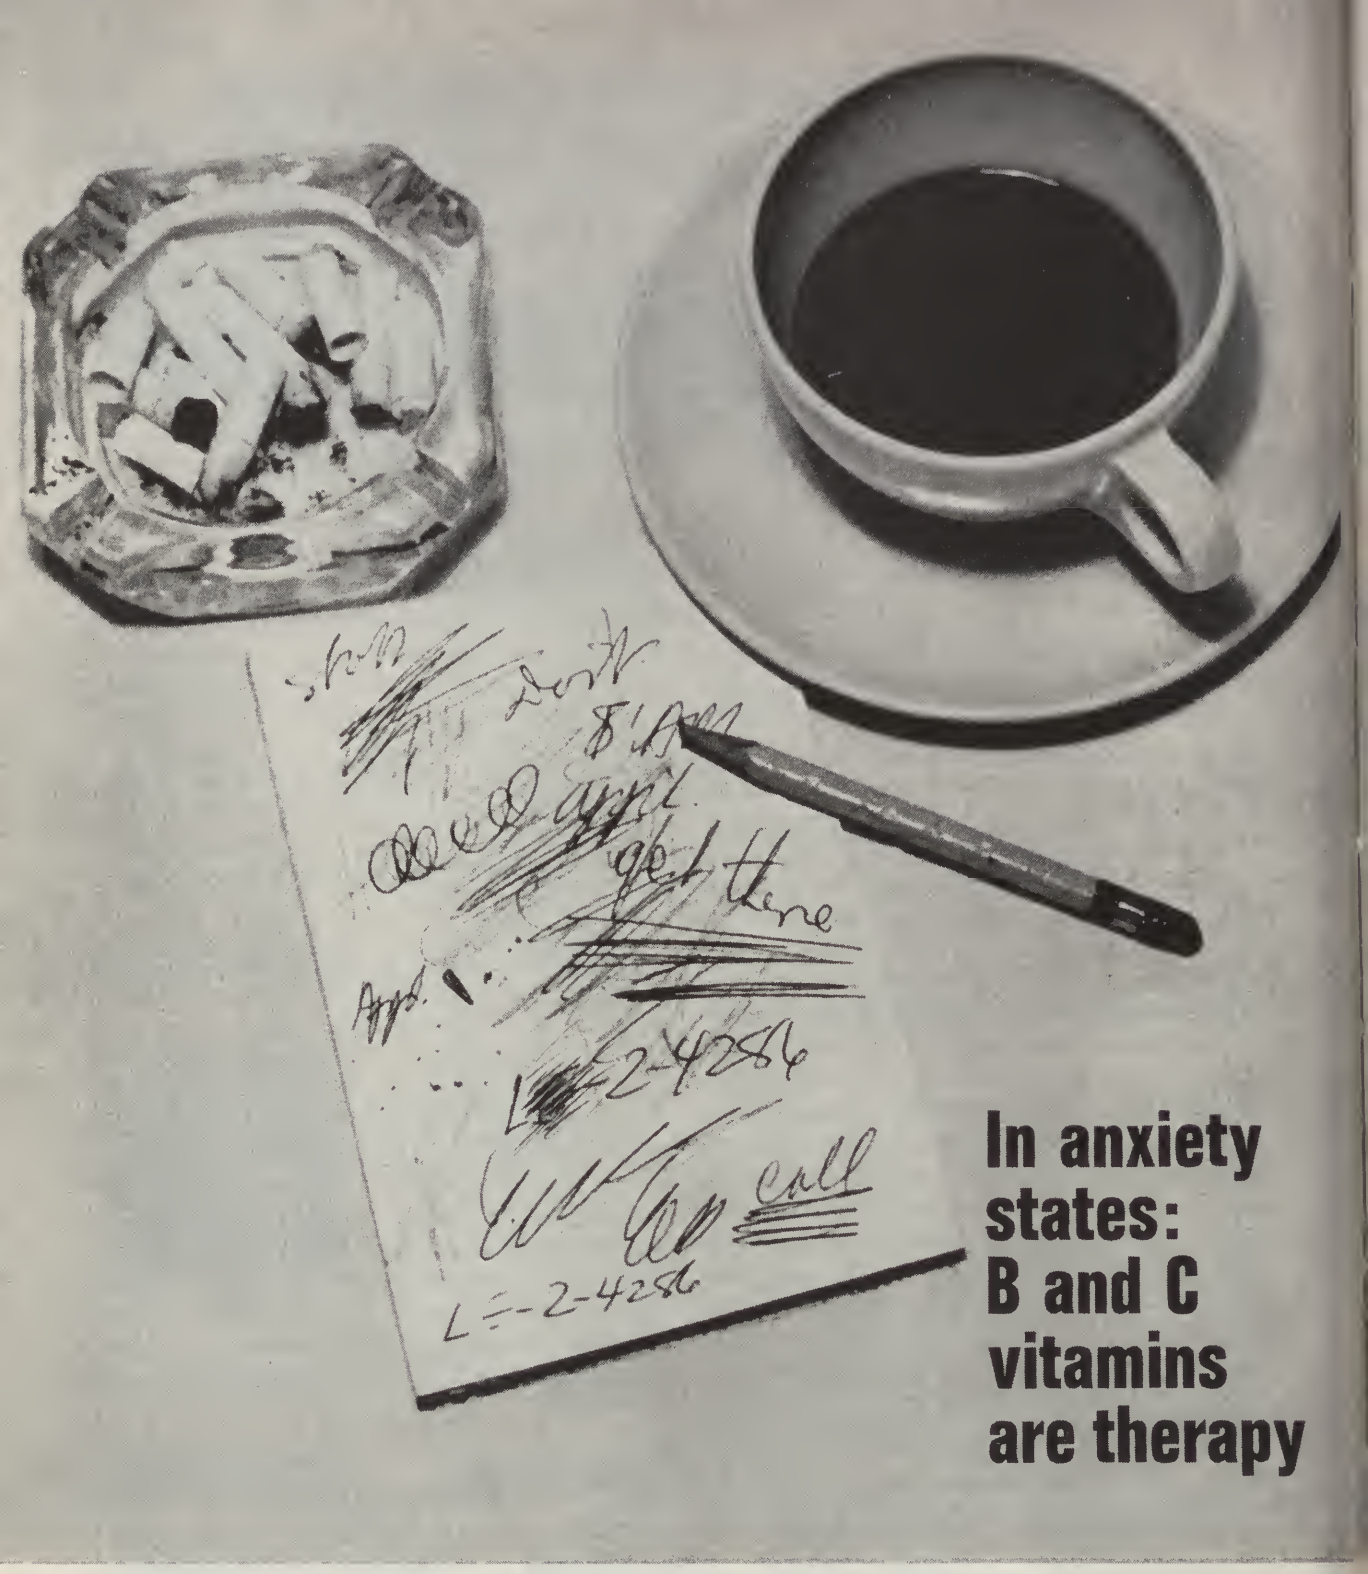
A Midyear Report

A total of 16,287 patients was treated in Maryland's psychiatric hospitals during the first six months of the 1966 fiscal year. The increase of 2,051, or 14.4%, during the past four years represents a continuation of a long range upward trend. Proportionally, it exceeds the increase in Maryland's total population during this period.

This steady growth has been due mainly to the rapid patient turnover resulting from the growing number of admissions for short term intensive treatment for acute disturbances. As indicated in the table, both admissions and discharges increased substantially between 1962 and 1966. At the same time, the average size of the hospital population has remained virtually unchanged.

Most newly admitted patients are released within three months, and nine out of 10 leave within one year. Only 5% remain hospitalized after two years. This has meant that there is now only a moderate buildup in the number of patients hospitalized continuously for extended periods. As former long term patients die or are released, they are replaced by a smaller number of new chronic cases. The net effect of this has been that:

1. The proportion of beds occupied by long term patients with chronic illnesses is decreasing while the proportion occupied by short term patients with acute disturbances is rising.



2. The average period of hospitalization of newly admitted patients is going down and is now much smaller than a few years ago. At the same time, the proportion of released patients who are rehospitalized does not appear to have changed.

3. The average size of the hospital population has remained unchanged at the same time that the total number of patients treated is increasing. However, due to the rise in the number of admissions, it too is now beginning to go up.

The implications are important: One, the development of community centered programs has not yet reached the admissions to state hospitals. Further, expansion and coordination of alternatives to hospitalization in a state operated facility is therefore essential. It should be clear also that patient-staff ratios applicable to a custodial hospital population are not applicable to a patient population experiencing a rapid turnover. Continuing reevaluation and reassessment of needs is indicated if adequate service levels are to be maintained.

Kurt Gorwitz

First Six Months of Fiscal Year	Average Size of Hospital Population	Total Patients Treated	Admissions	Discharges
1962	8,297	14,236	2,877	2,443
1966	8,093	16,287	4,420	3,784
Net change	—204	+ 2,051	+1,543	+1,341
Per cent change	— 2.5	+14.4	+53.6	+54.9

In anxiety states: B and C vitamins are therapy

Stress formula vitamins are an important supportive measure in maintaining the nutritional status of the emotionally disturbed patient. With STRESSCAPS, B and C vitamins are present in therapeutic amounts to meet increased metabolic demands. Patients with anxiety, and many others undergoing physiologic stress, may benefit from vitamin therapy with STRESSCAPS.

Each capsule contains:

Vitamin B_1 (as Thiamine Mononitrate)	10 mg.
Vitamin B_2 (Riboflavin)	10 mg.
Niacinamide	100 mg.
Vitamin C (Ascorbic Acid)	300 mg.
Vitamin B_6 (Pyridoxine HCl)	2 mg.
Vitamin B_{12} Crystalline	4 mcgm.
Calcium Pantothenate	20 mg.

Recommended intake: Adults, 1 capsule daily, for the treatment of vitamin deficiencies. Supplied in decorative "reminder" jars of 30 and 100; bottles of 500.

Professional Business Management

Office Tidiness—A Continuous Chore

This article originally appeared in Physician's Management, *October, 1962. It was presented as a fall office cleaning idea. We now present it as a suggestion for spring office cleaning.*

WILBURN L. McCLURE, Jr.

When's the last time you thoroughly cleaned the office and cleared out the excess baggage? While everyone knows that keeping the office neat is a daily problem, a more thorough effort should be made at least once a year. You should set aside a time each year to be sure this is done in as orderly and least harassing method as possible.

Have you innocently opened the closet next to the examining room recently and a box of miscellania cascaded down from the top shelf? If so, you have probably reached a critical state in your twentieth-century American life; the stage when you simply own too much.

The squeeze doesn't usually start until after several years of practice. Then it moves inexorably toward a climax. Here are some simple tests.

Can you walk across your reception room without noticing an excess of magazines, crooked pictures, or dusty window sills?

Have you permitted extra umbrellas, coats, and hangers to accumulate in the waiting room closet or the one you and your aides use?

Does your drug room or storage closet look like an oversized, disorganized, overstocked household medicine cabinet?

Is there a heap of medical journals, miscellaneous junk mail, and the like in the office?

There are more questions, but if your answers are unfavorable so far, it is time to employ a few remedies to solve this problem.

There is only one real cure: clear out the unneeded items and clean up your office. Sift through that accumulation of clutter for what you really need. The best way is to pretend you are going to move and have to pack everything in cartons for the truckers. Place one big carton in the center of each room, top open. By the time you have dragged out the nearly empty tissue boxes, irreparably broken instruments, outdated drug samples, old magazines, and so on, you should have developed sufficient despair to do a good job of chucking things into the cartons.

Once the cartons are filled, have the janitor pick them up immediately and haul away. Do not, by any means, give in to the temptation to hold them in the office "just overnight." If you allow them to remain, odds are that half the stuff will be right back where it came from in the morning.

George Bernard Shaw said, "The more a man possesses, the more careworn he becomes." How true!

Woman's Auxiliary

MARYLAND
HYGEIA FILIAE
W A M C F

MARCH, 1966

MRS. IRVING J. TAYLOR, *Auxiliary Editor*

FASHION FIREWORKS GO OFF WITH A Bang

The eleventh annual luncheon and fashion show of the Woman's Auxiliary to the Montgomery County Medical Society, held at the Regency Ballroom of the Shoreham Hotel on November 2, earned more than $1,800 for the auxiliary's scholarship funds for medical and nursing students.

Carrying out the theme of "Fashion Fireworks," red fire crackers adorned the tables, and a large red rocket dominated the center of an x-shaped runway. Fashions illustrated "Rockets Red Glare," "Sports Explosion," "Shoot the Moon," and "Flares in the Night."

Left to right: **Jackson Weaver, of Radio Station WMAL; Mrs. James A. Roberts, president of the Woman's Auxiliary to the Montgomery County Medical Society; Mrs. Richard E. Lukes, luncheon chairman and president-elect; and Frank Harden, of Radio Station WMAL.**

In the grand finale, the models carried sparklers.

The fashion show was staged by couturier fashions from the Embassy Room of the Hecht Company and featured American and European designs. An ensemble by Sidney furnished music, and Frank Harden and Jackson Weaver of Radio Station WMAL were masters of ceremonies.

Awards were presented to Dr. William B. Walsh, founder and president of Project HOPE, and Dr. Nicholas P. Dallis, creator of the comic strip, "Rex Morgan, MD." Philip Steitz, associate director of the Volunteers in Service to America, former managing editor of the newspaper syndicate for the "Rex Morgan, MD" comic strip, accepted the award for Dr. Dallis. The certificate cited Dr. Dallis' "laudable and noteworthy contribution over the years to the field of medicine, to its improved understanding by the laiety and toward enhancement of the public image of the physician."

Dr. Walsh was recognized for his "noteworthy contribution to humanity through the promotion of international medicine, cooperation, understanding, good will and improved health standards."

Honored guests included John P. Haberlin, MD, president of the Montgomery County Medical Society; Mrs. Martin E. Strobel, president of the Woman's Auxiliary to the Medical and Chirurgical Faculty of the State of Maryland; Mrs. Hugh O. Fulcher, president of the Woman's Auxiliary of the District of Columbia; Mrs. William H. Stewart, wife of the Surgeon General of the United States; Mrs. Luther L. Terry, wife of the former Surgeon General of the United States; the Reverend John O. Humbert, pastor, North Chevy Chase Christian Church, and Mrs. William B. Walsh.

BONE TUMORS, 3rd ed, by Louis Lichtenstein, MD. Mosby, 1965. $16.75

As with the preceding editions, this is offered primarily to supply the practical answers needed by the pathologist, the surgeon, or the radiotherapist interested in bone tumors. Many observations made since 1958 have been incorporated in this text, and the entire edition has been considerably revised.

VISUAL CAPABILITIES IN THE SPACE ENVIRONMENT, edited by Charles A. Baker. Pergamon Press, 1965. $10.50

This is a compilation of up-to-date information on the capabilities and limitations of man's visual sense in the exploration of space. Sixteen articles, by twenty contributors, cover vigilance and the visual environment in space and the effects of vibration on vision. Specific mission problems are dealt with, such as visual aspects in lunar landing, and visual reconnaissance from space. One article summarizes the visual experiences of previous astronauts and cosmonauts, and another suggests visual experiments for future space flights. The new concepts on human vigilance presented here by Dr. Jerison and Dr. Pickett have heretofore not been published.

PROGRESS IN THE CHEMISTRY OF FATS AND OTHER LIPIDS, volume VIII, part 1, edited by R. T. Holman. Pergamon Press, 1965. $15

This volume is the latest in a series designed to fill a serious gap in the literature of a field in which there is rapid expansion. Part One contains a comprehensive article by Van Deenen entitled "Phospholipids and Biomembranes."

PHARMACOLOGY OF THE CORONARY CIRCULATION, by N. V. Kaverina. Pergamon Press, 1965. $12.50

This book deals with an important problem in contemporary medicine—pharmacologic action on the coronary circulation. The present state of the problem is reviewed, and the author's research is described. He considers methods and approaches to the study of coronary circulation, its physiology and mechanisms of pharmacologic effects. Drugs influencing the nervous control of coronary vessels are discussed at some length. New evidence is offered on the mechanism of action of some pharmacologic agents; the diphasic action of epinephrine on coronary vessels is described.

ATLAS OF CATARACT SURGERY, by John M. McLean, MD. Mosby, 1965. $20

This book is intended as a practical instructive manual for the operating surgeon. An outgrowth of more than 25 years of teaching and lecturing, it illustrates in detail those methods which have proved most practical.

THE ECONOMICS OF VOCATIONAL REHABILITATION, by Ronald W. Conley. The Johns Hopkins Press, 1965. $6

This study deals with economic problems caused by physical and mental disability and the economic feasibility of rehabilitating mentally and physically handicapped persons. The author, an economist at the National Institute of Mental Health, maintains that the costs of rehabilitation are less than the increased financial value of the rehabilitated person to the economy. He supports his belief that rehabilitation programs not only benefit the disabled person but also are a sound investment for businessmen and taxpayers.

PEDIATRIC ELECTROCARDIOGRAPHY, by Warren G. Guntheroth, MD. Saunders, 1965. $7

This monograph introduces a pediatric approach to electrocardiography. The discussion was kept simple and short to induce the reader to progress from the beginning to the end of the book, since the parts are interdependent. Illustrations are those of the author.

DOCTORS AND THE STATE, by Jeanne L. Brand, PhD. The Johns Hopkins Press, 1965. $7.95

This study traces the role of the British medical profession in the development of government action for preventive and curative medicine during the transition years, 1870-1912, which led England toward a program of socialized medicine. Based on broad research in many hitherto unpublished official sources, the book opens with the work of the Royal Sanitary Commission and the establishment, in 1871, of a new central authority for public health and concludes with the battle between Lloyd George and the British Medical Association during the passage of the National Health Insurance Act of 1911.

The author also describes the significant part played by medical men individually and by medical journals in the passage of comprehensive sanitary legislation, as well as many other aspects of the changing patterns of state medicine in Britain.

MANAGEMENT OF THE PATIENT WITH CANCER, edited by Thomas F. Nealon, Jr., MD. Saunders, 1965. $27.50

Seventy-one authorities covering every aspect of the treatment of cancer have contributed to this massive volume. It is a comprehensive work designed for general practitioners and specialists in medicine and surgery who treat patients with neoplasms. It brings to them the essential information about cancer of all sites in a succinct manner so that they can appreciate the best approach to the management of each patient.

The contributors have attempted to be particularly specific about manifestations of the disease, methods of diagnosis and criteria for proof of diagnosis, selection of form of treatment depending upon the extent of the disease, results that may be expected from treatment, likely manifestations of recurrence, and the latest methods of palliation for recurrent cancer.

Each contributor was asked to describe a rational plan of management of a particular problem and to omit exhaustive cataloging of alternative methods. When a well known or popular procedure is not recommended, the author explains his reason for not supporting it.

The weight of clinical evidence favors Librium

With Librium (chlordiazepoxide HCl), the weight of a five-year record of efficacy and safety in clinical use is supported by over 630 reports in the medical literature. Its virtually specific antianxiety action normally reduces disturbing emotional complaints promptly without compromising the patient's mental alertness or ability to perform normal functions. Decisive results are often seen in patients who had not improved on previously used psychotropic drugs.

In prescribing: Dosage—Adults: Mild to moderate anxiety and tension, 5 or 10 mg t.i.d. or q.i.d.; severe states, 20 or 25 mg t.i.d. or q.i.d. Geriatric patients: 5 mg b.i.d. to q.i.d.

Side Effects: Side effects, usually dose-related, include drowsiness, ataxia, minor skin rashes, edema, menstrual irregularities, nausea and constipation. When treatment is protracted, blood counts and liver function tests are advisable. Paradoxical reactions may occasionally occur in psychiatric patients. Individual maintenance dosages should be determined.

Precautions: Advise patients against possibly hazardous procedures until maintenance dosage is established. Though compatible with most drugs, use care in combining with other psychotropics, particularly MAO inhibitors or phenothiazines; warn patients of possible combined effects with alcohol. Observe usual precautions in impaired renal or hepatic function, in long-term treatment and in presence of depression or suicidal tendencies. Exercise caution in administering drug to addiction-prone patients or those who might increase dosage; withdrawal symptoms, similar to those seen with barbiturates or meprobamate, can occur upon abrupt cessation after prolonged overdosage. Caution should be exercised in prescribing any therapeutic agent for pregnant patients.

Supplied: Capsules, 5 mg, 10 mg and 25 mg, bottles of 50.

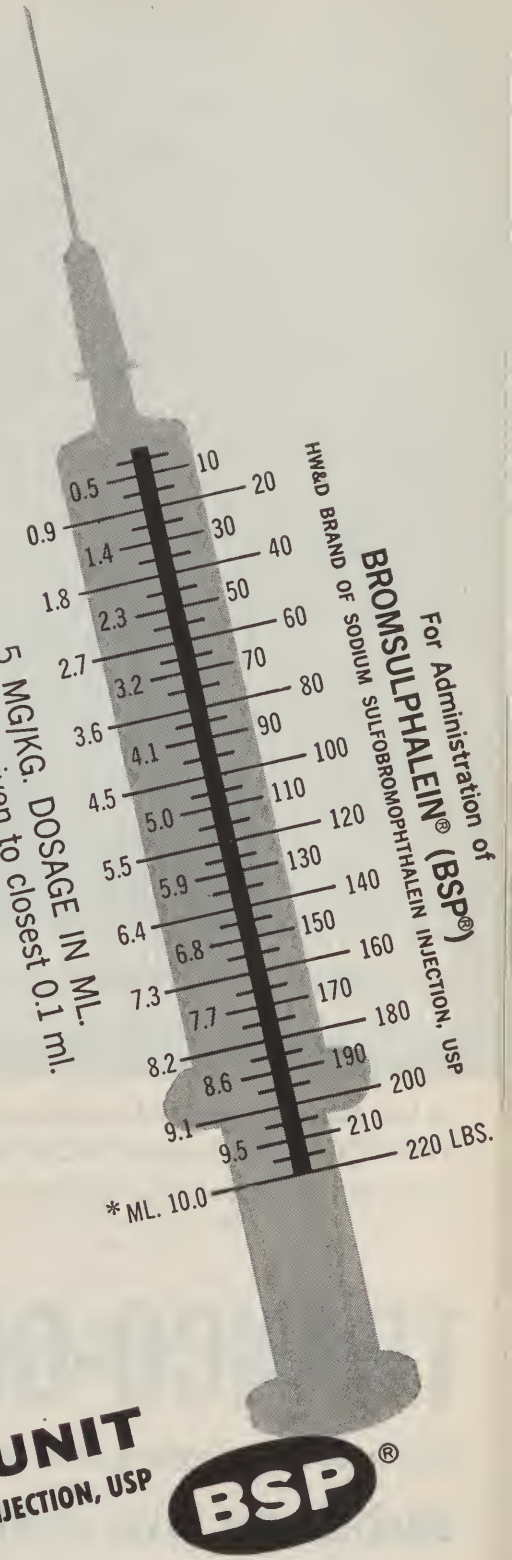
BSP® DISPOSABLE UNIT

A RELIABLE, PROVEN PRODUCT . . .

The BSP test, introduced in 1925, remains one of the most sensitive laboratory procedures available for determining hepatic function.



A STERILE, CONVENIENT PUT-UP . . .

Each BSP Disposable Unit contains: a sterile, glass, disposable syringe with the 5 mg./kg. BSP dosage schedule imprinted on the barrel, a sterile needle, alcohol swab and a 7.5 ml. or 10 ml. size ampule of Bromsulphalein.

The BSP unit is designed for maximum patient protection. The precalibrated syringe makes weight calculations unnecessary and provides for proper dosage regardless of patient-weight.

ECONOMICALLY PACKAGED . . .

Prepared for economic unit dispensing, this completely disposable put-up affords a savings in time and labor—the most costly commodities.

Patients won't complain about bitter penicillin taste when you specify V-Cillin K. Here's why: It has a special coating, only one and a half *thousandths* of an inch thick. Because it is designed to dissolve after approximately six seconds, this barrier to bitterness remains on the tablet as it slides past the tongue. When the tablet reaches the stomach, however, the coating has dissolved, and the penicillin is ready for immediate absorption into the bloodstream.
Result? The proved efficacy of potassium penicillin V without the penalty of bitter taste.

Indications: V-Cillin K is an antibiotic useful in the treatment of streptococcus, pneumococcus, and gonococcus infections and infections caused by sensitive strains of staphylococci.

Contraindications and Precautions: Although sensitivity reactions are much less common after oral than after parenteral administration, V-Cillin K should not be administered to patients with a history of allergy to penicillin. As with any antibiotic, observation for overgrowth of nonsusceptible organisms during treatment is important.

Usual Dosage Range: 125 mg. (200,000 units) three times a day to 250 mg. every four hours.

Supplied: Tablets V-Cillin K, 125 or 250 mg., and V-Cillin K, Pediatric, 125 mg. per 5-cc. teaspoonful, in 40, 80, and 150-cc.-size packages.

Professional Disciplinary Proceedings: What Constitutes Professional Misconduct

In three recent decisions the Appellate Division has unanimously given judicial sanction to administrative discipline meted out to three professionals: a pharmacist, a doctor, and a lawyer. For purposes of discussion it is not necessary to reveal the names of the individuals involved. Nevertheless, it is interesting to note the harshness of the discipline imposed, the revocation of the license to practice, and the reasons for the imposition of such a harsh penalty.

In the case of the pharmacist the Appellate Division for the Third Judicial Department found that he had been guilty of unprofessional conduct and refused to review a determination by the Board of Regents which had revoked his license. The pharmacist admitted that he did not make an inventory of the narcotics on hand in the hospital pharmacy when he ended his employment and that he destroyed certain inventory cards containing records of drugs dispensed to patients. The Court found that "[t]he uncontroverted proof in this record is sufficient to sustain the board's determination of unprofessional conduct. . . . It would be more difficult to conceive of actions more unprofessional than that of this pharmacist and his conduct in the hospital." [App. Div. 24 2d 694, 261 N. Y. Supp. 2d 410, 412 (3rd Dept., 1965)] The Court relied upon a regulation which provides that a pharmacist is guilty of unprofessional conduct in ". . . [w]illfully or knowlingly violating any Federal, State, or local law, regulation, or rule designed to protect public health by controlling the manufacturing, distributing, selling or dispensing of drugs and/or narcotics." [24 App. Div. 2d 694, 261 N. Y. Supp. 2d 410, 411 (3rd Dept., 1965)]

The doctor in question had been convicted upon his plea of guilty to a violation of a Federal statute in that he had tried corruptly to influence the due administration of justice. The crime was a felony under Federal law, but was only a misdemeanor under New York State law. For conviction of a misdemeanor professional discipline is permissive. The doctor was charged with unprofessional conduct and in a disciplinary proceeding his license was revoked. The doctor contended that the supposed unprofessional conduct for which discipline was imposed were unconnected with medical practice. Despite this contention, the Appellate Division for the Third Judicial Department approved the license revocation stating: ". . . unprofessional conduct on the part of a physician is not limited to acts directly relating to his treatment of patients. . . . [i]n our opinion the acts committed by the respondent were so heinous and wrongful as to negate the contention that respondent possesses the high degree of good character which is expected and

required of a member of the medical profession. The public has the right to expect from the members of the medical profession the highest degree of integrity. We find respondent's conduct was so reprehensive as to indicate that he does not possess such integrity and that such conduct reflects most unfavorably on the medical profession." [24 App. Div. 2d 698, 699, 261 N. Y. Supp. 2d 634, 635 (3rd Dept., 1965)]

Finally, the attorney refused to honor a *subpoena duces tecum* requiring him to produce his financial records and testify before a judicial inquiry investigating his conduct and practices as a lawyer. The attorney refused to do so on the grounds that his records and his testimony would tend to incriminate him and he was entitled to rely on the State and Federal constitutional provisions protecting him against self incrimination. The Appellate Division for the Second Judicial Department disbarred the attorney stating: "Our view, as previously stated, is that a lawyer, like any other citizen, has an absolute right to invoke his constitutional privilege against self incrimination and to refuse to supply the pertinent information; but that when a lawyer does so he fails in his inherent duty to the Court to divulge all pertinent information necessary to show his character and fitness to remain a member of the Bar and necessary to the proper administration of justice, and he must, consequently, forfeit his privilege of remaining a member of the Bar. . . . If he elects to invoke his constitutional privilege of self incrimination and thus avoid exposure to criminal prosecution—an election which undoubtedly is his to make—he cannot at the same time retain his privilege of membership in the Bar." [24 App. Div. 2d 653, 654 N. Y. Supp. 2d (2d Dept., 1965)]

From these decisions it is apparent that the courts sanction and impose severe penalties upon the conduct of professional men. Indeed, professional men as a class are examined for character and moral fitness before being licensed. Whenever their actions reflect adversely on their own character or moral fitness the courts may approve the harsh sanction of license revocation. Indeed, the courts seem to indicate that to retain his license a professional man may have to forego some of his most important and hallowed constitutional rights.

Your MEDICAL FACULTY at Work

JOHN SARGEANT — EXECUTIVE SECRETARY

COUNCIL, JANUARY 27

1. The Subcommittee on Alcoholism presented several recommendations, which were approved. The first, recommending that Baltimore City Hospitals establish a detoxification center as one of its health services, is to be referred to the Baltimore City Medical Society. The second, aimed at reducing the number of highway accidents caused by alcohol intoxication, calls for a system of probation, similar to that in the Municipal Court of Baltimore, to be set up in traffic courts throughout the state. Under such a system, defendants in whom alcoholism is a major or contributing factor would be sentenced to a special program of treatment for alcoholism. The third, to establish an industrial clinic for alcoholism and drug dependency, was approved on a one-year trial basis. Re-evaluation will be made after the first year's operation to determine whether continuing approval should be given.

2. A fee schedule guide, presented by the chairman of the Fee Schedule Committee, was approved with the understanding that amendments could be made as necessary.

3. Physicians defense was granted to various members requesting it.

4. Settlement of several cases was noted.

5. Emeritus membership is to be requested for Nicholson J. Eastman, MD, Baltimore City; Manfred J. Gerstley, MD, and Eugene Kester, MD, Kent County; and H. Dabney Kerr, MD, Talbot County.

6. Deferment of dues until July 1, 1966, with all rights and privileges for the year, was granted for a physician on a fellowship. Another member had his 1966 dues remitted because of illness.

7. The 1966 budget was approved.

8. April 9, 10, and 11 were the dates approved for the 1969 Annual Meeting.

9. Approval was given to holding the 1966 Semiannual Meeting at the Diplomat Motel on September 9.

10. The action of the Executive Committee in urging members to cooperate with Blue Shield in the conduct of a survey to determine "prevailing fee" was upheld.

11. In reply to a suggestion that service benefits under Blue Shield be waived when the patient elects to occupy a private room, Blue Shield explained in detail why such a policy would be inadvisable.

12. E. David Weinberg, MD, was approved as curator to succeed Mason F. Lord, MD, who died.

13. Various Blue Cross and Blue Shield appointments were approved.

14. Various legislative items coming before the General Assembly were considered:

A) An amendment to the Medical Practice Act was approved for submission to the 1966 General Assembly. This would permit the Board of Medical Examiners to "suspend" or "place on probation," compared to the current provisions which permit only revocation.

B) The principle of the law which would require the medical examiner's investigation of occupational deaths is favored, but the portion dealing with the necessity of obtaining consent for autopsy from the next of kin is opposed.

C) Senate Bill 46 is to be supported. This would change the insurance law dealing with reporting suspected instances of suit in

professional liability cases. The change would not permit carriers to place cases on "reservation of right" without good cause.

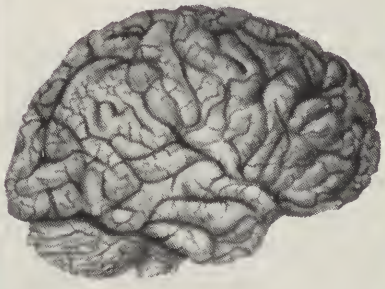
15. Action was deferred on the matter of civil rights compliance on medical care cases pending an opinion from AMA concerning correspondence from the Department of Health, Education and Welfare which would require a statement that compliance was being met with.

16. Pathologists, radiologists, anesthesiologists, and physiatrists are to be advised of the Faculty's support in connection with reimbursement for their services under Medicare.

17. The President was authorized to discuss with news media representatives actions taken at the special closed-session House of Delegates or to designate a spokesman in his stead. He was also authorized to designate a spokesman for the Faculty to answer questions for the news media when immediate information must be given.

18. The Council acted as follows on recommendations of the Policy and Planning Committee:

A) Approved supporting proposed legislation to protect local or state professional societies and medical staffs of local hospitals when acting in good faith in disciplinary matters.



B) Approved formation of a special committee to consider changes in the Medical Practice Act as they apply to unethical or unprofessional conduct and disciplinary procedures thereof, both for members and non-members.

C) Approved preparation of a program on Medicare for broadcast over the MEDIC network as soon as pertinent information is available.

D) Deferred until the March meeting action on a proposal calling for a pilot study covering three areas of medical practice in Maryland:
1) how medical care is being supplied, 2) what the people desire, 3) what is the best way to provide what they need. Money from

the most widely prescribed peripheral vasodilator...

the educational fund was requested for this study, along with a request that an effort be made to find a source for additional funds for complete study.

HOUSE OF DELEGATES, JANUARY 29 SPECIAL SESSION

1. A resolution was adopted providing for establishment of a 16-member committee, representing the various organized specialty groups in the state, to assist in clarifying specific contractual arrangements and to aid in negotiating ethical contracts. The Bylaws were amended accordingly.

2. Article XIII of the Bylaws was amended to give the Executive Committee of the Council judical powers in disciplinary matters and to spell out procedures for disciplinary action.

EXECUTIVE COMMITTEE, FEBRUARY 17

1. Monthly payments from the Cordell Fund will be continued for another year for a physician in need.

2. Financial participation in the Conference of Presidents and Other Officers of State Medical Associations was declined.

3. Certain changes in fringe benefits for Faculty personnel and retired personnel were adopted.

4. A recommendation was approved to hold, on a one-year trial basis, quarterly meetings for executive secretaries of the component societies, with expenses to be borne by the Faculty.

5. Inclusion of government installations in the MEDIC network was authorized, with the government to pay the cost of leasing land-line equipment, rental equipment, and installation charges involved.

6. A recommendation favoring a demonstration model of a community mental health center to be set up in Langley Park was approved, subject to its approval by

IN CIRCULATORY DISORDERS OF THE INNER EAR

where decreased blood flow results in hearing loss (sudden onset), tinnitus, or vertigo.

ARLIDIN®

the Prince George's County Medical Society.

7. A statement concerning administration by nurses of IV fluids, blood, and medications and another concerning closed chest resuscitation and artificial respiration by nurses were adopted.

8. John H. Hirschfeld, MD, was recommended as the Faculty representative on the Advisory group of the Regional Medical Program, P. L. 89-239.

9. Jack M. Zimmerman was selected to fill a vacancy on the Continuing Medical Education Committee.

10. A request to pay for the expenses of a speaker on alcoholism at the Peninsula General Hospital was denied because the Educational Fund has been designated for statewide benefit rather than local benefit. If and when a speakers bureau is developed, a request for blanket funds for its operation would then be considered.

11. Bills before the State Legislature were considered. The Executive Committee approves the amended bill concerning legalizing abortion after rape; opposes a bill calling for issuance of medical certificates at specified intervals in connection with individual ability to drive; opposes a bill establishing a board of dispensing opticians.

12. Use of Osler Hall was denied to the Maryland Chapter, Medical Committee for Human Rights, as membership of this organization does not fall within the policy established for use of Facutly facilities.

13. A request that dermatologists be represented on the Blue Shield Medical Relations Committee was denied, inasmuch as representation is not based on specialty.

14. Social Security has advised that Montgomery and Prince George's Counties will be included under the DC Blue Shield plan for fiscal purposes.

15. The Fee Schedule Guide and supplemental information is to be distributed to active members as soon as possible.

16. Blue Shield is to be commended for its activities in educating physicians and their office assistants in Medicare procedures and is to be asked to coordinate its activities with those of the Faculty in the same area.

EXECUTIVE SECRETARY'S NEWSLETTER

April, 1966

PREVAILING FEE PROGRAM OF BLUE SHIELD

All Prevailing Fee Program survey forms are being returned to individual physicians who submitted them by Maryland Medical Service.

The decision to take this action was reached by the Board of Trustees in view of the considerable amount of misunderstanding that apparently existed in connection with this Survey. Blue Shield plans to discuss this proposal with the Faculty, Component Societies as well as the various Specialty Groups during the next few months.

MEDICAL CARE FEE INCREASE

Included in the Health Department's 1967 Fiscal Year budget, commencing July 1, 1966, are sufficient funds for payment of $3.00 per office visit for medical care patients. No other fees were changed.

NEWS NOTES

Rafael Garcia-Bunuel, M.D., Baltimore, has been installed as Fellow of the American College of Obstetricians and Gynecologists.

Hak Suh Lim, M.D., Baltimore, has been certified as a Fellow of the American Society of Anesthesiology.

Jacob H. Conn, M.D., received the Presidential Certificate of Merit of the Society for Clinical and Experimental Hypnosis; as well as the Bernard B. Raginsky Award for, "leadership and advancement in the field of Hypnotherapy."

AD CAMPAIGN

The National Tuberculosis Association is embarking on a national educational campaign through ads in national magazines and periodicals. The principal purpose is to inform our citizens that chronic cough and shortness of breath may be early symptoms of disabling chronic obstructive airway disease. Those reading these ads are urged, "To See Your Doctor".

1966 GENERAL ASSEMBLY

Full details on the actions taken by the 1966 General Assembly have been mailed to all Faculty members via The Assemblyman. Additional information on specific bills may be obtained from the Faculty office.

IN THE WORKS

With the immense growth of legislation requiring physicians to report information to various governmental units, the need has become apparent that a compendium of such rules, regulations and requirements would be helpful to newly licensed physicians, as well as to others who have been in practice for some time.

This is presently under preparation and, hopefully, will be available within 2 - 3 months time.

PERSONALITIES

Russell S. Fisher, M.D., Baltimore, has been appointed chairman of the AMA's Committee on Medicolegal Problems.

REVISED COMMUNICABLE DISEASE REPORT

A revised Communicable Disease Report form, as well as listing of reportable disease, has been mailed to all Faculty members.

The new report forms, much simpler and easier to complete than previous ones, are available through the local health department.

Physicians are urged to comply with these new simplified regulations, as well as to cooperate in the national VD campaign by reporting promptly all cases of Venereal Disease that come to their attention.

UTILIZATION REVIEW COMMITTEES

With the advent of the Medicare law, hospital medical staffs will be required to have a Utilization Committee in the hospital, or in operation through the local medical society. The Faculty office offers assistance to local groups in the formation of such committees by providing background material, advice and other data.

An eminent role in medical practice

- Clinicians throughout the world consider meprobamate a therapeutic standard in the management of anxiety and tension.
- The high safety-efficacy ratio of 'Miltown' has been demonstrated by more than a decade of clinical use.

Miltown® (meprobamate)

Indications: 'Miltown' (meprobamate) is effective in relief of anxiety and tension states. Also as adjunctive therapy when anxiety may be a causative or otherwise disturbing factor. Although not a hypnotic, 'Miltown' fosters normal sleep through both its anti-anxiety and muscle-relaxant properties.

Contraindications: Previous allergic or idiosyncratic reactions to meprobamate or meprobamate-containing drugs.

Precautions: Careful supervision of dose and amounts prescribed is advised. Consider possibility of dependence, particularly in patients with history of drug or alcohol addiction; withdraw gradually after use for weeks or months at excessive dosage. Abrupt withdrawal may precipitate recurrence of pre-existing symptoms, or withdrawal reactions including, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, the dose should be reduced and operation of motor vehicles or machinery or other activity requiring alertness should be avoided if these symptoms are present. Effects of excessive alcohol may possibly be increased by meprobamate. Grand mal seizures may be precipitated in persons suffering from both grand and petit mal. Prescribe cautiously and in small quantities to patients with suicidal tendencies.

Side effects: Drowsiness may occur and, rarely, ataxia, usually controlled by decreasing the dose. Allergic or idiosyncratic reactions are rare, generally developing after one to four doses. Mild reactions are characterized by an urticarial or erythematous, maculopapular rash. Acute nonthrombocytopenic purpura with peripheral edema and fever, transient leukopenia, and a single case of fatal bullous dermatitis after administration of meprobamate and prednisolone have been reported. More severe and very rare cases of hypersensitivity may produce fever, chills, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, anaphylaxis, stomatitis and proctitis. Treatment should be symptomatic in such cases, and the drug should not be reinstituted. Isolated cases of agranulocytosis, thrombocytopenic purpura, and a single fatal instance of aplastic anemia have been reported, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity has been reported, usually after excessive meprobamate dosage. Suicidal attempts may produce lethargy, stupor, ataxia, coma, shock, vasomotor and respiratory collapse.

Usual adult dosage: One or two 400 mg. tablets three times daily. Doses above 2400 mg. daily are not recommended.

Supplied: In two strengths: 400 mg. scored tablets and 200 mg. coated tablets.

Before prescribing, consult package circular.

The Ultimate Hope

Our ultimate hope is complete eradication of cancer. Current research is bringing this goal ever nearer to attainment. Further investigations must be encouraged and the new knowledge put to practical clinical use.

MURRAY M. COPELAND, MD

As president of the American Cancer Society, I am privileged to give the Blessed Elizabeth Seton Lecture at St. Agnes Hospital this year. It was under the guidance and leadership of the distinguished surgeon and surgical pathologist, Dr. Joseph Colt Bloodgood, that I was first introduced to the cancer problem and encouraged to pursue a career devoted to finding the cause and cure of this dread disease. In the later decades of his life, Dr. Bloodgood did practically all of his surgery at this institution. It is with a sense of reverence and pride that I digress for a moment to speak of this great man whose shadow still falls across the portals of this venerable hospital.

History will record him as a dynamic man with robust physique, a contagious smile, and the inbred quality of a gentleman. In the evaluation of his career, his role as a surgeon pales in the light of his accomplishment as a surgical pathologist who brought the microscope into the operating room and, through the technique of the frozen section, had a great influence on surgical practice by bringing about the conservation of countless legs, arms, breasts, and other organs from mutilation. He will be remembered for his papers on tumors of bone and tumors of the breast and especially his interpretation of giant-cell tumors and chronic cystic mastitis as benign lesions and the handling of these disease processes by conservative measures. In the crusade against cancer, he was a cornerstone in the program of advocating the importance of the follow-up study as a technique for the evaluation of methods of diagnosis and treatment. May the results of his influence continue to have impact on the generations to come.

The ultimate hope of us all is to completely eradicate cancer through knowledge gained from research into the cause of the disease and its control which, in so many areas, remains an enigma. Current research in both clinical and basic science aptitudes is increasingly productive in the unremitting effort to unravel the problems which still confront us.

History will record that the people of our generation lived in one of those miraculous flowerings of the human intellect called a "Golden Age." Even now, man probes the cosmos—the nearby moons and planets and the distant stars. Even now, he explores the frontiers of knowledge within a single cell, a thousand of which could rest upon a needlepoint; and he tests there the reactions from infinitesimal amounts of en-

---

Blessed Elizabeth Seton Lecture, presented June 10, 1965, at St. Agnes Hospital, Baltimore. Dr. Copeland is president, American Cancer Society, Associate Director (Education); General Surgeon, Department of Surgery; Professor of Surgery (Oncology); The University of Texas M.D. Anderson Hospital and Tumor Institute, Houston.

zyme and nuclear material. He does all this at the opposite outposts of space—in the cosmos and in a single cell—to find further intimations of man's origin, method of growth, and mortality.

A keen observer of the research scene recently said that more has been learned about cancer in the past 15 years than had been learned in all previous history. What have we learned about this disease over the total span of our effective knowledge? Let me enumerate some of the important observations:

1. That cancer is hardly to be regarded as a single disease, so varied are its manifestations, its rates of growth, its susceptibility to treatment.
2. That more than 500 chemical compounds can cause it under the conditions of experimental control.
3. That certain environmental circumstances of living and working favor its development.
4. That heredity appears implicated in certain kinds of cancer.
5. That the cancer process, essentially one of rapid cell division, is focused in a minute part of the cell which triggers the fission of the cell, the nucleus, the essential protein and enzyme complexes of which are partly understood.
6. That the chemical requirements of the cancer cell differ, at least quantitatively, from those of normal cells.
7. That these specific reqirements may be frustrated by chemical means.
8. That hormones are evolved in the genesis and continued growth of some cancers and that hormones will restrain the growth of certain cancers.
9. That viruses are the cause, or part of the chain of causes, of a number of animal tumors, and that there is increasing evidence that they are in some way related to human cancer.
10. That there is a protective immune mechanism for cancer, as for bacterial invaders, which can be demonstrated experimentally.
11. That human cancer can now be made to grow indefinitely in animal hosts and in tissue culture after transplantation from humans.
12. That cancer is not an instantaneous conversion of a normal cell to a malignant one but is a developmental acquisition, a terminal phase of a series of changes.
13. That half of all cases of human cancer today can be cured, but, in fact, only about one-third are being saved.

Words familiar from long usage — viruses, genes, mutation, cancer—have begun to shift in their meanings and to take the form of oblique attempts to describe not separate entities but different manifestations of one particular and fairly well-defined type of chemical substance, DNA (deoxyribose nucleic acid). From this new vantage point, the argument about whether or not viruses "cause cancer" begins to seem outmoded, as it becomes clear to all engaged in such research that the link between cancer and viruses may be as strong as the coil of life itself.

This decade may well be memorable for the opening of a new front in the war against cancer. Some of the events we have predicted so hopefully and for so many years in such vague terms as "the foreseeable future," "in our time," or "eventually" actually seem to be coming to pass. Now. Today.

Brilliant scientists tell us of new facets of their work. Some of their findings and techniques even now are beting tested or applied for the first time against human cancer. In most cases, it is too early to tell how effective these findings or proposed curative measures will be.

We cannot be satisfied with present medical means for cancer control. We need not be. As I see it, these are some of the most urgent and practical measures we expect from science and medicine, some of which now are being tested experimentally in humans as well as in the laboratory:

1. Blood, urine, and biochemical tests which will indicate not only the presence of early and hidden cancers but also an individual's susceptibility to specific cancers.
2. The detection of hidden cancer viruses of cancer-causing organisms and the designing of drugs which will inhibit their growth or destroy them.
3. The development of safe and effective vaccines to prevent specific cancers.
4. The application of immune measures—vaccines, antisera, antibodies, sensitized lymph cells, immunity stimulants, lytic enzymes,

interferon, and other substances—which directly or indirectly may suppress cancer growth.

5. Widespread public knowledge of the chemicals which cause cancer in experimental animals and their elimination, as much as possible, from man's food and environment.
6. Exact information on the biological activity of x-rays for the guidance of physicians, dentists, and others who use this cancer-causing and cancer-curing medium.
7. New and better anticancer drugs and their use, alone or in combination with surgery, radiation, and immune measures, with maximum effectiveness and safety.

Progress in cancer research during the past 10 years has led to the current interest in the role of viruses in the development of human cancer. Many new viruses have been discovered in man, and many cancer viruses in animals, only to mention leukemia virus and the multipotent gland tumor virus of mice.

Recently, a malignant lymphosarcoma was reported in children of certain regions of Africa. The disease affects Negro, Asian, and European children, alike. It is, therefore, a disease not of Africans but of Africa. Closer examination has revealed that these children with lymphosarcoma have other types of tumors, also, in their bodies. Only those children who live in certain regions at low altitudes and of small rainfall are affected. The present question is whether mosquitoes or tsetse flies are involved in the transmission of the disease, as the regions correspond with those where these vectors abound in Africa. Cattle in Africa also have been reported to be affected by this syndrome of tumors. It is not yet known whether this disease is virus-induced, but viral-like bodies have been found in the blood and lymph nodes of both cattle and humans with this disease, strongly suggesting that this may be so.

Leukemia and lymphosarcoma in cattle have recently received increasing attention. Some herds of cattle in this country and in Scandinavia have an incidence of leukemia as high as 80%. It has been shown that the disease is transmitted both vertically and horizontally by unknown means. The question arises whether virus in cattle, as in leukemia of mice, may not be transmitted by mother's milk. Dr. Dmochowski of The University of Texas M.D. Anderson Hospital and Tumor Institute has recently found viruslike particles, as yet of unknown activity, in the milk of leukemic cattle. This problem is receiving his great attention. Even if these viruslike particles are found to be the responsible agent, it is still a far cry from answering the question: can milk of such cattle be responsible for some cases of leukemia in man? This fact of the problem is being studied.

In 1957, Dr. Dmochowski first demonstrated viruslike particles in a lymph node from a child with acute lymphatic leukemia. More extensive study has since been carried out on biopsy material from lymph nodes of patients with acute and chronic forms of leukemia, Hodgkin's disease, and lymphosarcoma. In some of the cases of acute leukemia, viruslike particles have been found in the leukemia cell cytoplasm as well as in one or two cases of lymphosarcoma. These findings have been confirmed by Dalton and Maloney, of the National Cancer Institute, in 16 of 20 patients with acute leukemia. The particles were not present in patients used as controls. While a virus has not yet been demonstrated as the cause of human leukemia, the abnormal particles found in these cells may prove to be a contributing factor.

In papilloma of the larynx, viruses have generally been suspected as being the causative agent. This tumor is clinically potentially serious because of its location on the vocal cords or any other part of the larynx and because of its tendency to recur after removal. While most common in children, it also occurs in adults, frequently leading to squamous cell carcinoma.

Heretofore, characteristic viruslike particles have been observed in human skin warts and in molluscum contagiosum, an infectious benign tumor of the skin in man. Recently, Dr. Dmochowski and his associates have prepared laryngeal papillomas from a number of cases, both children and adults, for electron microscopy. Examination of the first case of recurrent laryngeal papilloma in a 50-year-old man has revealed the presence of great numbers of characteristic viruslike particles in the nuclei of cells. Similar viruslike particles have also been found in a second case of laryngeal papilloma in a 2½-year-old girl. The viruslike particles are similar in size and location to virus particles of human skin wart, papilloma of rabbits and, in appearance

and location, to virus particles of polyoma of mice and of SV-40 virus of monkeys. Although this is a first demonstration of viruslike particles in cells of human laryngeal papilloma, further studies will be required to establish their causative relationship to the tumor.

Dr. Breslow, of the University of California's Public Health Department, who is a member of the American Cancer Society's board of directors, calls cancer a pre-eminently social disease and says that those who would understand its genesis and work toward its control must look upon it as a public health problem. He defines it is a social disease in at least three major respects: 1) social conditions contribute heavily to its cause, 2) social measures are required for its control, and 3) the social and economic circumstances and pressures that influence each case must be understood and respected.

While there appear to be more than 300 different types of cancer and probably hundreds of causes, few doubt any longer the statistical and laboratory evidence that cancer has social and cultural causes. Typical examples include the higher incidence among certain miners, the carcinogens found in food additives and farm chemicals, the high leukemia incidence among the people of Hiroshima, and the apparent cause-and-effect relationship between heavy cigarette smoking and lung cancer.

As evidence of socioeconomic influences on the course of cancer, a recent survey in California uncovered these facts, among others:

1. One out of every four patients had failed to follow through with the medical or surgical treatment recommended by his physician.
2. One in three had been afflicted by serious family or emotional problems before entering the hospital.
3. Three out of five faced even more serious problems after leaving the hospital.

While the survey indicated that some patients failed to follow through with treatment because of their refusal to accept the implications of an apparently hopeless diagnosis, it was evident that most were influenced by emotional problems, financial worries, or the immediate problem of family responsibility. In view of the fact that the outlook for patients who follow through with treatment is far more hopeful, it is evident that we could save thousands of lives with an intensive effort to ease the problems, the resistances, and the fears that beset so many of them.

A splendid tool for understanding the public health aspects of cancer is California's Tumor Registry, which now contains on the tapes of its computers a 21-year record of the case histories obtained from more than 250,000 cancer patients. From these records, Dr. Breslow has extracted evidence indicating what he calls the "class consciousness" of cancer and its treatment:

1. Cancer of the cervix is twice as frequent in the lowest income group as in the highest.
2. Among men, lung and stomach cancer strike the lowest income group twice as frequently as it does those with the highest incomes.
3. Only one-third of the cancer patients in county hospitals had received the benefits of early diagnosis.
4. As a result of earlier diagnosis and better treatment, 62% of private hospital patients with cancer of the cervix lived five years or more; only 39% of the county hospital patients lived five years.
5. In California's Alameda County, two-thirds of the women in the highest social class had received at least one Papanicolaou vaginal smear test; less than one-third of those in the lowest economic group had received such a test.

It is unfortunate that those with the greatest need should benefit least from the most effective means now available for cancer control. Correcting the imbalance will require serious organized effort. Individual education must be reinforced by a network of responsibility.

At best, our knowledge of how to control cancer is modest, if mortality statistics are a good index. Yet this is an unwise conclusion, because our knowledge of the origins, treatment, and possible cure of the disease is catching up with the challenge.

While we must observe every caution in protecting cancer patients from overt or occult ill effects of new medical preparations and techniques, no time should be lost in making new medical discoveries available. The medical value of a scientific discovery is only as great as its

application to human health problems. The medicine which for centuries has served only primitive tribes is of no value to populations too preoccupied or too sophisticated to test it. This for a long time was the case with tranquilizers. Biological principles which are buried with their discoverers—Mendelian genetics is an example—are of no value until they are rediscovered by a more curious, more tolerant, and more alert generation.

In the present information explosion, in which thousands and thousands of journals inundate us with more or less unsorted facts, artifacts, figures, charts, observations, speculations, and logical and illogical conclusions, there is risk that we may be ignoring some of the biological keys of cancer control. This we cannot afford. It is incumbent upon us to devise a system for exploring any promising avenue against cancer opened by an honest and competent investigator. I believe that the enthusiasms of scientists for their work should be encouraged; cynicism will never cure cancer.

Beyond the difficult job of developing new knowledge is the equally formidable task of applying the solutions arrived from basic research to clinical problems. The life-saving experimental technique will save few lives if it is not tested by capable and conscientious physicians, if it is not shown to be reproducible, and, once found practical, if it is not generally adopted and made available to patients requiring it.

I wish to quote the epilogue from the Sloan-Kettering Institute for Cancer Research, Progress Report for 1962, as an expression of our hope for the future:

> One hundred years ago, a haphazard, seemingly meaningless collection of scientific data was suddenly fused into a synthesis that altered forever not only the course of biological sciences, but the entire pattern of human health and welfare, when Louis Pasteur delivered, at the Sorbonne, his famous lecture on spontaneous generation and announced the germ theory of disease.
>
> Once more we are groping in the strange twilight between the living and the non-living for unifying concepts of a great mass of curiously related information. Everywhere we direct a pinpoint of light, the mind is confronted with events as miraculous as the formation of life from a shining drop of synthesized DNA. Predictions are not only presumptuous at such a time, but they appear pale and unimaginative when contrasted with the facets of on-rushing event.
>
> We have every hope that these discoveries may ultimately mark the end of some of mankind's cruelest diseases; we are permitted to hope also that they will liberate the mind to travel further and further into unexplored regions, at least as exciting and full of promise as the frontiers now beckoning beyond the distant stars.

It must be apparent to all of you today that we are witnessing the beginning of a revolution in the biological sciences that will far surpass the great revolution in the physical sciences that culminated in the discovery of nuclear power.

It is not expected that the problem of cancer will be solved in a sudden flash of discovery. Trained investigators all over the world are seeking parts of the scientific jigsaw puzzle which, when fitted together, should give the complete picture. Holding these workers together is the ever expanding body of knowledge in a wide spectrum of scientific disciplines. With our scientific know-how, economic strength, and professional leadership, I am confident that discoveries extant and to come will ultimately mark the end of one of man's cruelest diseases. God speed the day!

A Key Site of Action of the Protoveratrine A in Salutensin

"The main function of the carotid sinus is regulation of the blood pressure...."[1]

The veratrum component of Salutensin acts here (and in the myocardium), initiating "...a reflex fall in blood pressure through a generalized vasodilation and fall in heart rate."[2]

SCHWENK

This is a logical Blood Pressure Regulator

BECAUSE IT ENHANCES THE BODY'S OWN MECHANISMS FOR REDUCING BLOOD PRESSURE

n mild
o moderate hypertension:

alutensin enhances the body's own
echanisms for lowering blood
ressure. The veratrum component
f Salutensin acts on the carotid
inus and myocardial receptors,
nitiating "...a reflex fall in blood
ressure through a generalized
asodilation and fall in heart rate."[2]
o achieve this reflex modification
f hypertension, Salutensin
tilizes protoveratrine A.
n addition, to facilitate and
naintain blood pressure reduction,
alutensin incorporates reserpine
nd a highly effective thiazide.
n general, side effects have been reported infrequently but may include those listed in the therapeutic summary.

Simple dosage—low-cost therapy: Many patients on Salutensin respond to 1 tablet *b.i.d.* Long-term economy is assured, since dosage can frequently be lowered after initial control is established.

Available: Prescription-size bottles of 60 tablets.

References: 1. Editorial: JAMA *191*:592 (Feb. 15) 1965. 2. Meilman, E., in Moyer, J.H.: Hypertension, Philadelphia, W.B. Saunders Company, 1959, p. 395.

BRISTOL THERAPEUTIC SUMMARY
For complete information consult Official Package Circular.
Indications: Essential hypertension.
Warnings: Small-bowel lesions (obstruction, hemorrhage, perforation) have occurred during therapy with enteric-coated formulations containing potassium, with or without thiazides. Such potassium formulations should be used with Salutensin only when indicated and should be discontinued immediately if abdominal pain, distention, nausea, vomiting or gastrointestinal bleeding occurs.
Contraindications: Salutensin is contraindicated in severe depression.
Precautions: Azotemia, hypochloremia, hyponatremia, hypochloremic alkalosis and hypokalemia (especially with hepatic cirrhosis and corticosteroid therapy) may occur, particularly with pre-existing vomiting and diarrhea. Potassium loss, which may cause digitalis intoxication, responds to potassium-rich foods, potassium chloride or, if necessary, stopping therapy. Serum ammonia elevation may precipitate coma in precomatose hepatic cirrhotics. Discontinue therapy two weeks before surgery or if myocardial irritability, progressive azotemia or severe depression occur. Exercise caution with patients with peptic ulcers or renal insufficiency (if severe, Salutensin is contraindicated).
Side Effects: Hydroflumethiazide: Purpura plus or minus thrombocytopenia, hyperuricemia, leukopenia, hyperglycemia, glycosuria, malaise, weakness, dizziness, fatigue, paresthesias, muscle cramps, skin rash, epigastric distress, vomiting, diarrhea and constipation. *Reserpine:* Depression, peptic ulceration, diarrhea, Parkinsonism, nasal stuffiness, dryness of the mouth and, with overdosage, agitation, insomnia and nightmares. *Protoveratrine A:* Nausea, vomiting, cardiac arrhythmia, prostration, excessive hypotension and bradycardia. (Treat bradycardia with atropine and hypotension with vasopressors.)
Usual Dose: 1 tablet *b.i.d.*

BRISTOL LABORATORIES
Division of Bristol-Myers Co.
Syracuse, New York

Salutensin®

Each tablet contains:
protoveratrine A, 0.2 mg.;
hydroflumethiazide, 50 mg.;
reserpine, 0.125 mg.

BRING THE TREATMENT TOGETHER
IN A SINGLE PRESCRIPTION

ACHROCIDIN®

Tetracycline HCl-Antihistamine-Analgesic Compound

Each tablet contains:			
ACHROMYCIN® Tetracycline HCl	125 mg	Caffeine	30 mg
Acetophenetidin (Phenacetin)	120 mg	Salicylamide	150 mg
		Chlorothen Citrate	25 mg

Effective in controlling complicating tetracycline-sensitive bacterial infection and providing symptomatic relief in allergic diseases of the upper respiratory tract. Possible side effects include drowsiness, slight gastric distress, anorexia, overgrowth of nonsusceptible organisms, tooth discoloration (if given during tooth formation), photodynamic reaction to sunlight and increased intracranial pressure (in young infants). Contraindication: History of hypersensitivity to tetracycline. Average adult dosage: 2 tablets four times daily, given at least one hour before, or two hours after meals. Patient should avoid direct exposure to artificial or natural sunlight; and should not drive a car or operate machinery while on drug. Reduce dosage in impaired renal function. Stop drug immediately at the first sign of adverse reaction.

A Presidential Address

CRITIQUE OF THE MEDICAL PROFESSION

SAMUEL MORRISON, MD
Past-President, Baltimore City Medical Society

While I realize that in some quarters praise is richly deserved, I am not here tonight to praise the medical profession. I am well aware that no other group of people has quietly and unselfishly done more than the medical profession to carry out its utmost reasons for existence; namely, the health of the people, the education of its colleagues, students, and patients, and the basic research so essential to it all.

But my message tonight is one of constructive criticism. Here we are—educated and presumably wise men; yet our horizons are so limited. Why are physicians so conservative—if not reactionary? Why do we see communism and socialism in every attempt at social change? Why do so many doctors fight to maintain the status quo in this rapidly changing world? Why do we not recognize that socio-economic problems, slums, problems of population explosion, political problems, individual rights, crime and punishment, problems of the atom and nuclear devices, of automation, of jet propulsion—are *our* problems, too—problems that require bold and original solutions? Why are we so obsessed with the need to hold the line? What line? The line of an era we have outgrown? Why do we fight our own government instead of taking a positive, constructive position of leadership? It has been said that minds are like parachutes, they only function when open.

It is comforting to know that the things which concern me concern many of us, such as the urgent need for us to participate in health planning under Medicare. It should not be obstructed by those who think that non-participation brings solutions. There will be a need for continuous study of the actual results of this great experiment. These studies should be undertaken by specially organized groups under private auspices, the objective being to evaluate and improve the laws under which we administer medical care for the aged and perhaps other programs which undoubtedly will be forthcoming.

In 1916, a committee report to the AMA House of Delegates contained this admonition:

> Blind opposition, indignation, repudiation, bitter denunciation of these (social) laws is worse than useless. It leads nowhere and it leaves the profession in the position of helplessness if the rising tide of social development sweeps over them.

These prophetic words were not heeded then, nor yet in 1965, when the AMA showed no real willingness to compromise; made no move to have a part in framing the law that would inevitably emerge from the new Congress, though they must have been reminded that their own House of Delegates once endorsed a compulsory national health insurance program. "The time has come when we can no longer resist the social movement," the Board of Trustees said in 1916, "and it is better that we should initiate the necessary changes than have them forced on us."

It is true that yesterday political activity gave

Delivered before the Baltimore City Medical Society, December 3, 1965.

us little concern. Yesterday we were content to practice the art of medicine, but today we are being forced into the political arena, and we must realize that in the future many facets of medicine will be subject to political influence. Certainly we sometimes long for the "good old days," when the medical society was concerned solely with fighting disease and protecting the physical and mental health of the community. They were easier and very pleasant, but the real world is about us and demands our participation. Medicine today is more than ever bound up with life and death, with Vietnam, with revolutions, with the political right and left, and with the many other social and political problems of our nation.

One vital problem is the spiralling cost of medical care. Who is to blame? Patients seem to have a blind spot: they demand more personal care in a machine age in which they themselves are partly responsible for the rising costs. They have some mistaken idea that the more tests which are done, the more likely the diagnosis will appear. They do not realize how expensive some of these tests are. They seem to think that because the tests are paid for by someone else, the more the better.

Doctors, too, are to blame. They agree to the ordering of more and more tests. The teaching programs of the hospitals are expensive, sometimes wasteful, and not always well organized. The personnel itself is expensive. According to a fee schedule of the American Society of Internal Medicine, doctors' charges have increased to a point where they must be reflected in insurance rates and other interrelated costs, thus adding to the inflationary spread. Its aims and purposes are documented, but one of the reasons for the founding of the American Society of Internal Medicine was to establish higher fees for internists. But it is *not true,* as one of our colleagues charged, that the doctor's dominant motivation is money. Such an unfair accusation could only have been made by one who does not practice on a fee for service basis with his patients.

Even the government is abetting the rise in medical care costs. Certainly the original concept of taking care of the ill who cannot afford care is acceptable. But some of the governmental programs with their unfairly low fee charges of $2.50 for office visits often lead to more office visits and more prescribing than seems proper. Thus, by degrees, we are being drawn into a system which we recognize as undesirable.

I have neither the knowledge nor the fortitude to discuss all the phases of health insurance, what they offer, what they really give; but I can tell you how wrong it is to sell insurance which offers, for example, to pay the cost of x-rays only when they are done in the hospital. Our hospitals cannot even take care of all the sick promptly; yet these programs are accepted and patients are hospitalized for these purposes. I cannot approve of the policy of some hospitals—a policy often ignored by Blue Cross—which refuses to accept a patient's Blue Cross until a semi-private accommodation is available. It is like selling something which is not available to the public.

The rates in the hospitals reflect the many increasing costs. I believe we, the medical profession, should set an example and hold down excessive financial demands on people at their worst time—when they are sick.

Apropos of hospitals, I for one am awfully tired of being asked by a lay person in some of our admitting offices why a particular patient needs to be admitted. And how does one react to an admitting clerk who acts stunned when called for the admission of a patient? These practices are condoned by the hospital authorities, I presume because the person in such a frustrating job is doing the best that can be done. Yet, such a person has no right to practice medicine.

To return to the matter of spiralling medical costs, anyone—physician, hospital administrator, government agency, insurance carrier, patient—who has anything to do with a visit not essential, a prescription not necessary, a test not required, the use of equipment and personnel in treatment not indicated, who condones actions which adversely affect the service, or who bows to demands which his judgment tells him are unwarranted, is contributing to the spiralling cost of medical service. And it is the cost of medical service which will, in the final analysis, determine the degree to which our profession will be able to resist the encroachments of the government and the measure of control we can retain over our own destinies.

I have always been concerned about the lack

of accreditation of hospitals in our community. I believe that only when all the hospitals of this community regard lack of accreditation in any one of them as an obligation on all of them, will we have arrived at a mature attitude. I do not see why any hospital in our area should be unaccredited. Nor do I see any sense to partial accreditation, whereby, for example, the surgical or gynecological service is accredited but not the medical service.

Community hospitals should not periodically fear loss of accreditation. As an example, they are told, "Your outpatient clinics do not have enough patients"; so the hospitals are compelled to drum up more patients. Why should chiefs of services, administrators, and accrediting bodies lay down rigid rules which treat us as if we are irresponsible and make for dodges and tricks which are unbecoming to mature physicians? The common point in these examples is sterile thinking. Conformity and uniformity have become ends in themselves. But why? Was Edison a conformist?

Accrediting bodies should advise, assist, and promote. They should not threaten or coerce or punish. Are not honor, integrity, and responsibility part of our unwritten code? To be periodically confronted by the spectre of accreditation represents a drain on energies which might be better expended in other directions.

Dr. Irvine H. Page, in writing about the new *Journal of the Reticuloendothelial Society,* commented:

> Clearly the day of intense specialization is with us and, equally clearly, if specialization proceeds in a narrow path without relationship to other paths of knowledge, our great body of knowledge will end up in limbo.

Dr. Page calls for vigilance to see that we, personally, our specialty boards, and our societies do not demand conformity to the point of preventing creation of a broadly conceived and relatively homogeneous body of medical knowledge.

> While being specialists, we still must be generalists; while being physicians, we still must be scientists; and lastly, while being scientists we still must be men. It is a big order, and we can only succeed if we help each other, a cardinal principle of medicine and science too often forgotten.

Dr. Jacob K. Berman, in an article entitled "Survival With Prestige," reminds surgeons to treat the patient as a whole, not as a number, an experimental problem, or an illness. He recalls that almost a century ago, Jonathan Hutchinson said, "It is more important to know the patient than his disease." It may become more important, I add, to know our society.

Basically I have great affection for my colleagues, and I am sure that they have as much sentiment as I. I would like to see a little more humor, a few well meant smiles. This is what helps to make men great. I would like to see less moral indignation among certain groups of physicians. What concerns me about indignation is that it should not be so cynically selective.

I do not see among my colleagues a display of emotional response such as that shown by Sir Winston Churchill, when he said, "In war, resolution; in defeat, defiance; in victory, magnanimity; in peace, good will."

In contrast, Americans have been accused of spending too much time in competitive enterprise, in bettering last year's effort, in commercializing everything they touch. But The Almighty would not wish it this way. There is so much compulsion, dogged determination, perseverance, and persistence on an issue such as corporate medicine, when all of us know how we stand, and we know how well this symbiotic relationship has worked over the years.

Two hundred years ago the poet Robert Burns wrote, "Oh wad some Pow'r the giftie gie us, to see oursel's as ithers see us." And Lincoln, in his last inaugural address, said, "With malice toward none, with charity for all, let us try to bind up the nation's wounds." Perhaps we need a period during which we should bind up our own wounds.

It is true that sometimes we have no choice in our enemies, but have we as many enemies as we imagine? Is, for example, the government our enemy? We decry governmental interference in medical care programs and enforcement of drug standards, yet we clamor for federal funds for research and hospital construction. We fear big government, yet the upsurge of crime and violence make us demand federal action. Expedience should never come before humanity, and I am sure the test of conscience will not find us wanting.

In the *Johns Hopkins Magazine* for March, 1965, James Reston asks if we are ready for the Great Society. We should behave toward our country, he said, quoting J. B. Priestly,

as women behave toward the men they love: a loving wife will do anything for her husband except to stop criticizing and trying to improve him. This should be the attitude of a citizen, suggests Mr. Reston. He raises such provocative questions as, "Which is more important, the conquest of the moon at $5 billion a year or the education and housing of the poor?" And he ends on the optimistic note of Justice Holmes: "Beyond the vision of battling races and an impoverished earth, I catch a dreaming glimpse of peace."

Let me address myself to the all-important point. How broad *is* our horizon? Wake up, profession! Wake up, MD's! So often we win a battle and lose the war; we win a point and lose the issue. One of our troubles is that between the young geniuses in high positions and the older ones who wish to live in the past, we fail to make use of the fertile minds of many mature, wise, and experienced men in the middle group, men who know when to compromise, men who know that step by step progress leads to the desired objective. Man was never meant to be one dimensional. Progress lies not only in conformity but in the development of new ideas.

Excluding those who do not even participate, there are so many who talk but never listen, who look but never see. Yet the world is crying for intelligent interaction between human beings. Let us talk sense amongst ourselves and to our patients and hope that they in turn will talk sense to us. It is not right for us to stay above the battle; to remain aloft is to die before life begins, and it is when good men do nothing that others take over. We must be mindful of the lessons of the past; we must be alert and responsible in facing the problems of the present; we must be creative and courageous in meeting the challenges of the future, and we must not let the pressures of our troubled times swerve us from these objectives.

Dr. Howard P. Lewis, in an article entitled "Reflections From Our Mirror," in the *Annals of Internal Medicine,* said,

> We must recognize that today we are less close to our patients than we should be and that we have not taken into full account, as individual physicians, that we and our times have changed.

There is no question that the physician, busy as he is, must find time to participate to a greater degree in many important and demanding civic and professional activities because these have become expected of him. Community leadership as a whole has a tremendous role to play in redirecting and reorienting basic thinking to encourage a little less negativism, a little more positive approach, a little less emotionalism, and a little more common sense.

Amidst great material well-being, our culture stands in danger of losing its very soul. The state of the humanities today creates a crisis for national leadership. Mankind is nothing without individual men whose minds are able to take part in a revolution and to make their contribution for all.

This is so different from a recent note I read about television, which concluded that it makes the most money by catering to the biggest audiences, that culture does not pay, so the heck with it.

Medicine's limitless horizons are before us. They are inspirational. The monolithic society is no more. Motivation and responsibility are basic to progress. Might we not aspire to having a medical man in the cabinet, one who enjoys both the confidence of the President and the confidence of his colleagues? One who would take part in policy-making rather than obstructing it, or coming up too late with too little?

In an address titled, "Time Does Not Permit," Dr. Ingelfinger made some interesting comments, among which was that he had many ideas that impressed him as most important which he could, unfortunately, not impart to his listeners because time did not permit. I know this feeling.

I have indulged myself in your valuable time. I have undoubtedly stunned many of you, angered more; but I, too, have been stunned and angered during this year as president. I have been hurt. No casts are visible, but I have aged, and my brain tells me that the wounds have seared deep into my soul. I am worried about our future in terms much broader than the medical profession has allowed itself to envision. I implore each of you to ask yourself the profound question: Do we want leadership in this amazing century, or do we want to hold the line? Do we wish to be above or below or in the battle? We have a choice. I have made mine.

11 East Chase Street
Baltimore, Md. 21202

ECONOMY

When you prescribe or recommend Allbee with C, you can be sure your patient is getting a rational, specific multivitamin formulation at an economical price. The potent formula is sensible and simple. It contains therapeutic amounts of the water-soluble B and C vitamins. These vitamins are expended rapidly in the body and need to be replenished frequently. There are no extraneous factors, no frills in Allbee with C. It's the no-nonsense vitamin in the yellow and green capsule that always gives your patient his money's worth.

Each capsule contains: Thiamine mononitrate (B_1), 15 mg.; Riboflavin (B_2), 10 mg.; Pyridoxine hydrochloride (B_6), 5 mg.; Nicotinamide, 50 mg.; Calcium pantothenate, 10 mg.; Ascorbic acid (vitamin C), 300 mg.

—a good reason for AHR

ALLBEE® WITH C

THERE'S NOTHING
LIKE A VACATION*
FOR RELAXING
STRESS-INDUCED
SMOOTH MUSCLE
SPASM . . .

NOTHING, THAT IS,
EXCEPT THE SEDATIVE-ANTISPASMODIC
BENEFITS OF

DONNATAL®

There's nothing quite like a vacation to ease the pressures of the modern, "workingday" world. And for the patient who can't get away from it all, there's nothing quite like Donnatal to relax stress-induced smooth muscle spasm. For 31 years it has been the antispasmodic-sedative most often prescribed for relieving functional disturbances of tone and motility of the gastrointestinal tract.

belladonna alkaloids in optimally balanced ratio

In Donnatal, natural belladonna alkaloids are rationally balanced in a specific, fixed ratio that provides "the greatest efficacy with the smallest possible dose."[1] They avoid the clinical uncertainties of the variable tincture and extract of belladonna, and are considered superior in range of action to atropine alone.[2] Furthermore, they are generally recognized as being more effective than the synthetics for relieving visceral spasm.

phenobarbital for sedation

Years of clinical use have established phenobarbital as one of the most efficient and highly regarded sedatives. In fact, for general sedation it is the drug of choice.[3] In Donnatal, phenobarbital potentiates the spasmolytic effects of the belladonna alkaloids, lessening emotional tensions and checking the neurogenic impulses that trigger GI disorders.

more than 24 indications in PDR

Donnatal has withstood the test of time to become the classic sedative-antispasmodic because of its unsurpassed effectiveness, safety, economy, uniformity of composition, and dosage convenience. Its widespread acceptance and usage by the profession can also be attributed to its versatility in treating disorders characterized by smooth muscle spasm. There are more than two dozen distinct and separate indications for Donnatal listed in the current PDR.

IN EACH TABLET, CAPSULE, OR (5 cc.) OF ELIXIR

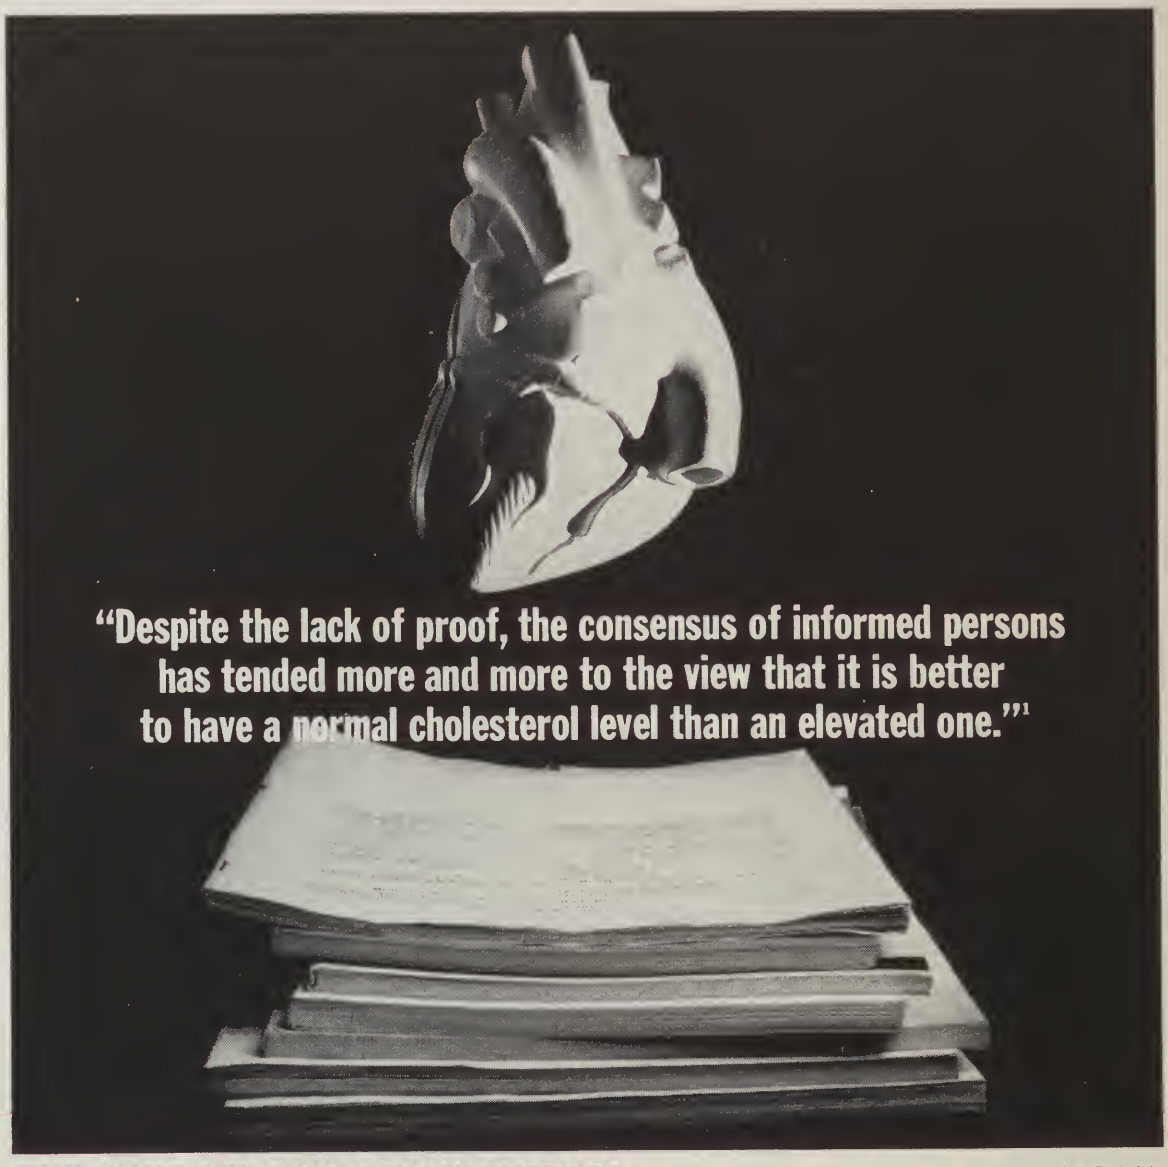
hyoscyamine sulfate	0.1037 mg.
atropine sulfate	0.0194 mg.
hyoscine hydrobromide	0.0065 mg.
phenobarbital	(1/4 gr.) 16.2 mg.

(warning: may be habit forming)

IN EACH EXTENTAB

hyoscyamine sulfate	0.3111 mg.
atropine sulfate	0.0582 mg.
hyoscine hydrobromide	0.0195 mg.
phenobarbital	(3/4 gr.) 48.6 mg.

(warning: may be habit forming)



BRIEF SUMMARY: Blurring of vision, dry mouth, difficult urination, and flushing or dryness of the skin may occur on higher dosage levels, rarely on usual dosage. Administer with caution to patients with incipient glaucoma, or urinary bladder neck obstruction. Contraindicated in acute glaucoma, advanced renal or hepatic disease, or a hypersensitivity to any of the ingredients.

THE DRUG TO LOWER CHOLESTEROL...

NICALEX®

(ALUMINUM NICOTINATE)

- ☐ Reduces cholesterol by 15-30% in most patients[2]
- ☐ Matches nicotinic acid in effective reduction of elevated serum lipids—but with minimized tendency to cause flushing[3]
- ☐ Simpler, more practical than diet[1]

WALKER Laboratories

Division of Richardson-Merrell Inc., Mount Vernon, New York 10551

NICALEX Prescribing Information: COMPOSITION: Each tablet contains: Aluminum Nicotinate 625 mg.—a complex consisting of (approx.): Aluminum Hydroxydinicotinate 450 mg. and Nicotinic Acid 155 mg. (Equivalent in activity to Nicotinic Acid 500 mg.) INDICATIONS: The primary indications for NICALEX (Aluminum Nicotinate) are to reduce the serum cholesterol and total lipid levels in hypercholesteremia and hyperlipemia. It may also be useful in reducing xanthomatous tissue cholesterol deposits. PRECAUTIONS AND WARNINGS: Patients with peptic ulcer, liver, or gallbladder disease should be observed closely while taking the medication. Diabetic patients may require adjustment of diet and insulin dosage in the event of decreased tolerance. Patients receiving anti-hypertensive drugs of the adrenal-blocking type should be watched for signs of postural hypotension. Occasional side effects of Nicotinic Acid in large dosage are decreased glucose tolerance (resembling diabetic-type curve) sometimes with glycosuria, temporary activation of peptic ulcer, transient jaundice, and metabolic disturbance of liver function without definite hepatic pathology. These side effects were found to be reversible upon discontinuing nicotinic acid therapy. Certain transitory skin changes have been observed with nicotinic acid therapy. These include: dryness of the skin and keratosis nigricans, particularly in axillae. SIDE EFFECTS: Administration of NICALEX (Aluminum Nicotinate) may produce temporary flushing and pruritus, also mild gastrointestinal distress, but these reactions are transient and apparently not serious. DOSAGE: The adult dose is 2 to 4 tablets t.i.d. with meals. HOW SUPPLIED: In bottles of 100 and 1000. CAUTION: Federal law prohibits dispensing without prescription. REFERENCES: 1. BREAST CANCER

Current Concepts in Clinical Management

The breast is the number one site of cancer in women; in the United States it is the leading site of cancer incidence regardless of sex. Four aspects of the problems and management of breast cancer are considered here: history taking, mammography, castration, and treatment.

EDWARD F. LEWISON, MD
Breast Clinic, Johns Hopkins Hospital

Among the many polished phrases and published wit of the late and great President Kennedy is the remark, "When things are noncontroversial, beautifully coordinated and all the rest, it must be that there is not much going on." This certainly can't be the case for the polemics and problems of breast cancer, where contradiction and controversy are rampant and so often regarded as stubborness versus stupidity. Even men of moderation who are unwilling to accept the comfortable cliché and traditional techniques and teachings of our predecessors are frequently considered the devil's allies in this disease —those who doubt are damned! However, these nonconformists are often the martyrs of science consecrated to the cause of truth. By challenging our current dogma they enrich the science of surgery and enhance the progress of our medical profession. As noted by Sir William Ogilvie,[11] "It is an ancient and fundamental problem of all institutions to combine security with progress, tradition with discovery"—and surgical orthodoxy with heterodoxy.

Before considering specific subjects pertaining to the practical problems of breast cancer and its clinical management, I would like to define the magnitude of this disease in broad general terms. Cancer of the breast has a worthwhile distribution and is in truth an arrant "world citizen" whose cellular turmoil shows little predilection for race, country, or geographic distribution. Morbidity studies in the United States indicate that the incidence of cancer in the breast is higher than that for any other single site in either sex. In women the breast is the number one site of cancer, the most frequent organ to be attacked by this malign and monstrously destructive disease. Between five and six per cent of all women—more than one in 20—is destined to develop breast cancer, and the risk of this possibility increases steadily with each decade of life (fig. 1). Breast cancer is the leading cause of death from malignancy for women between 40 and 60 years of age. This disease has a long and painful history, a dire present, and, thus far, a devastating future.

History Taking

I shall discuss briefly four topics pertaining to the practical problems of breast cancer and its clinical management. The first is history taking.

The differential diagnosis of a lump in the breast often depends upon a detailed medical history and a careful physical examination sup-

Presented before the Baltimore City Medical Society, October 1, 1965.

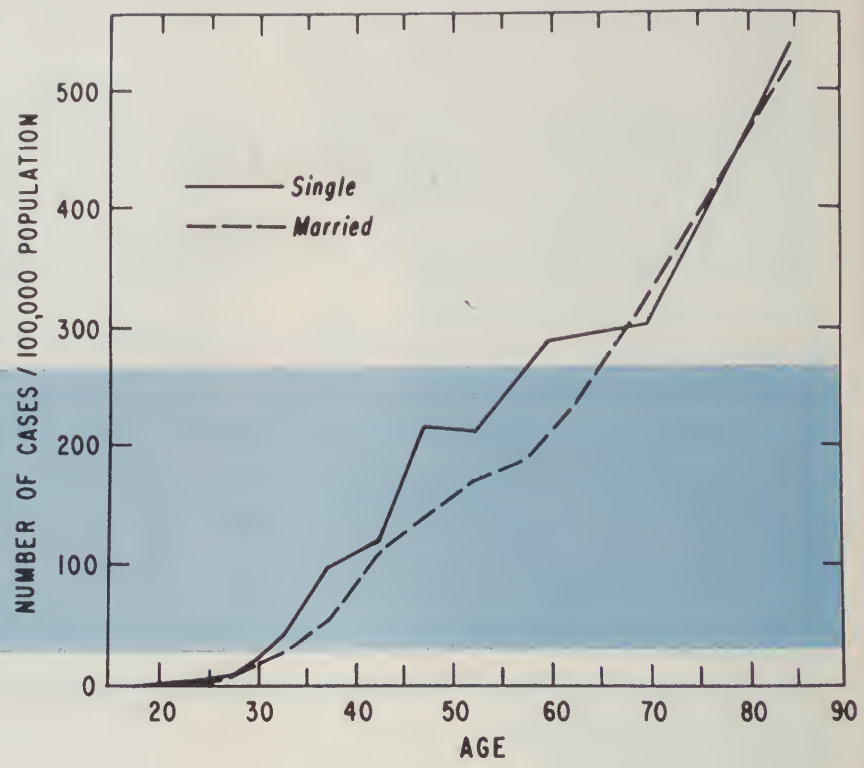

Fig 1
Breast cancer incidence rates, by marital status. Incidence is ever-increasing with each decade of life. Single women have a higher incidence of breast cancer than married women.

plemented by meaningful diagnostic instrumentation. Since the classic and cardinal concept of breast cancer and its successful treatment is based upon early diagnosis and early treatment, time is of the utmost importance. Although early breast cancer is not necessarily measured in minutes or months, but rather in malignancy and metastases, there can be little doubt that breast cancer is more curable when the diagnosis is early, the lesion local, the growth rate low, and the host resistance high.

In taking a detailed family history, past history, and present illness, one often finds a rich reservoir of medical information. There are antecedent factors of striking significance, such as a strong family history of cancer in certain kindred or family groups. The marital-pregnancy status of patients is important in view of the known increased prevalence of breast cancer in women who have never married or have never borne or breast-fed children (fig. 1).

Today, history taking must include a careful inquiry into the use of newer drugs, cosmetic preparations, and certain oral contraceptives. Within the past few years a convincing array of medical articles have pointed to the phenothiazine derivatives, tranquilizers which are in such common use, as the major cause of spontaneous and unexplained nipple secretion. Cosmetics containing hormones are usually costly creams which embody estrogens and are liberally anointed as a nocturnal ritual by many of our ageless females in their quest to remain "a thing of beauty and a joy forever." However, these hormones may cause mastodynia, breast engorgement, and aggravation of chronic cystic mastitis. Both cortisone and digitalis have been reported to have a growth stimulating potential upon both the male and female breast. Digitalis has several estrogen-like activities,[10] including cornification of the vaginal epithelium in postmenopausal women. Oral contraceptives contain a hormone combination of progestogens and estrogens. These cause breast pain, engorgement, and an increase in nodularity in some, but not all, patients with benign breast disease. The oral contraceptives are certainly contraindicated in women who have been operated upon for cancer of one breast, and I would hesitate to recommend them in other high risk population groups where the danger of breast cancer is increased.

Among our modern medical miracles there appears to be a passion for panaceas which permanently perpetuate youth. Although I have heard

it said with sadness that "wrinkles are the furrows wherein women bury their illusions," I am gravely concerned about this growing tendency toward medicinal rejuvenation. The indiscriminate use of estroegns from the "womb to the tomb" may be a serious source of danger. These growth stimulants are not necessarily the elixir of life; if taken over a long period of time, they may cause harmful changes, particularly in the breast and female organs. Randall[12] has noted a significantly lower incidence of deaths from malignant diseases among women whose preclimacteric menorrhagia was managed by the removal of the estrogenic influence by oophorectomy—a decrease in the estrogenic environment. I, for one, am not convinced that hormones are an unmixed blessing and that this "fountain of youth" is required for the salvation of all postmenopausal women in their "rendezvous with destiny."

Mondor's disease is a superficial thrombophlebitis of the veins of the breast. Once an uncommon and little known clinical entity, it is being recognized more often because it is easily confused with breast cancer.[4] Its cause is unknown, but it is frequently associated with a history of either severe or trifling breast trauma. If the dictates of the House of Dior prevail in popularizing the plunging neckline with the heavily underwired bra, the menace of the "merry widow" and the wired bra as a unique cause of Mondor's disease may become a malady of major magnitude.

Mammography

The second subject of practical importance in the clinical management of breast cancer concerns the mirage or millenium of mammary diagnosis by mammography. The widespread and exaggerated interest in this method of x-ray diagnosis has been propagated by a few enthusiasts with extravagant and persuasive claims. Although mammography is at best a gross diagnostic procedure, its merit lies in its new and objective approach to the difficult problem of differential diagnosis by clinical examination alone.

The precept that periodic examination—and by this I mean breast self-examination by the patient and regular physical examination by a physician—is important in the early detection of breast cancer must be considered imperative for the public but imperfect for the patient. Like many maxims, this one is tempting in theory but thorny in practice. The diagnosis of breast cancer at the earliest possible time leaves something to be desired, even if examination is carefully carried out by an experienced physician with a high index of suspicion. Thus, there is a favorable opportunity for mammography—a hope in diagnosis which "springs eternal in the human breast."

Recently a newspaper notice appeared which read, "The volunteer fire department will blow the siren 15 minutes before the start of each fire." While awaiting the prospect of such a prophetic siren, either for firefighting or cancer-fighting, I have great expectations that the technique and precision of mammography soon will be improved to the point where it will help us detect small and silent breast cancers before they cast their shadows beyond us. We must make use of every available means to discover today what would be all too obvious tomorrow!

I am personally grateful to the special interest of my coworker and very good friend, Dr. Hugh Morrish, of the Radiology Department of the Johns Hopkins Hospital, for the opportunity of correlating and comparing our respective accuracy rates in the diagnosis of difficult breast diseases. This small series comprised only those women with difficult and deceptive diagnostic problems and excluded the run-of-the-clinic patient with a readily recognizable fibroadenoma, cyst, or obvious cancer.

The diagnostic accuracy of clinical examination alone (by a specialist) was compared with the diagnostic accuracy of mammography plus clinical examination (by a non-specialist). The results revealed a high degree of diagnostic accuracy by both methods.

In this particular series, I cannot say that the addition of mammography modified to any major extent my surgical management of these patients or the ultimate biopsy of their breast lesions. In my own opinion mammography will find its place as an important diagnostic adjunct, particularly in those high risk patients who have been operated upon for cancer of one breast (survey of the opposite breast after mastectomy), patients with a strong family history of cancer, women with multiple recurrent benign breast tumors, and in certain cases when it is expedient and prudent to "beware of the ample bosom."

I have had no personal experience with thermography. The premature publicity and extravagant claims which have appeared in the lay press have seriously impaired the reputation of the procedure. This ill-advised notoriety has caused a great deal of embarrassment and concern to clinicians whose patients are clamoring for the miracle of this nonexistent divining rod. It is difficult to persuade some patients that thermography is not yet generally available nor is it likely to be the "cure-of-the-month."

Mammography, on the other hand, has excellent prospects for more accurate definition by improved instrumentation. This intriguing image is not infallible but will find an increasingly important place in our diagnostic armamentarium as an adjunct to physical examination. Until then, however, we must continue to place our faith in surgical biopsy and accept the shadow for the substance with considerable restraint and reservation. In a recent editorial in the *American Journal of Radiology,* McDonald and Thomas[8] state, "There are still many breast cancers, some of which are easily palpable and clinically evident, that cannot be diagnosed by mammographic examination on present criteria."

Castration

The third topic of timely importance in the total treatment of breast cancer is that of prophylactic versus therapeutic castration. In premenopausal patients with primary breast cancer, is it wise to perform "prophylactic" castration at the time of mastectomy, or is it wiser to postpone this procedure for a later time when you may need it most? This is indeed the doctor's dilemma!

It is obvious that ovarian hormones have a profound effect upon the natural history of some hormone-sensitive breast cancers. A comprehensive review[7] of the medical literature reveals that about 25-35% of premenopausal patients benefit from therapeutic castration. This palliative benefit is unpredictable and time-limited. The wide range of difference in reported results depends to some extent upon the personal optimism of each investigator (there is a natural, built-in bias in all of us which inclines us toward labeling some geese as swans).

Therapeutic castration may greatly reduce estrogen excretion in premenopausal patients, but this is not always associated with an objective or subjective clinical remission. Conversely, clinical improvement may occur with only a minimal change in measurable estrogen levels. There are no prophets of prognosis to foretell which patients will respond to therapeutic castration and which patients will not. The caprice of this response is unpredictable—easy to see, but hard to foresee.

In the dogma of cancer education there is the proverbial dictum that delay breeds danger. Therefore, prophylactic castration done as an ancillary procedure at the time of mastectomy should instinctively enhance the survival time and increase the survival rate. A controlled clinical trial of prophylactic castration (by means of radiation) in patients selected at random was started some years ago in England by Paterson and Russel. The results have recently been reported by Cole.[1] The trend in survival rates favors an artificial menopause at the time of initial breast surgery, but the figures fall short of statistical significance. On the other hand, the cooperative clinical trial of the Surgical Adjuvant Breast Project of the National Cancer Institute, U. S. Public Health Service, has observed a rigidly controlled, random series of patients castrated by means of surgical oophorectomy. In this study group, followed thus far over a one- to four-year period, the preliminary results indicate NO significant trend in the recurrence rate between women receiving prophylactic castration and the control group of women who were not castrated at the time of radical mastectomy.

The decision in this dilemma of therapeutic versus prophylactic castration is difficult. No prudent person would venture to be dogmatic regarding the best treatment policy with the evidence presently available.

Yet, "When desperate ills demand a cure, distrust is cowardice and prudence folly" (Johnson). Decisions must be made daily and treatment cannot be dissipated by delay. I would recommend that prophylactic castration be used only in those premenopausal patients having an advanced stage II breast cancer at the time of radical mastectomy. In prognosis the "iceberg effect" of numerous axillary node metastases strongly suggests the possibility of more widespread subliminal cancer dissemination even though it is not clinically discernible. This is, in effect, therapeutic castra-

FIVE YEAR SURVIVAL RATE FOR BREAST CANCER TREATED AT THE JOHNS HOPKINS HOSPITAL BY THE HALSTED RADICAL MASTECTOMY

STAGE	1935-40	1941-45	1946-50	1951-56
LOCALIZED	64%	71%	66%	84%
REGIONAL	32%	34%	41%	42%
TOTAL	44%	46%	52%	62%

Fig 2
Five-year survival rate (crude) showing improvement in results over sequential time periods.

tion at an early time. With careful clinical consideration of the emotional stability and psychologic status of the patient, I would favor oophorectomy for those women with stage II disease under 40 and radiation castration for those women over 40, as well as for those postmenopausal women having a high estrogenic index on the vaginal cytogram. *For all other patients I would reserve castration for therapeutic purposes.* However, I would carefully caution all premenopausal patients to avoid pregnancy for a three-year period after mastectomy, and I would warn them against the use of oral contraceptives which contain estrogens.

The pleasant irony of Joseph Hilaire Pierre Belloc may be paraphrased to sum up our current confusion and concepts concerning castration in the treatment of breast cancer:

The Doctors, who ought to know,
Assure us that this might be so . . .
Oh! let us never, never doubt
What nobody is sure about.

Treatment

The fourth facet of this subject concerns the continuing controversy over the best surgical treatment of breast cancer. There are fierce personal passions which are "strongly prejudiced in favor of whatever is countenanced by antiquity, enforced by authority, and recommended by custom." Thus, although radical mastectomy has been our rampart of preservation for more than 70 years, there are equally strong convictions in favor of simple mastectomy on the one hand and super-radical or extended radical mastectomy on the other. It is quite obvious that although the routine Halsted radical mastectomy is still regarded as our treatment of choice in operable breast cancer, the omnipotence of this procedure over simple mastectomy (with or without radiotherapy) or super-radical mastectomy remains to be decisively demonstrated. Statistical proof of this superiority is still entirely lacking.

There is no doubt, of course, that earlier diagnosis and earlier treatment tend to increase the survival span in breast cancer merely by beginning the count-down at an earlier time. Thus, as long as cancer education, breast self-examination, and cancer detection continue to result in earlier and still earlier diagnosis, then that study which reports the most recent series usually will show the best survival rate (fig. 2). This may account for the paradox of breast cancer whereby the more recent survival rates show improvement over successive and sequential time periods despite the uniform and level trend of national and international mortality rates. The number of breast cancer deaths per 100,000 women has not declined in this country during the past 30 years. Although there may be varying trends in each age group[6] the total age-adjusted mortality from breast cancer (in females) in the United States was 23.8 per 100,000 population in 1930 and 24.3 per 100,000 population in 1959-61.

A careful and critical review of recent 10-year survival rates, instead of five-year survival rates, may give us a more reliable index with which to compare the effectiveness of various treatment

SURVIVAL RATES FOR RADICAL MASTECTOMY BY EXTENT OF DISEASE

Treatment	Negative Nodes			Positive Nodes			Unknown			Total	
	No.Pts.	Survival %		No.Pts.	Survival %		No.Pts.	Survival %			
		5 yrs	10 yrs		5 yrs	10 yrs		5 yrs	10yrs	5 yrs	10 yrs.
Radical Mastectomy	177	84	64	192	42	30	1	100	100	62.3	48.7

Fig 3

Crude five- and 10-year survival rate for breast cancer treated by radical mastectomy at the Johns Hopkins Hospital.

methods. Kaae and Johansen[5] have reported the results of two random and comparable series, including all new cases of breast cancer admitted to the Radium Center in Copenhagen since 1951. One group was treated by simple mastectomy and postoperative radiotherapy; the other group was treated by extended radical mastectomy. The comparative crude 10-year survival rates were 44% and 42%, respectively. Despite these widely differing treatment techniques, the 10-year results were almost identical.

The most recent report of McWhirter[9] from the Royal Infirmary of Edinburgh indicates a crude 10-year survival rate of 46% for 1,429 operable patients treated by a simple mastectomy and x-ray therapy. During this same period, the relative 10-year survival rate for radical mastectomy at the well-known M. D. Anderson Hospital[2] was 46.9%, and at the Johns Hopkins Hospital, the most recent (1951-56) crude 10-year survival rate for radical mastectomy was 48.7% (fig. 3). Devitt and Beattie[3] have recently reported the results of treatment of breast cancer at Civic Hospital Division, Ottawa Clinic of the Ontario Cancer Foundation in Canada between 1946 and 1957. The crude 10-year survival rate for radical surgery was 41% and for conservative surgery 38%. Conservative and radical surgery seemed to be equally effective when the crude survival rates and local recurrences are considered.

Thus, "though all things differ, all agree." There certainly seems to be a striking similarity and surprising uniformity of survival rates in most comparable series regardless of type of treatment or method of mastectomy. In celebrating our therapeutic triumphs are we merely measuring those "curable" cancers which grow locally or grow slowly without early spread of distant metastases? Whereas the five-year survival rates are generally similar, the 10-year survival rates are surprisingly uniform and almost identical when the extent of disease is comparable.

It is quite obvious that further comparisons between individual series of patients differing in time of treatment, case selection, and extent of disease will never resolve our basic differences of clinical opinion. The most effective method of evaluating different methods of treatment is by the organization of a large scale clinical trial. We owe a debt of gratitude to our British colleagues for their pioneer efforts in initiating these suitable studies. A carefully controlled clinical trial is currently underway in southeast Scotland. Participation is in accord with a very precise protocol, and patients are randomly allocated for 1) radical mastectomy or 2) simple mastectomy and radiotherapy. Ultimately these results should permit a valid comparison between two vastly different treatment methods for operable breast cancer.

In the design of a clinical trial there must be no conflict of moral or ethical conduct on either side of the study. If the consensus of existing knowledge indicates that the methods of treatment that are being clinically compared are *equivalent,* then our professional ethics are justifiable and the therapeutic trial morally proper.

There is an urgent need for a large and carefully controlled clinical trial to compare the effects and results of alternative methods of treatment for breast cancer. The protocol of this clinical trial should include comparisons between

radical mastectomy, simple mastectomy, super radical mastectomy, as well as such adjuncts as castration therapy, radiotherapy, and chemotherapy. Only by a carefully designed clinical trial of this kind can we determine the best treatment policy for each patient. In this critical matter we can no longer afford to be "sheep in credulity, but wolves for conformity."

Clinical opinion varies widely as to the best treatment policy for each patient, ranging from total surgical nihilism to the heroic efforts of super-radical surgery including supraclavicular dissection and simple mastectomy on the contralateral side. While recognizing the need for orthodoxy in our accepted practice, we must be receptive to the proposals of surgical heterodoxy. The wisdom of St. Paul combines progress with tradition —prove all things and hold fast that which is good.

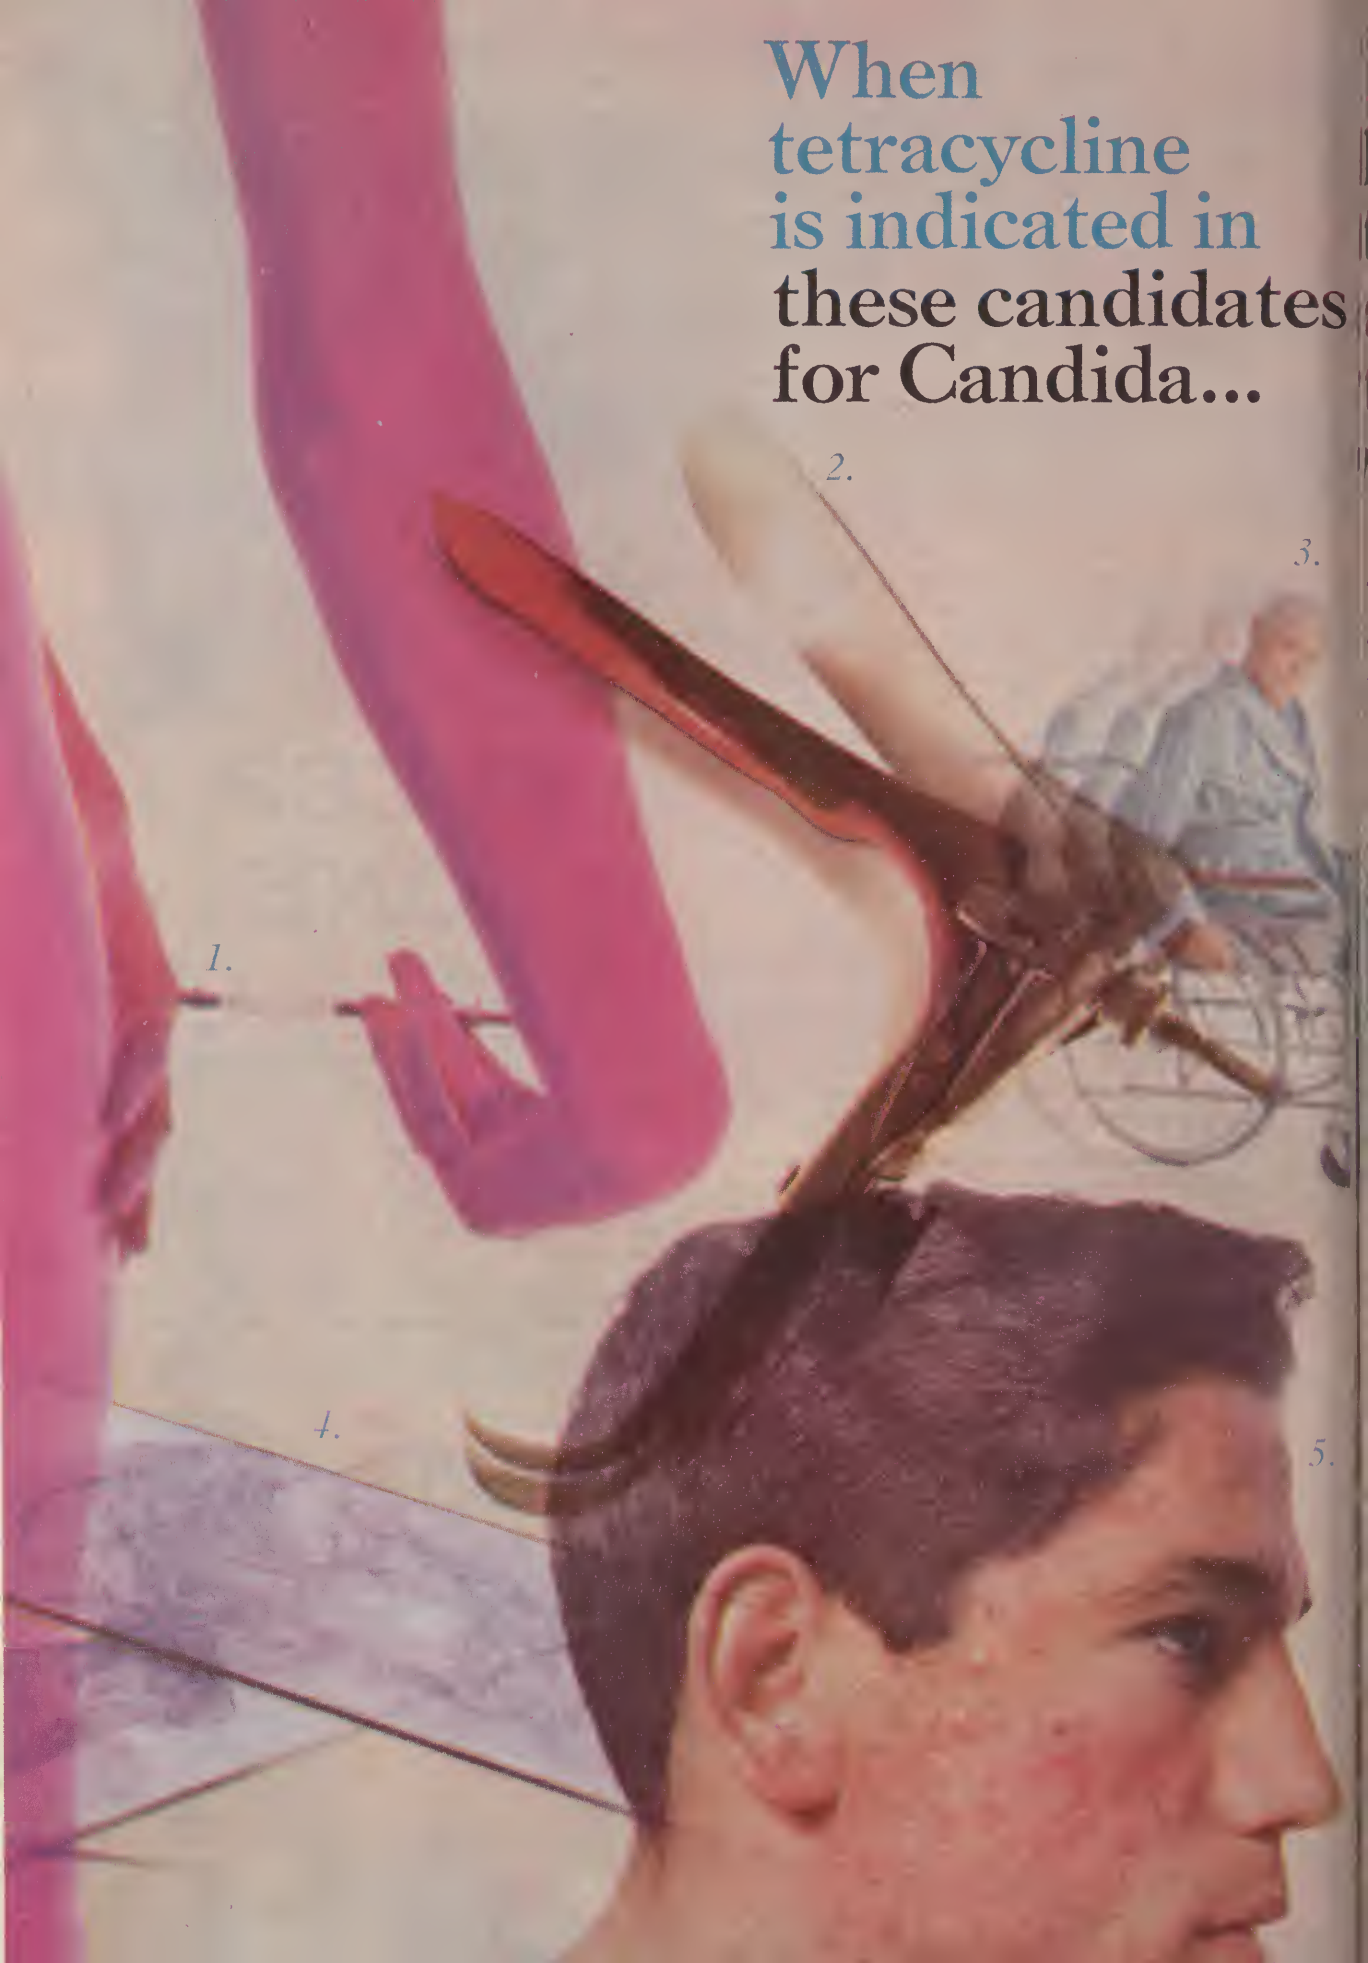
SLEEP ZONE

To turn a hospital zone into a sleep zone, you need more than peace and quiet. Your patients need a mattress which gives the right kind of firm, comfortable support. To hospitals across the country, this means the Serta Perfect Sleeper "Hospital" mattress.



It provides restful, healthful sleep, because the patient sleeps on it, not in it. And just as important to you, the Serta Perfect Sleeper retains its firmness for years and years of service.

Interested? There's a Serta contract bedding expert near you. Let him help you choose from the comprehensive range of specifications on Serta quality bedding.

New low-cost tetracycline/ antifungal therapy

Tetrex®-F

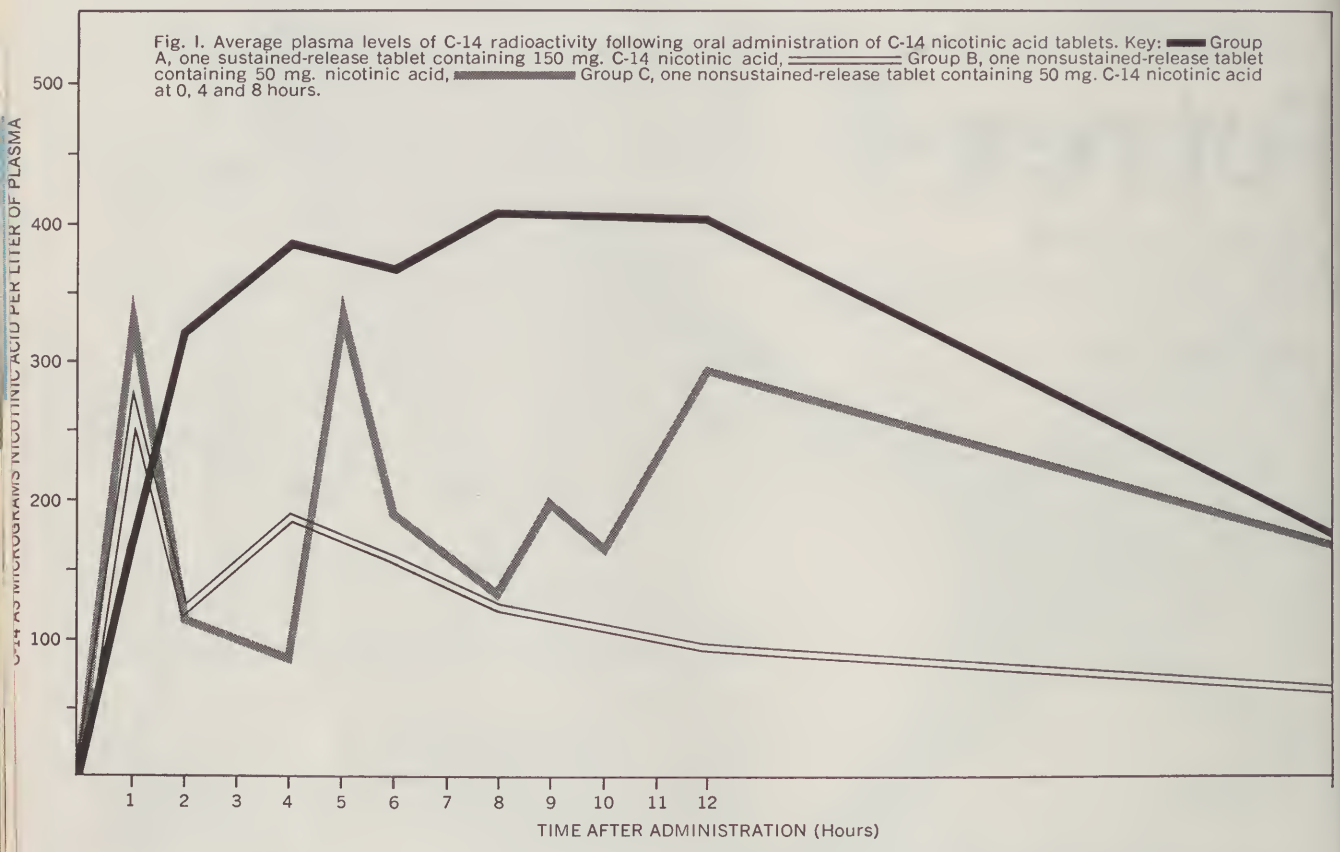
tetracycline phosphate complex -nystatin

Because new Tetrex-F (tetracycline phosphate complex-nystatin) is the most economical therapy of its kind that you can prescribe, it is a sound choice whenever tetracycline therapy is indicated in patients predisposed to monilial infections.

Who are these "candidates for Candida"?

1. diabetic patients
2. nonpregnant women with a history of recent or recurrent monilial vaginitis
3. elderly or debilitated patients
4. patients with a past history of moniliasis
5. patients on long-term tetracycline or corticosteroid therapy.

For these patients, Tetrex-F (tetracycline phosphate complex-nystatin) provides efficient tetracycline therapy against a broad range of infections *plus* protection against superinfection associated with the overgrowth of *C. albicans* in the G.I. tract.



Priced for savings

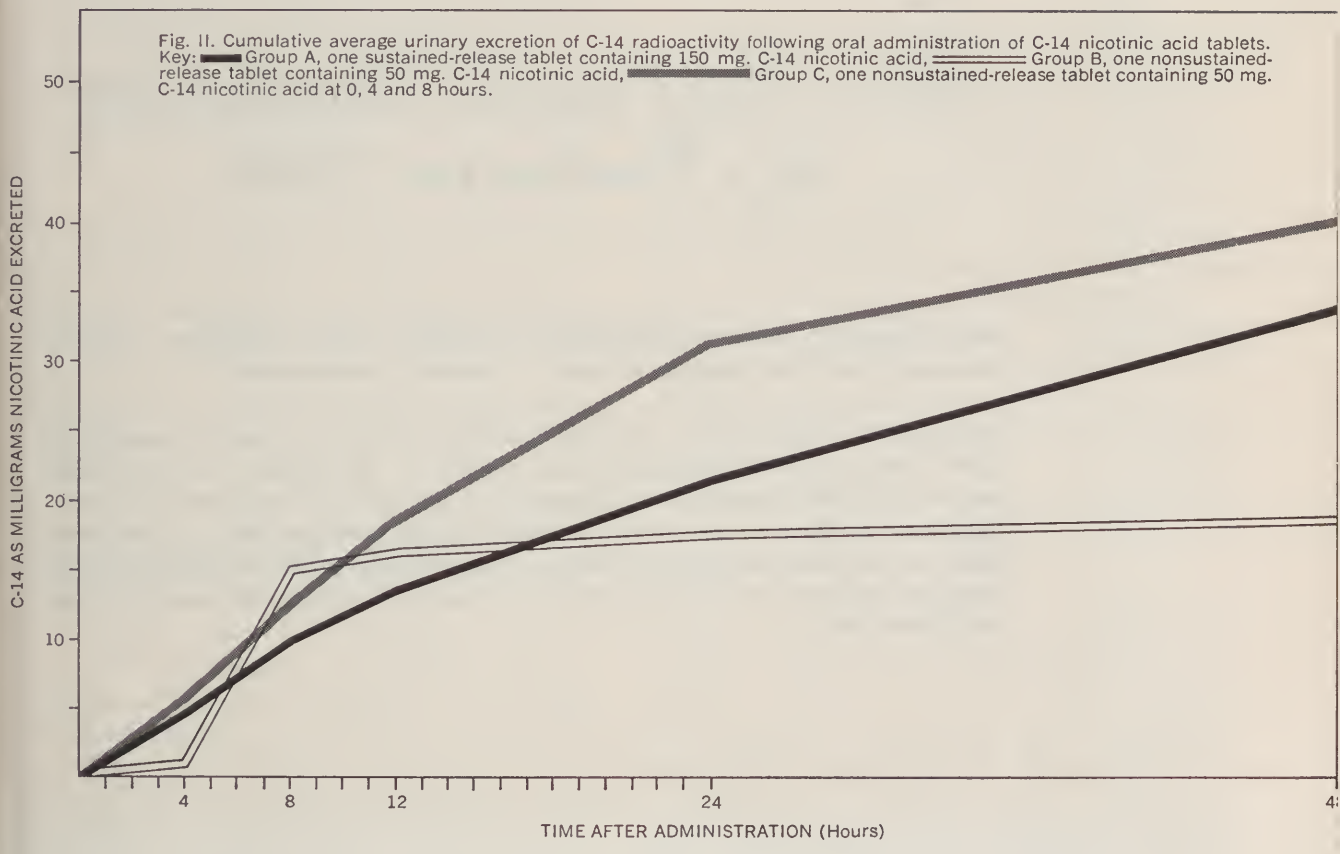
Tetrex-F (tetracycline phosphate complex-nystatin) is lowest in cost—priced 20% lower than most tetracycline/antifungal products.

BRISTOL THERAPEUTIC SUMMARY
For complete information consult Official Package Circular.
Indications: Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms, in patients with increased susceptibility to monilial infections.
Contraindications: The drug is contraindicated in patients hypersensitive to its components.
Warnings: Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. No cases of photosensitivity have been reported with Tetrex (tetracycline phosphate complex). With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood).
Precautions: Bacterial superinfection may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months.
Adverse Reactions: Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis, and allergic reactions may occur.
Usual Adult Dosage: 1 capsule q.i.d. Continue therapy for 10 days in beta-hemolytic streptococcal infections. Administer one hour before or 2 hours after meals.
Supply: Capsules, bottles of 16. Each capsule contains tetracycline phosphate complex equivalent to 250 mg. tetracycline HCl activity and 250,000 units of nystatin. Oral Suspension, 60-ml. bottle. Each 5 ml. contains tetracycline equivalent to 125 mg. tetracycline hydrochloride and nystatin, 125,000 units.

BRISTOL
BRISTOL LABORATORIES
Division of Bristol-Myers Co.
Syracuse, New York

Sustained circulatory, respiratory and cerebral stimulation for the

(fewer absent doses by absent-minded patients)



Human volunteer subjects were administered Geroniazol TT tablets with the nicotinic acid component made radioactive with C-14. Plasma and urine samples were analyzed. (See Figures I and II) The radioactive tracer study substantiated the previous clinical evidence that the release of nicotinic acid from the Geroniazol TT tablet produced a gradual rise in plasma levels to a plateau for a total of 12 hours and more.

Such proven sustained activity makes the management of geriatric patients much easier by minimizing the possibility of neglected doses through absent-mindedness or senile confusion. Therapy *can* be continuous on a daily dose of only one Geroniazol TT tablet every 12 hours.

The gradual release of nicotinic acid in Geroniazol TT will provide the well-known peripheral vasodilatation needed in patients with deficient circulation and with a minimum amount (if any) of "flushing." Also, cerebrovascular circulation is complemented by pentylenetetrazol, long-established as a cerebral and respiratory stimulant.

Geroniazol TT improves the typical, unfortunate, signs of senile confusion. Patients become more alert,

;ged and debilitated

less confused and moody. Personal care, memory, emotional stability, social attention improve. Fatigue, apathy and irritability are reduced.

A prescription for 100 tablets of Geroniazol TT will permit your patients to enjoy the benefits of time-prolonged nicotinic acid/pentylenetetrazol therapy, at an economical price. Dosage is only one tablet every 12 hours.

Contraindications: There are no known contraindications.

Precautions: Exercise caution when treating patients with a low convulsive threshold.

Side Effects: Side effects are rarely encountered, however due to the vasodilatation effect of nicotinic acid, transitory mild nausea, flushing, tingling and pruritus are possible.

Dosage: One tablet every 12 hours.

Supplied: Prescribe bottles of 100 tablets, to take advantage of recent price reduction.

Use of the Physical Examination in a Psychiatric Clinic

What happens when an outpatient psychiatric clinic establishes a policy requiring each new patient to have a physical examination?

The Mental Health Study Center, in Prince George's County, instituted such a policy and then investigated its effects on the patients, on the clinic, and on the physicians in the community. The clinic found that the new requirement did not deter patients seeking help, that the delay in rendering clinic services was slight, that 45% of the examinations revealed positive findings, and that it created better communication with the physicians in the community.

FORTUNE V. MANNINO, PhD
HAROLD W. WYLIE, JR., MD

The Mental Health Study Center, a branch of the National Institute of Mental Health, was established in Prince George's County, Maryland, in 1948 as a mental health clinic. One of its major functions has been the operation of a psychiatric outpatient unit, which has served the residents of Prince George's County for 15 years. While continuing to maintain its clinical functions, the Center has in more recent years placed increasing emphasis upon research and demonstration activities.

Several years ago the professional staff became concerned that in many instances there was little or no knowledge about the physical status of patients who were referred to us by various professional persons in the county. Since we believe knowledge of a patient's physical condition to be a necessary part of a full and complete psychiatric evaluation, we decided to include a physical examination as a routine part of clinic admission procedure. The director of the Study Center, along with other physician members of the staff, designed a brief physical examination form to be completed for all patients accepted by the Study Center for psychiatric service.

The following procedure was established:

From the Mental Health Study Center, Adelphi, Md.

When a patient, having already been accepted for service through referral from a professional source in the county, calls the Study Center to discuss arrangements for his initial appointment, he is told of the necessity for a physical examination. He is told that the form will be sent to him, along with a letter addressed to the physician explaining the necessity of the examination, and a self-addressed, stamped envelope. The form is to be taken to the patient's physician of choice, completed, and returned to the Center, whereupon the clinic's receptionist contacts the patient for his first appointment.

This basic procedure has continued unchanged since its adoption. Exceptions to its use are rare. It has been waived for emergencies, for brief psychiatric examinations as part of consultation, and occasionally when the referring source is a physician or medical agency which already is familiar with the patient's physical condition. Few patients have objected to having the examination. In general, we have found the policy to operate efficiently.

This does not mean that we did not have certain questions which we wondered about, in spite of the apparent efficiency with which the procedure worked. Four particular areas concerned us, which we decided to investigate:

1. The first had to do with the effect of the physical examination requirement on our patients. Did some patients tend to regard it as an obstacle, ie, one additional hurdle to overcome before receiving help? If so, did many patients who might otherwise have availed themselves of our services fail to do so because of this requirement?

2. The second question was whether or not the physical examination further delayed the patient in receiving clinic services. Since we had no idea of the time interval between a patient's call to us and the return of the completed examination form, we did not know to what extent the requirement caused a delay in the services offered.

3. Next, we were curious as to how often physical examinations revealed other than negative findings on our patients. Negative findings in and of themselves are of sufficient value to warrant their use, but we also wanted to know how often clinically significant findings came to light.

4. Finally, we wondered how the physicians in the community reacted to the physical examination form. We had hoped that the form would inform them about the Study Center as a medically-oriented psychiatric agency and would provide the Center staff with an opportunity to communicate with the physicians about specific situations whenever appropriate; however, the extent to which this actually occurred was not known.

Method

To answer these questions, several related investigations were undertaken. First, to explore questions 1 and 2, we compared a group of patients which had not been exposed to the physical examination requirement with a group which had been so exposed. The first group comprised all patients who had been accepted for service during the 21-month period immediately prior to instituting the physical examination requirement, and the second group comprised those patients accepted during the 21-month period after institution of the new policy.

To find out how often information useful to the psychiatric staff was obtained from completed physical examinations (question 3), all completed examinations obtained during the 21-month period after the requirement was established were reviewed by a staff psychiatrist.

Finally, to learn whether this arrangement of obtaining physical examinations stimulated or increased contacts or perhaps reduced contacts between the Study Center staff and the community physicians, we checked the names of all physicians who returned completed physical examination forms to us with the names of physicians who had previously used the Center to request referrals or consultations. The primary intent here was to determine the number of physicians who began to contact the Center, ie, called about referrals or consultations,* after they had performed one or more physical examinations on our patients, and the number who either increased or decreased their use of the Center in this manner after having completed one or more physical examinations.

Findings

We found, first, that the physical examination

*Consultation as used here refers not to the customary practice of a physician reviewing and examining a patient for a fellow physician and then making specific recommendations, but rather to the much broader practice of discussing psychiatric issues as they may pertain to medical practice or a particular patient problem.

requirement did not increase the number of patient admission failures. The difference in the percentage of patients who called for service and then failed to follow through, before and after the physical examination requirement was placed in effect, was insignificant (17% before and 19% after). Hence, it appeared that patients did not view the requirement as an obstacle to help.

Second, we found that the average length of time which it took for patients to receive the physical examination form from us, have the examination completed, and the form returned was slightly less than two weeks. This surprised us; we had somehow believed that it took considerably longer to accomplish this procedure. Therefore, the physical examination requirement itself did not cause an unreasonable delay in the receipt of clinical services from the Center.

To our third question, a review of 99 completed physical examinations showed that 45% reported physical or historical findings with clinical significance. The study included only those findings of physical problems which could affect the clinical course of the patient as revealed by a report of physical abnormalities and/or report of diagnostic studies or medical treatment. For example, knowledge of physical abnormalities such as a femoral hernia, an enlarged thyroid, or active cervicitis was considered important to the professional staff. Similarly, descriptions of previous diagnostic studies, such as a bronchoscopy or an upper gastrointestinal series, and the history of previous medical and/or surgical treatment, such as a treated duodenal ulcer or a bilateral oophorectomy, were held to be of clinical significance.

This finding would appear to attest to the importance with which local physicians viewed the physical examination, as well as to the thoroughness of their work. Considering this along with the relatively short time in which patients completed the examination, one is impressed by the spirit of cooperation demonstrated by the physicians.

Finally, upon reviewing all physical examinations completed during the first 21 months of the new policy, we found that 69 physicians in the metropolitan Washington area had completed examinations on our patients. Of these, 34 had not had prior contact with the Center, while 35 did have previous contacts with the Center concerning consultation and/or referrals. Of those who had had no prior contact, 12 subsequently instituted one or more contacts concerning referrals or consultation. Of the physicians who had previous contacts with the Center, seven began contacting the Center more frequently after submitting one or more physical examination forms. Contacts by the remainder of this group continued with no noticeable change except in two cases in which the frequency of contact appeared to decrease. Therefore, of the total 69 cooperating physicians, 19, or 28%, either initiated or increased their contact with the Center after establishment of the physical examination requirement.

Conclusions

The experience at the Mental Health Study Center has shown that the physical examination requirement has not had an adverse effect on the patients applying for clinic services but has provided a method for better communication between the Center and the medical community. Although the examination requirement caused some delay in the patient's receipt of clinic service, this delay was relatively slight when compared with other factors which usually enter into the patient's waiting period. Moreover, in spite of this delay, there was no evidence to suggest that the physical examination requirement was an obstacle between the patient and the Center.

The policy requiring physical examination created a liaison between the mental health clinic and the physicians in the community. The importance of this liaison cannot be overstressed, since it acts to the mutual benefit of the clinic, the physician, and the patient. For the clinic, an opportunity to confer with the physician, who in many instances has a long acquaintance with the patient and his family, can provide valuable information and give us a better understanding of the patient's problem. The physician, who often maintains care of the patient during and after his clinic contact, gains an added understanding of the emotional implications of the patient's medical problem. Finally, the patient receives the benefit of cooperative medical care through receiving psychiatric treatment from a professional who is alert to his physical problems and through being cared for by a physician who is attuned to the emotional implications of his medical problems.

nidar®

Sleep comes easy...lingers...departs naturally

Gentle doses of 4 barbiturates assure uninterrupted sleep

2 barbiturates act fast...in 20 to 30 minutes

2 long-range barbiturates come into play to sustain sleep for up to 8 hours

Tiny amounts of individual barbiturates means Nidar is well tolerated

Patients enjoy a refreshing, clear-headed wake-up

makes sleep irresistible

IN BRIEF:

EACH TABLET CONTAINS:

Pentobarbital Sodium	25 mg.
Secobarbital Sodium	25 mg.
Butabarbital Sodium	7.5 mg.
Phenobarbital	7.5 mg.

(WARNING: MAY BE HABIT FORMING)

Dosage: One or two tablets, one-half hour before bedtime.

Indications: For night-time sedation and refreshing sleep up to eight hours.

Contraindications: Patients sensitive to barbiturates. Use with caution in the presence of moderate to severe hepatic disease.

Supplied: Bottles of 100 tablets.

CAUTION: Federal law prohibits dispensing without a prescription.

Chicago, Illinois, U.S.A.

Massive Doses of Ethamivan in Severe Phenobarbital and Tranquilizer Intoxication

A. A. SILVER, MD

Ethamivan (vanillic acid diethylamide), a relatively new respiratory analeptic agent, has been reported to be useful in the treatment of respiratory insufficiency[1-9] in chronic or acute respiratory disease and in combatting central and respiratory depression from excessive barbiturate administration.[9-15]

It is a restorative agent with a prime site of action at the medullary center, effecting respiratory stimulation and arousal. Secondary influences have been demonstrated by the restoration of heart rate and blood pressure to predepressed levels. In a dose-related manner, stimulation of the brain stem can ascend to reach cortical levels and produce generalized cortical excitation. By monitoring dose and rate of administration, selective respiratory stimulation may be activated, stimulated, and maintained in centrally depressed states.

Toxicity of sedative, narcotic, and hypnotic drugs is directly related to the degree of respiratory insufficiency or failure ultimately resulting in terminal vasomotor collapse, asphyxia, and death. Intensive efforts, in the absence of specific pharmacologic antagonists to the barbiturates, are directed toward maintaining adequate renal function. This report describes the management of a patient severely intoxicated with barbiturates solely by continued administration of the respiratory analeptic ethamivan. Once a patent airway was assured, this agent satisfactorily controlled respiratory activity, circulatory dynamics, and renal output.

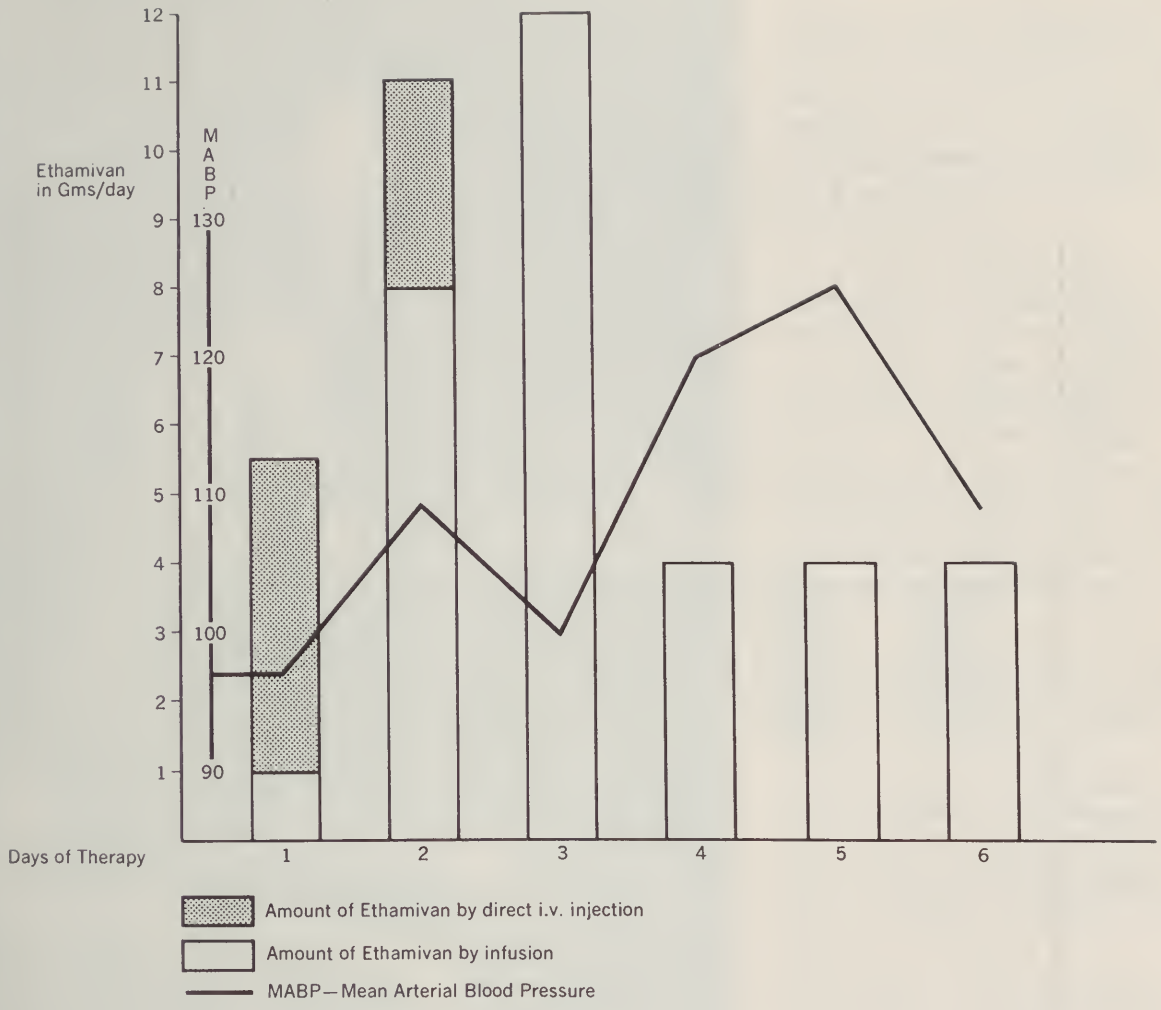
CASE REPORT

A 65-year-old diabetic, white man was admitted to the Sinai Hospital on August 17, 1963. He had been unconscious for about 14 hours before admission. Three hours before admission, his business associate had found him in his office, unconscious, lying beside his desk. He had him removed to a nearby hospital emergency room, where the diagnosis of cerebrovascular accident had been proposed. The attending house officer

This is a case of a diabetic man with severe phenobarbital and meprobamate intoxication. Respiration was successfully maintained during six days of unconsciousness with massive intravenous doses of ethamivan. A total of 40.5gm was administered. The only side effect noted was the appearance of bullae secondary to induration at the site of intravenous injection. Follow-up studies of renal and hepatic function showed no evidence of toxicity from either the depressant or stimulant drugs.

had received erroneous information that the patient had left his home to go to his office earlier that day.

The patient's breathing was described as shallow, and he was reported to be deeply cyanosed upon arrival at the emergency room. Blood pressure was 108/60; pulse was rapid and weak. Oxygen was delivered via nasal catheter at a rate of 4-6 liters/min for 48 hours, and an intravenous infusion of 5% dextrose in water was given. Three hours after first being seen in the emergency room, he was transferred to the Sinai Hospital. Oxygen and IV fluids were continued during the transfer.



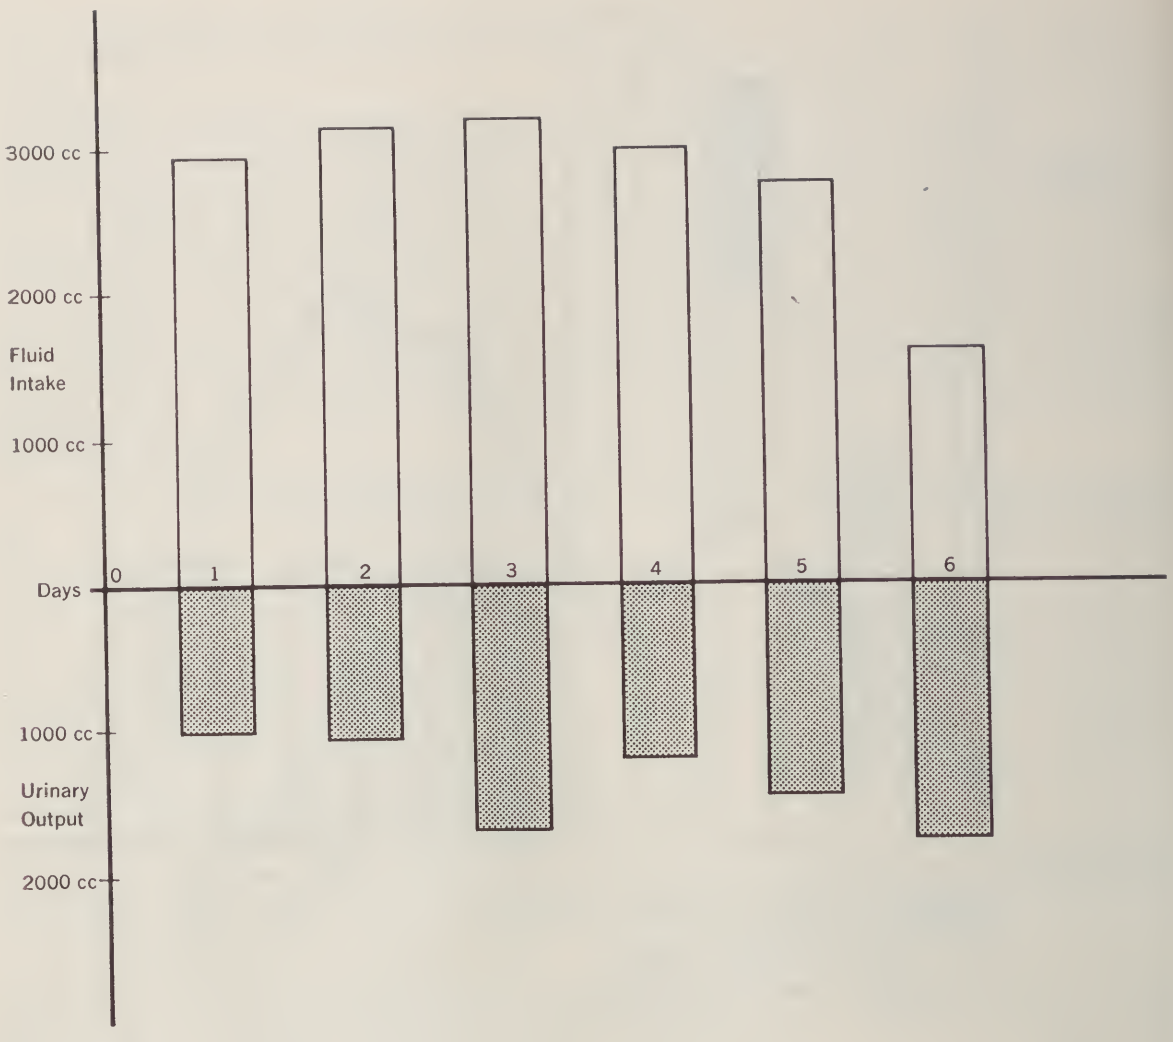
Upon arrival at the Sinai Hospital, the patient was comatose; he showed Cheyne-Stokes respirations, and the blood pressure was 110/60, falling rapidly to 80/60. There was no evidence of trauma; the DTR were depressed in all extremities; and the EKG showed left ventricular strain. He was given gastric lavage, tracheal suction, and nasal oxygen. Lumbar puncture revealed the spinal fluid to be clear and under normal pressure; chemical and microscopic examination of this fluid was normal. Hematocrit was 42.5; WBC, 12,000 with normal differential. Initial blood chemistries included: blood glucose, 210mg/100cc blood; blood urea, 32mg/100cc blood; CO_2, 26mEq/l, and electrolytes normal.

Fours hours after admission to the Sinai Hospital it was learned that the patient had left his home 13 hours before being found unconscious. This information, together with the spinal fluid findings and the clinical picture, led us to suspect barbiturate poisoning. Blood and urine were immediately obtained, and it was ascertained that the blood serum barbiturate level was 6mg/100cc blood, and the urine (by catheterization) showed a barbiturate level greater than 100mg/100cc urine, together with traces of meprobamate.

Ethamivan therapy was started immediately upon suspicion of barbiturate poisoning. On the first day of hospitalization, 5.5 gm of ethamivan was administered in the following manner: 500mg was given directly intravenously, and a continuous infusion of 5% dextrose in water was started with 1000mg of ethamivan added to 1000cc fluid, plus regular insulin to cover the dextrose. Immediately upon injection of the compound in the concentrated state (10cc ampul containing 500mg of ethamivan in 5% aqueous diethanolamine), respirations became deeper and the patient responded to pain stimulae. In the next six hours he received three doses of ethamivan by direct intravenous injection of 1000, 1500, and 1500mg each, to restore normal respirations. At this point the hospital's supply of ethamivan was depleted and approximately three hours elapsed before an additional supply was obtained. During the period without treatment, Cheyne-Stokes respiration reappeared and the patient did not respond to pain stimulae. When ethamivan was resumed, breathing again became normal and the patient again responded to pain stimulae.

On the second day of hospitalization, beginning at 1 AM, he received 11gm of ethamivan; 2000mg was given every six hours by continuous infusion in 1000cc of dextrose in water. He also received two doses of 1500mg directly IV when Cheyne-Stokes respiration reappeared. At 10 PM of the second day of hospitalization, several bullae, 1 to 2cm, appeared at the site of infusion. Temperature rose, and 500mg oxytetracycline was added to each 1000cc IV fluids every six hours for 24 hours.

On the third day the patient received an additional 12gm of ethamivan similarly administered. He began to react more to pain stimulae; he opened his eyes and became somewhat restless. On the fourth day adequate control was maintained with 4gm of ethamivan divided in doses of 2000mg each by continuous infusion with 1000cc of dextrose in water. On the fifth day he began talking incoherently; again two doses of 2000mg were given by continuous intravenous infusion. On the sixth day he was able to swallow liquids; breathing became normal, and he was maintained on the continuous IV 5% dextrose in water with 1000mg ethamivan every six hours. On the seventh day he was able to eat the full diabetic diet; IV fluids and ethamivan were discontinued. He was coherent and was able to relate the full details of his attempted suicide. He disclosed that he had taken 30 1.5 grain tablets of phenobarbital and an undetermined amount of meprobamate (more than 100, 400mg tablets, approximately 48,000mg). On the eighth day psychiatric treatment was started, and on the seventeenth day he was discharged to his home and outpatient psychiatric care.



DISCUSSION

In this case of severe barbiturate and meprobamate intoxication, the patient was first seen in coma and was managed through to complete recovery. A patent airway, supplemental oxygen administration, and ethamivan constituted the therapeutic regimen. At least in this case, the need for ancillary measures never arose. In fig 1 doses of ethamivan on a daily basis are recorded and divided into modes of administration. The duration of supplemental oxygen administration is not shown; this was administered continuously for the first and second hospital day at 4-6 liters/min via nasal catheter. Of vital significance is the level of mean arterial blood pressure and the urinary output maintained as a response solely to the administration of this respiratory stimulant and, therefore, plotted in fig 2. Observations of respiratory activity are reported in the text. Except for rate which was deemed adequate, no other monitoring of this parameter was performed; clinical estimates seemed valid and are supported by the outcome.

CONCLUSION

Ethamivan is safe and effective when given intravenously in massive doses over an extended period of time. It may be used concomitantly with glucose, insulin, tetracycline, and oxygen in the management of barbiturate and tranquilizer intoxication. One must use extreme caution to prevent extravasation of infusion material at the site of injection, since the induration which we encountered produced severe pain for several

days. Although unusually high doses of ethamivan were used to support respiration in this case, we encountered none of the side effects previously reported (sneezing, itching, muscular twitching, coughing, etc.), and its administration was continued until no longer required.

the sedentary life is often the seat of low back pain

The human spine is not engineered for prolonged sitting at desks, pianos, typewriters and drafting boards. The stresses set up by the heavy, forward-tilted head and trunk, balanced precariously on an insufficient base, result in strain of the dorsal musculature, particularly at the low lumbar level.

The unusual muscle-relaxant and analgesic properties of 'Soma' make it especially useful in the treatment of low back sprains and strains. 'Soma' is widely prescribed ☐ **to relieve pain** ☐ **to relax muscles** ☐ **to restore mobility.**

Indications: 'Soma' is useful for management of muscle spasm, pain, and stiffness in a variety of inflammatory, traumatic, and degenerative musculoskeletal conditions. It also may act to normalize motor activity in certain neurologic disturbances.

Contraindications: Allergic or idiosyncratic reactions to carisoprodol.

Precautions: 'Soma', like other central nervous system depressants, should be used with caution in patients with known propensity for taking excessive quantities of drugs and in patients with known sensitivity to compounds of similar chemical structure, e.g., meprobamate.

Side Effects: The only side effect reported with any frequency is sleepiness, usually on higher than recommended doses. An occasional patient may not tolerate carisoprodol because of an individual reaction, such as a sensation of weakness. Other rarely observed reactions have included dizziness, ataxia, tremor, agitation, irritability, headache, increase in eosinophil count, flushing of face, and gastrointestinal symptoms.

One instance each of pancytopenia and leukopenia, occurring when carisoprodol was administered with other drugs, has been reported, as has an instance of fixed drug eruption with carisoprodol and subsequent cross reaction to meprobamate. Rare allergic reactions, usually mild, have included one case each of anaphylactoid reaction with mild shock and angioneurotic edema with respiratory difficulty, both reversed with appropriate therapy. In cases of allergic or hypersensitivity reactions, carisoprodol should be discontinued and appropriate therapy initiated. Suicidal attempts may produce coma and/or mild shock and respiratory depression.

Dosage: Usual adult dose is one 350 mg. tablet three times daily and at bedtime.

Supplied: Two Strengths: 350 mg. white tablets and 250 mg. orange, two-piece capsules.

Before prescribing, consult package circular.

EATING PATTERNS OF OBESITY

A study of recorded diets of obese patients in an out-patient clinic.

IAN R. ANDERSON, MD
MERRILL I. BERMAN, MD
Co-directors, Anti-calory Clinic

The dangers and complications of obesity are almost as well known and as frequently heralded as are the dangers of excessive smoking or drinking. Obesity decreases life expectancy. Even rats of normal weight outlive those who are overweight.[1] In humans, life expectancy decreases as the degree of overweight increases.[2, 3] Because epidemic obesity appears to be related to economic stability and overabundance, the United States has been beseiged, both in the lay press and in medical journals, with diets, drugs, and combinations of each designed to reduce the more corpulent members of our society.

In this struggle for an answer to obesity and its many-faceted problems, there has been a recent upsurge of investigations into weight reducing through lower caloric intake. Other investigations have sought the reasons why an individual is and remains obese as related to his basic eating patterns. Recent work with rats has shown that when rodents are allowed to eat ad lib (as is their usual habit) they will retain their normal weight; however, when they are exposed to food for a limited number of hours a day and must consume their total daily intake during this artificial period, there is initially a weight loss followed by a rapid gain to levels above their normal weight. There appears to be a rather intriguing resultant metabolic error produced in these studies with an increase in lipogenesis during the "stuff and starve" program which, teleologically, may be interpreted as an attempt to store, during the limited eating period, sufficient calories for 24 hours by converting glucose and carbohydrates into fatty acids for more economical storage of calories for future use.[4] This apparent metabolic defect has been postulated to lie either in a rearrangement or derangement of the satiety center in the ventrolateral hypothalamus or a possible change in the enzyme systems responsible for adipose tissue deposition and fatty acid metabolism, or even in a combination of these.[5]

This work on rats has been interpolated to humans and is demonstrated by patient eating patterns. The obese person supposedly is one who often eats no breakfast or lunch and subsequently eats a rather large dinner with continual snacks after the evening meal. These people also may manifest the "night-eating syndrome" with apparent loss of satiety and associated insomia.[4]

In our clinic, we have found some data which may fail to substantiate some of the aforementioned theories and their conclusions.

METHODS

The Anti-calory Clinic was established in September, 1962. It is an out-patient clinic which is open to the citizens of Baltimore between the ages of 17 and 50 regardless of sex or socio-economic conditions. We have processed more than 100 patients thus far with gratifying results in 80%. The clinic meets weekly, and the initial testing period for weight reduction is three months. After this three-month period is completed, the patient may continue to attend the clinic if he wishes to do so. Each patient is weighed in and his actual recorded diet is reviewed by one of the two clinic physicians. A complete history and physical examination is obtained on each patient. Laboratory studies include a complete blood count, a fasting blood sugar, a protein-bound iodine, and several hepatic function tests. Each patient is instructed to faithfully record, as ingested, each portion of food consumed. This actual diet is reviewed each week with a physician who points out the nutritional

errors and suggests methods of taking in less calories while attempting to improve nutritional content. It is with these personally-recorded diets that this paper deals.

RESULTS

From the patients processed so far, we have been unable to find any who would fit into the "stuff and starve" concept. From our analysis of the initial diets handed in and from subsequent diets which are kept continuously throughout the clinic program, we have found that practically all the patients eat at least two meals a day. If an entire meal is skipped, a snack is often consumed two hours later.

Eighty-two per cent of the patients eat breakfast, with 54% of this number eating more than 700 calories. Most of the patients (72%) eat lunch, with occasional exceptions who attempt to lose weight by skipping this meal. The last scheduled meal of the day is usually the largest; however, between-meal snacks begin some time after breakfast and gain full force after lunch, with 54% having had the first snack before lunch and 76% having had at least one snack after lunch. Ninety per cent of the patients continue to eat after dinner, but only 38% of the patients give a history of insomnia and the "night-eating syndrome" in its mildest form.

In subsequent diets which are recorded and reviewed, we have found that the between-meal snack usually does not disappear but rather changes in character as the patient receives more nutritional guidance. Since the patients are encouraged to increase their intake of protein, we find snacks consisting of meat products replacing cake and candy. Some patients use unflavored gelatin in a fresh fruit juice or skim milk. The most difficult snack patterns to break are the after-dinner snack the "company" type of snack, when one must be a good hostess or guest and accept the customary offerings; however, even these snacks gradually diminish or are altered for less calories and more nutritious items.

SUMMARY

After one year and more than 100 patients, we believe that the clinic population of our Anticalory Clinic has much to offer in the investigation of human eating patterns of obesity as opposed to those of rats. Our patients 96% of whom are women between the ages of 20 and 50, have faithfully (we hope) recorded their actual and, at the beginning of the program, customary dietary intake. All such diets have an overabundance of calories and more carbohydrates and fats than recommended for proper nutrition; however, in contrast to the popular idea that the obese patient skips meals during the day and eats mainly at night, most of our clinic population eats three meals a day with frequent snacks between meals and the heaviest intake at night. In most cases, this evening eating pattern appears to be a manifestation of our social climate, with television and other sedentary activities as contributing factors, rather than some hypothalamic or enzymatic abnormality. Our study suggests that the obese person does not indulge in a "stuff and starve" program but rather in a one-meal-all-day-long pattern which not only produces but maintains the corpulent state.

It would appear that the overweight person must still depend on the usual methods of losing weight; ie, 1) take in less calories, 2) change his eating habits to include more nutritious foods, and 3) be motivated enough to lose weight to seek help through an out-patient clinic or other medically-supervised program. We believe that our clinic population is typical of the corpulent population in this country who seek medical advice. This is not to dispute the possibility that some obese patients may have a metabolic defect in their lipogenesis or in their hypothalamic apparatus, but whether this is cause or effect is yet to be proven.

When uncontrolled diarrhea brings a call for help

When the diarrhea sufferer has run the gamut of home remedies without success, pleasant-tasting CREMOMYCIN can answer the call for help. It can be counted on to consolidate fluid stools, soothe intestinal inflammation, inhibit enteric pathogens, and detoxify putrefactive materials—usually within a few hours.

CREMOMYCIN combines the bacteriostatic agents, succinylsulfathiazole and neomycin, with the adsorbent and protective demulcents, kaolin and pectin, for comprehensive control of diarrhea.

Indications: Diarrhea. *Contraindications:* Kaolin Withhold if diverticulosis is present or suspected *Precautions:* Sulfonamide: Continued use requires supplementary administration of thiamine and vita

your ℞ for Cremomycin can provide relief

min K. Neomycin: Patient should be observed for new infections due to bacteria or fungi. *Side Effects:* Sulfonamide: Sensitivity reactions may occur (e.g., skin rashes, anemia, polyneuritis, fever; agranulocytosis with a fatal outcome has been reported). Reduction of thiamine output in the feces and of vitamin K synthesis has been observed. Neomycin: Nausea, loose stools possible.

Before prescribing or administering, read product circular with package or available on request.

HISTORY OF THE BALTIMORE CITY HOSPITALS

BY DOUGLAS CARROLL, M.D.

Chapter 4.—The Almshouse at Calverton: Contemporary Pictures and Comment (1822-1865)

A number of charming drawings of the Almshouse at Calverton have come down to us. Figure 1 shows the Almshouse and inmates. Figure 2 is the ground plan of the Almshouse showing the ice house, the dead house, and the male privy lined up along the back wall with open sewage passing out into the meadows. Figure 3 shows the medical records of patients admitted in June of 1823.

Three contemporary descriptions of the Almshouse at Calverton follow. The third, published in 1844, goes beyond description to draw the conclusion that life at the Almshouse is too easy on vagrants. The fact that the Almshouse had only 600 inmates is attributed to the easy access to the west and the presence of slaves.

1. LATROBE, JOHN HAZLEHURST B.: *Picture of Baltimore,* p 150-153, 1832.

The centre building of this establishment, originally the dwelling of a private gentleman, is very large, and was erected after a design of R. C. Long, esq. It is now occupied by the overseer, physicians, & c. The front is 55 feet, and the depth 53. There are two wings, 130 by 40 feet each, of two stories, and a basement occupied by the paupers, and connected with the centre building by covered galleries. The whole front 375. A bath-house, wash-house, bake-house, and spacious court yard, are in the rear.

To this important institution is attached a good body of land on high ground and having a stream of water running through it. The poor of the county and city are sent to this establishment, and such as are able are made to work and receive credit for their labour as an offset against the cost of maintaining them. For this purpose, the farm on which the Almshouse is situated affords admirable opportunity. Few places in the neighborhood of Baltimore are more worthy of notice than the Almshouse.

There are twelve ward managers for the poor, and four trustees, under the care of the last of whom, is the Almshouse more immediately placed.

The following extract from the report of the Trustees of the Poor for 1831, exhibits the situation and character of the institution at this time:

"There were admitted into the house during the year, ending the 30th April, 1831, including 21 births, 1160 paupers; discharged, 387; bound, 30; deceased, 237; eloped, 447; leaving, 567 paupers, including those before in the house.

"Although the number of admissions, into the Almshouse, from the increase of population and other causes, has been gradually augmenting, the trustees are gratified to find, on referring to their reports for several years past, the demand for the ensuing year, upon the funds of the Mayor and City Council, to be less than that of preceding years.

"The expenditure per head, for supporting the poor, for the year ending the 30th April, 1826, was 37 dollars 63 cents, and same has been gradually reduced, until, for the year ending the 30th April, 1831, it amounted only to 25 dollars 72 cents per head. In this estimate are included all charges for farming expenses, permanent improvements on the estate, repairs, salaries, and contingencies, excepting only the interest on the Calverton debt.

"The reduction of expenditure is principally to be attributed to the increased productiveness of the farm, and to the quantity and value of the articles made up, or manufactured, in the house, furnishing not only supplies of food, clothing, & c., for the use of the institution, which would otherwise be purchased, but affording a considerable quantity for sale. The carpenter's and other mechanical work done by the paupers, forms also a large item in the avails of the establishment, which serve to lessen the demand upon the public funds.

"Besides reducing the cost of maintaining the paupers, the requisition of some sort of labour from such as are able to work, has a still more beneficial and important effect, as it tends to prevent an increase in the house, of the idle and lazy, who are able to maintain themselves.

"The trustees have frequently adverted to the fruitful source of nearly all the pauperism that comes under their notice, the intemperate use of ardent spirits. They have now the satisfaction, however, to say, that the rule of

Fig 1

Alms House, Calverton, from Latrobe, J.H.B.: Picture of Baltimore, 1832.

the institution forbidding the use of any vinous, spiritous, or fermented liquor, as an article of diet, has been strictly enforced, and the late harvest at the farm, which employed several hands, was secured without any such allowance."

2. VARLE, CHARLES: *A Complete View of Baltimore*, 3:90, 1833.

The trustees of the poor of Baltimore county, were incorporated in the year 1773. They formerly occupied, for the accommodation of the poor of the city and county, a neat shewy building, situate in the upper part of North Howard Street, but about ten years past, finding this building was too small, they purchased "Calverton," the county seat of Dennis A. Smith, with its splendid mansion, to which they added two wings of 130 by 40 feet each, and other necessary out-buildings, and thereby formed the present large and elegant Almshouse, which, in point of extent, convenience, and beauty of location, certainly is not surpassed by any similar establishment in the United States. It is situated about 2½ miles from the court-house, in a north-western direction, on the Franklin M'Adamized road, and is well worthy of being visited by strangers. The expense of the purchase and improvement of this place amounted to $100,000. Its con-

cerns are managed by five trustees, who at present are Joseph Cushing, John Kelso, Frederick Schaeffer, Joshua Hutchins, and Archd. Sterling.

To convey some idea of this institution, I have extracted the following statements and table from the records of the mayor's office, viz.

There were in the house April 30, 1830, paupers		558
And there were admitted during the year ending April 30, 1831, including 21 births, paupers		1,160
	Making	1,718
Of which, in the same period, there were:		
discharged	387	
bound out	30	
deceased	287	
eloped	447	1,151
Leaving in the house		567

Statement of the habits of the paupers admitted into the house in the year ending April 30, 1831, to wit:		
Adults of temperate habits	27	
Of intemperate habits	960	
Whose habits in respect to temperance were unkown	19	
	1,006	
Children of temperate parents	18	
Of intemperate parents	119	
The habits of parents unknown	17	154
		1160

Places of birth of the paupers admitted during the said period, viz.

Almshouse	21	Rhode Island	3
Baltimore County ...	86	Connecticut	2
Baltimore City	200	New York	17
Eastern Shore of Maryland	107	New Jersey	4
Other parts of Maryland	120	Pennsylvania	53

East Indies	2	Holland	1
England	51	South America	2
Ireland	349	Africa	2
Scotland	15	Unknown	9
France	5		1160

3. GODLEY, JOHN ROBERT: *Letters from America,* 2:177-178, 1844.

I have paid a visit to the Baltimore Almshouse, a large building, in a beautiful situation, about three miles from the town, surrounded by 300 acres of land, principally under cultivation, the labourers on which are all paupers. It seems very well conducted, presenting, in this respect, a favourable contrast to similar institutions in some of the other large towns: the house is clean, orderly and comfortable; and really, with plenty of good food and clothing, occupation, either on the farm, or at any trade which he may be acquainted with, care taken

Effective Convalescent Care . . .

of him when he is sick, and the power to go away when he pleases, the inmate must lead a very satisfactory life; indeed those to whom I spoke admitted it, and said distinctly that they were far better off in point of physical comforts than the generality of labourers in the neighbourhood at this moment (a period of distress, be it recollected), not to speak of the slaves. Now this must be wrong. Without any wish for harsh tests of destitution, it is surely not too much to say that the industrious labourer, who struggles to maintain himself and his family independently, ought not to see his next-door neighbour, equally able-bodied and capable in every respect, but who prefers the comparative idleness of an almshouse, better off than himself. The principle is false, and in a crowded state of society would be fatal. As it is, though applicants are never rejected, I was surprised to find that the average number of inmates does not quite amount to 600; but the easy access to the West, and the fact that a large proportion of the lowest class are slaves (who of course are not admitted), accounts for this: about two-thirds of the paupers are native Americans, the rest almost entirely Irish and Germans.

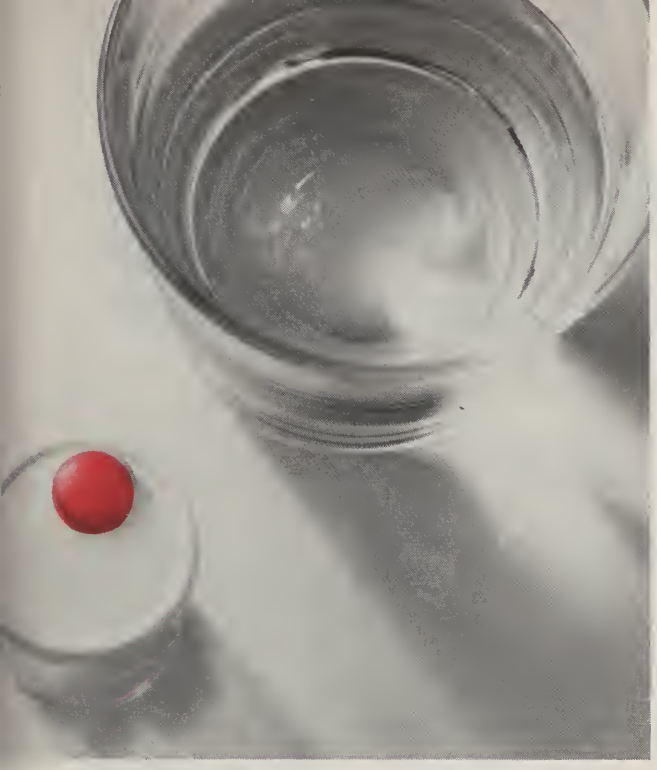
WICOMICO COUNTY

At the February meeting, members of the Wicomico County Medical Society heard the State Commissioner of Health, **William J. Peeples, MD,** describe requirements for the home health services provided under the new Medicare law.



Dr. Peeples outlined the organizational structure which would be required to provide these services, the anticipated cost, and sources of possible financing to cover the deficit expected from federal payments.

After the presentation and a question and answer period, the medical society voted to ask the nominating agency to consider appointment of three medical society members to the health services advisory board, and endorsed health department administration of the program.

Among other actions taken at the same meeting, a motion was passed in support of the "implied consent" bill introduced by Senator Mary L. Nock at the current session of the Maryland Legislature. This bill provides for chemical testing of drivers suspected of being under the influence of alcohol.

Other special guests at the February meeting included **Edward Davens, MD,** deputy health commissioner, **DeWitt Boyd, MD,** health department liaison officer, **Mrs. Margraff,** also of the State Department of Health, **Ivory U. Sully, MD,** president of the Worcester County Medical Society, and **C. G. Rawley, MD,** president of the Somerset County Medical Society.

Mrs. Kit Hargreaves

one mid-morning **one mid-evening**

New 300 mg tablet It's made for b.i.d.

For Adults–2 tablets provide a full 24 hours of therapy...with all the extra benefits of DECLOMYCIN...lower mg intake per day...proven potency... 1-2 days' "extra" activity to protect against relapse or secondary infection.

DECLOMYCIN®

DEMETHYLCHLORTETRACYCLINE

300mg FILM COATED TABLETS

Effective in a wide range of everyday infections—respiratory, urinary tract and others—in the young and aged—the acutely or chronically ill—when the offending organisms are tetracycline-sensitive.

Warning — In renal impairment, usual doses may lead to excessive systemic accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of discomfort.

Precautions and Side Effects — Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. Use of demethylchlortetracycline during tooth development (last trimester of pregnancy, neonatal period and early childhood) may cause discoloration of the teeth (yellow-grey-brownish). This effect occurs mostly during long-term use but has also been observed in short treatment courses. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment. Side reactions include glossitis, stomatitis, proctitis, nausea, diarrhea, vaginitis and dermatitis. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Anaphylactoid reactions have been reported.

Contraindication—History of hypersensitivity to demethylchlortetracycline.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products.

Capsules: 150 mg of demethylchlortetracycline HCl.

Tablets: film coated, 300 mg, 150 mg, and 75 mg of demethylchlortetracycline HCl.

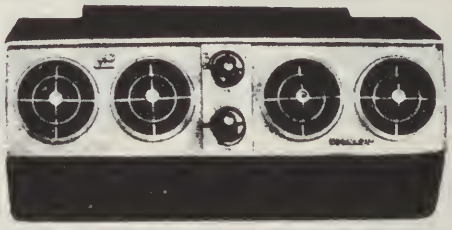
The Science of Communication as practiced at Monumental Printing

It's more than a science: it's an Art, the precise transliteration in print of an intangible idea for a heterogeneous group of critical readers.

Here, at Monumental Printing, we learned to handle the tools of intelligent communication by the empirical method: working with them. The brush and palette of our art, the chisel, the score, the script are simply words on paper. We learned their proper use over 50 years of practice by being permitted to print such Journals as:

Clinical Chemistry
Digestive Diseases
Fertility & Sterility
Occupational Medicine
Leprosy
Mental Hospitals
Psychiatric Studies and Projects
Psychosomatic Medicine

We speak your language. We know the difference between edema and enema; syndrome and symptom; sewage and sewerage. And when and why we should use 12 point Caslon Bold instead of 10 point Stymie.



If you, too, need a good printer, let's communicate!

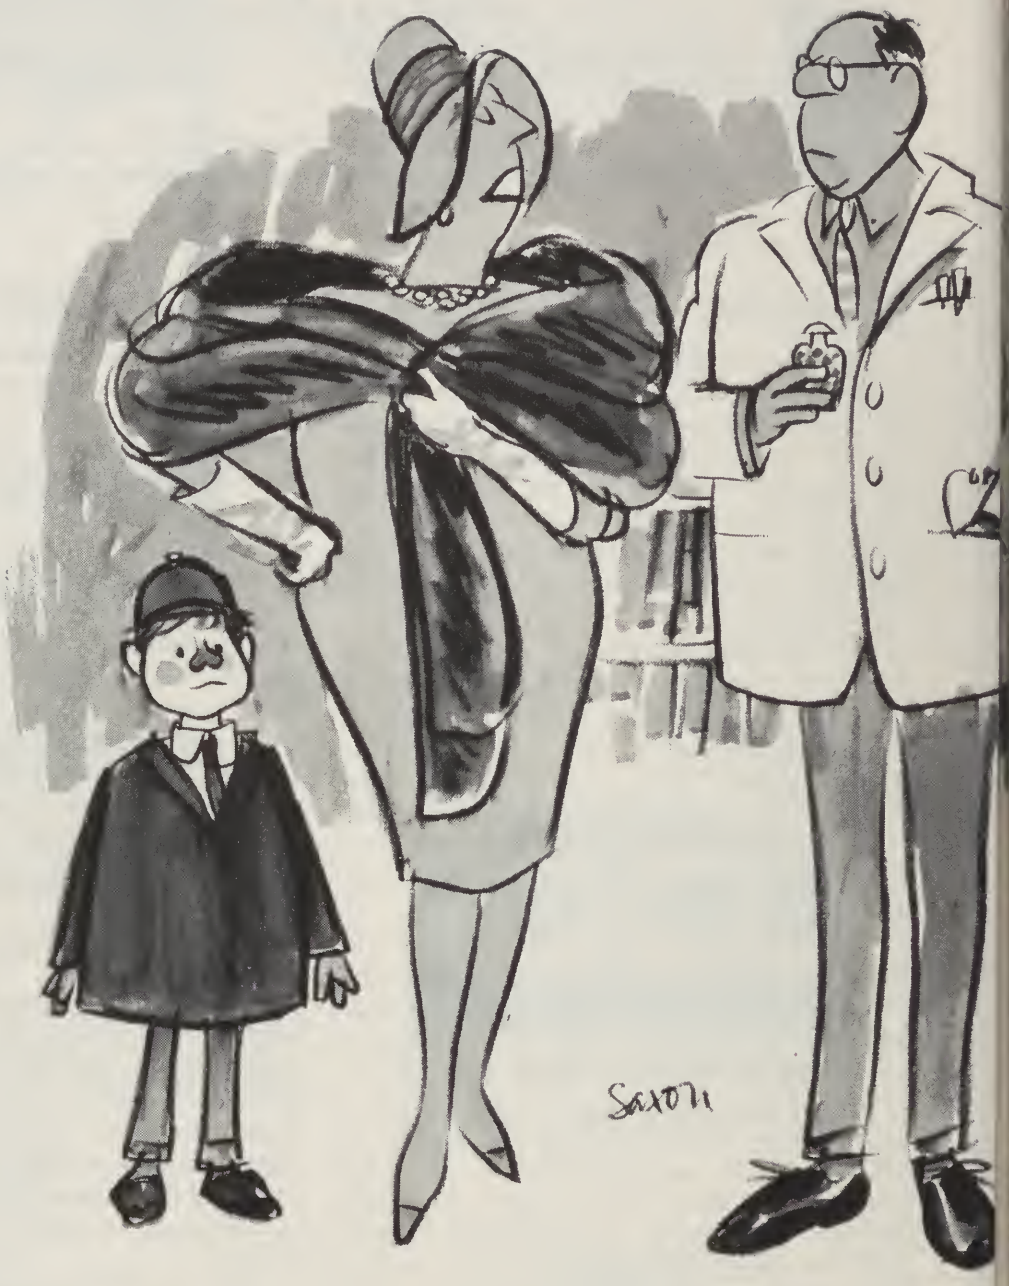
SOCIETY OF PATHOLOGISTS INC.
ROBERT G. LANCASTER, MD, *President* W. BRADLEY KING, JR., MD, *Secretary*
MITCHELL ROSENHOLTZ, MD, *Chairman, Editorial Committee*

Medicine—The Outward Look From Within A Specialty

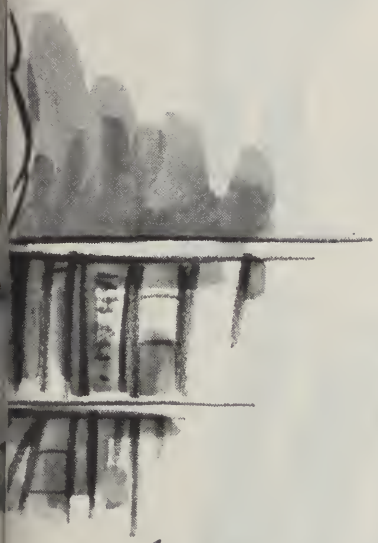
CHARLES S. PETTY, MD
Past President, Maryland Society of Pathologists, Inc.

Societies and other groups of individuals with common interests often find themselves existing for their own purposes. This tendency, tempting though it may be, must be resisted if that particular body of men is to create a durable and useful tool for mankind. Specialty groups in medicine have been accused, often with some element of truth, of existing only for their own aggrandizement.

The Maryland Society of Pathologists, Inc., is one such specialty group which has been so charged. As the outgoing president of this organization, I feel a duty to make note of the outward-directed activities of the organization during 1965. It is with a comfortable feeling that I can detail several activities completely devoted to the broad aspects of medicine and not to the narrow realm of pathology.



1. The Medical and Chirurgical Faculty of Maryland, pleased with the health evaluation tests for physicians at the annual meeting, again requested the Maryland Society of Pathologists, Inc., to chair and to implement this program. In 1965, a dozen or more pathologists, all members of this Society, directed the analysis of blood and urine specimens and the statistical evaluation of results derived from the nearly 250 physicians who took the opportunity to check their own health status. The Maryland Society of Medical Technologists, the Heart Association of Maryland, the Maryland Ophthalmological Society, and the Maryland Radiological Society shared in offering this screening program to physicians. This project was brought to completion by a specialty group working toward the goal of better medicine in its broadest sense.



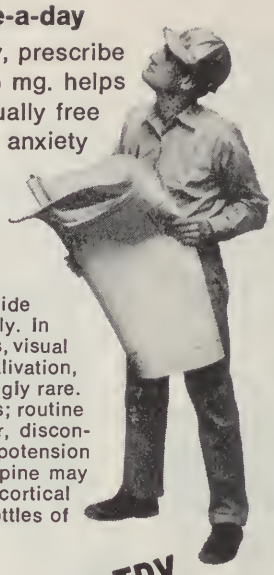
2. The Maryland Society of Pathologists, Inc., has contributed members active in the proper interpretation and, hopefully, the proper instrumentation of the controversial Medicare legislation. This activity of the Society is directed toward the progress of American medicine in its broadest aspects, not simply to the furtherance of a specialty group.

3. The educational program, begun years ago as a joint activity wtih the Maryland Society of Medical Technologists, was continued during 1965. Under the auspices of this program, workshops, seminars, discussions, and other forms of education have been carried out. During the past year, seminars in renal function, hematology, and clinical enzymology were held and were well attended, primarily by the medical technologists from the state.

4. A page is published monthly in the MARYLAND STATE MEDICAL JOURNAL by the Maryland Society of Pathologists, Inc. This provides information of interest and value to all physicians. During 1965, topics such as "Preservation of Medical Evidence," "The Medical Case in the Court of Law," "Exfoliative Cytopathology," "Administration of Blood and Other Intravenous Fluids in the Baltimore Area," were presented for the benefit of physicians in fields other than pathology.

These efforts do not comprise the entire outward look from within the specialty nor the entire outward directed program from within the Maryland Society of Pathologists, Inc. However, these four activities, emphasizing better health for physicians, education for physicians and technicians, and the broad aspect of the social impact of Medicare, are part of a small specialty's contribution to the betterment of medicine as a whole.

Look, Doctor, what he needs is a shot of penicillin.



Maybe. Maybe not. In any case, he needs something to control his cough.
If it's the useless, exhausting type of cough that often accompanies respiratory infection or allergy, you can provide prompt relief with Novahistine DH. Its decongestant-antitussive action controls frequency and intensity of cough spasms without abolishing cough reflex. And the fresh grape flavor of Novahistine DH appeals to children and adults alike.
When your diagnosis is bronchitis, complicated by thick tenacious exudates, Novahistine Expectorant is particularly useful. It not only provides decongestive action and controls the cough, but also encourages expectoration, thus easing bronchial obstruction.
Use with caution in patients with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Ambulatory patients should be advised that drowsiness may result. Continuous dosage over an extended period is contraindicated since codeine phosphate may cause addiction.
Each 5 ml. teaspoonful of Novahistine DH contains codeine phosphate, 10 mg. (Warning: may be habit forming); phenylephrine hydrochloride, 10 mg.; chlorpheniramine maleate, 2 mg.; chloroform (approx.), 13.5 mg.; l-menthol, 1 mg. (Alcohol 5%). Each 5 ml. of Novahistine Expectorant contains the above ingredients and, in addition, glyceryl guaiacolate, 100 mg.

NOVAHISTINE® DH
NOVAHISTINE® EXPECTORANT

DOW **PITMAN-MOORE** Division of The Dow Chemical Company, Indianapolis

Blueprint for dealing with tension due to stress — Prolixin — once-a-day

For the patient who must be on the job mentally as well as physically, prescribe Prolixin. The prolonged tranquilizing action of as little as one or two mg. helps him cope with tension all day long. Markedly low in toxicity and virtually free from usual sedative effects, Prolixin is effective in controlling both anxiety associated with somatic disorders and anxiety due to environmental or emotional stress. Patient acceptance is good — because Prolixin is low in cost, low in dosage and low in sedative activity. Prescribe Prolixin.

Side Effects, Precautions, Contraindications: As used for anxiety and tension, side effects are unlikely. Reversible extrapyramidal reactions may develop occasionally. In higher doses for psychotic disorders, patients may experience excessive drowsiness, visual blurring, dizziness, insomnia (rare), allergic skin reactions, nausea, anorexia, salivation, edema, perspiration, dry mouth, polyuria, hypotension. Jaundice has been exceedingly rare. Photosensitivity has not been reported. Blood dyscrasias occur with phenothiazines; routine blood counts are recommended. If symptoms of upper respiratory infection occur, discontinue the drug and institute appropriate treatment. Do not use epinephrine for hypotension which may appear in patients on large doses undergoing surgery. Effects of atropine may be potentiated. Do not use with high doses of hypnotics or in patients with subcortical brain damage. Use cautiously in convulsive disorders. **Available:** 1 mg. tablets. Bottles of 50 and 500. For full information, see Product Brief.

Evaluation of the Hypertensive Patient

JAMES L. CLIFFORD, MD

Successful treatment of the hypertensive patient depends on an accurate diagnosis. The evaluation has three major objectives: 1) to establish the consistency of the blood pressure elevation, 2) to determine the extent of target organ involvement, 3) to determine if there is an underlying specific cause for the hypertension. The last objective is extremely important since it may be surgically correctable.

The history should establish the time of onset and the familial prevalence, since these factors may vary between essential and secondary hypertension. Symptoms directly attributable to blood pressure elevation are not common early. Their presence may indicate significant underlying target organ involvement. A history of diabetes, motor lability, muscle weakness, and physical stress should be noted.

Physical examination should include evaluation of the optic fundi and a neurologic examination. Blood pressure determinations should be done repeatedly to determine the basal level. If the patient is hospitalized, the basal pressure may be obtained by sodium amytal sedation. Auscultation of the blood pressure in the lower extremities may be used to rule out aortic coarctation. Hypertension is assumed to be associated with accelerated atherosclerosis, and the manifestations should be considered. The pulsations in the extremities, carotid arteries, and the abdominal aorta should be palpated. Abdominal aortic aneurysms are more common with blood pressure elevation. Auscultation of the carotid and femoral arteries, the abdomen, and the flank may reveal a significant bruit.

The purpose of the basic laboratory investigation is to indicate what further diagnostic procedures are needed and to assess the degree of involvement of the organs tested. In addition to the CBC and urinalysis, a BUN, PSP, urine colony count, and serum sodium, potassium, chloride, and CO_2 should be obtained. An ECG may show evidence of cardiac enlargement. X-ray studies should include a postero-anterior and lateral chest film and a timed IVP with films taken at one, three, and five minutes. In unilateral renal disease the dye may appear earlier in the unaffected side. A discrepancy of 1cm or more in length of the kidneys suggests that the smaller kidney may be involved.

The following specific causes of blood pressure elevation should be further studied, if suspected:

1. **Bilateral renal disease.** Indications are anemia, azotemia, proteinuria, abnormal urinary sediment, or a history of previous renal disease. Useful studies are quantitative protein determinations, retrograde urogram, urinary sediment examination, and renal biopsy.
2. **Unilateral renal disease.** There may be sudden or early onset of hypertension or acceleration of a pre-existing hypertension. History may indicate abdominal pain, trauma, or evidence of thrombotic or embolic phe-

nomenon. Auscultation may reveal a bruit over the abdomen or flank. The IVP should be noted for discrepancy in renal filling time or size. Renal arteriograms, the radioisotope renogram, and split renal function studies allow complete evaluation.

3. **Pheochromocytoma.** The blood pressure elevation may be sustained or paroxysmal. If the diastolic pressure is above 110 mm Hg, a regitine test may be used. A diastolic pressure below this calls for histamine stimulation. Specific information is obtained from the collection of a 24-hour urine specimen for catecholamines.
4. **Cushing's syndrome.** Physical findings are moon face, obesity, hirsutism, and abdominal striae. There may be leukocytosis, polycythemia, diabetes mellitus, and kidney displacement by x-ray. The specific diagnosis is obtained by 24-hour urine collection for 17-keto and 17-hydroxycorticosteroids and their reaction to dexamethasone suppression.
5. **Primary aldosteronism.** Clinical manifestations are periodic muscle weakness or paralysis, paresthesias, polyuria, and nocturia. Laboratory studies may indicate serum potassium depression with elevation of the CO_2 and sodium. Current studies indicate that the condition is present long before electrolyte changes occur. A 24-hour urine collection for aldosterone should be obtained. Secondary aldosteronism frequently is associated with accelerated hypertension or hypertension of renal vascular origin.
6. **Coarctation of the aorta.** The blood pressure is lower in the legs than in the arms in this condition. Rib notching or a small aortic knob may be seen on x-ray film. Angiography will definitely establish this diagnosis.

REHABILITATION Notes

BALTIMORE CITY MEDICAL SOCIETY,

DOUGLAS G. CARROLL M.D.
EDITOR

THE BURDEN OF CHRONIC DISEASE

Survey of 556 Serial Admissions to the Acute Medical Service at the Baltimore City Hospitals

DOUGLAS CARROLL, MD

The medical care of patients with chronic diseases is a major public health problem. This survey attempts to identify the diseases which cause the most prolonged disability, use up the most hospital time, how much they are benefited by hospitalization, and what their disposition may be.

Between November 1, 1961, and March 1, 1962, 556 patients were admitted to the acute medical wards at the Baltimore City Hospitals. Sixty per cent were white, and 58% were male. Three per cent were under 20 years (15 is the lowest age on the medical wards); 8% were in the third decade, 10% in the fourth, 11% in the fifth, 17% in the sixth, 21% in the seventh, 19% in the eighth, 10% in the ninth, and 1% was over 90. Half of the patients were over 60.

Many patients had more than one disease, and it was often difficult to specify the principle disease. It was usually possible, however, to identify the disease causing immediate admission to the hospital; this was called "major disabling diagnosis."

Diagnosis and Age

Table 1 shows the major disabling diagnosis in relation to age, sex, and race. Arteriosclerotic and hypertensive cardiovascular diseases were the most common causes of admission. Pulmonary tuberculosis, pneumonia, and emphysema were the leading pulmonary diseases (excluding neoplasms of the lung). The most common psychiatric diseases were acute and chronic alcoholism, suicidal attempts, and chronic brain syndrome. Bronchogenic carcinoma was at least three times more frequent than any other neoplasm. Of the gastrointestinal diseases, liver disease, upper gastrointestinal hemorrhage, and acute gastroenteritis were the most common diagnoses (many being complications of alcoholism). Diabetes mellitus was five times as common as all other endocrine and metabolic diseases combined.

Duration of Major Disability

Table 2 shows the impact of the major disabling diagnosis in terms of duration of disability and length of hospital stay. The time of onset of disability was that point at which the patient no longer contributed to the community in terms of work, self-support, or self-care appropriate to his age, sex, and disability and began to depend

on social agencies, hospital, or family *because of his disease.* Since this determination was not always accurate, many of the figures for duration of disability are approximate.

Forty-two per cent of the patients had been disabled for more than a year before admission, 25% for one week, and the remaining 33% from one week to one year.

The following percentages of the diagnostic groups had been disabled for more than a year: neurologic, 55%; psychiatric, 54%; musculoskeletal, 53%; neoplasms, 50%; cardiovascular, 50%; cerebrovascular, 41%; hemic and lymph, 38%; respiratory, 31%.

Diagnosis in Relation to Time in Hospital

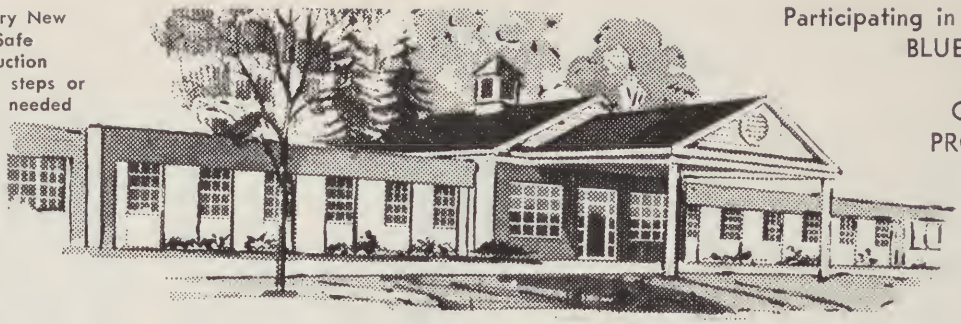

Table 3 shows that a high death rate within six months after hospitalization partially accounts for the small number of patients with cardiovascular disease and neoplasm still in the hospital at the end of six months. The high mortality in patients with cerebrovascular disease is explained by the multiple diseases (hypertension, arteriosclerotic heart disease, diabetes mellitus, and renal failure) so frequently associated.

A large number of patients with respiratory, cardiovascular or cerebrovascular, psychiatric, and musculoskeletal disorders were transferred to a subacute hospital to await final transfer to a nursing home (Table 3). These represent the long term patients generally cared for by nursing homes.

Summary

This survey demonstrates the toll of chronic disease in terms of the prolonged dependence before hospitalization, the long hospital stay with little improvement (particularly in patients with

cardiovascular disease, uremia, respiratory failure, and neoplasms), and the overwhelming morbidity caused by alcoholism, diabetes mellitus, and arteriosclerosis (and their complications).

Most patients admitted to the Baltimore City Hospitals are elderly welfare patients and therefore are a selected group with a high incidence of disabling chronic diseases. Probably the advent of Medicare will shift some of this population to other hospitals now treating mostly private patients.

In dealing with these patients, there are five primary requirements for good medical care: 1) no curable or treatable disease should be missed in the diagnosis; 2) a comprehensive survey of the patient's potential for self-help and independence must be made; 3) every effort must be made to establish each patient at his maximal medical, psychological, physical, domiciliary, financial, familial, and vocational potential; 4) when all resources for the patient's benefit have been fully exploited, the patient must be placed promptly in a facility most appropriate for his needs; 5) he must be followed with adequate medical and social care.

Doctor,

Here is the Abbott anorectic program designed to meet the individual needs of your overweight patients.

ABBOTT

mood elevation

Abbott
Anorectic
Program

DESOXYN® Gradumet® (methamphetamine hydrochloride)

mooth appetite control plus mood elevation.

he obese patient on a diet often has to battle epression as well as overweight. Desoxyn Gradmet helps the dieter in both battles by elevating ıe mood while it curbs the appetite. Thanks to ıe Gradumet, medication is smoothly released ll-day from a single oral dose.

If she can't take plain amphetamine, put her on DESBUTAL® Gradumet

Calms anxieties; controls compulsive eating.

Desbutal Gradumet provides 2 drugs in 2 tablet sections, combined back to back to form a single tablet. One section contains Desoxyn to curb the appetite and lift the mood; the other contains Nembutal® (pentobarbital) to calm the patient and counteract any excessive stimulation.

Both drugs are released in an effective dosage ratio throughout the day.

controlled release

Not all long-release vehicles are the same. Here is why the Gradumet is different and what it means for your overweight patients.

The release action is purely physical and relies on only one factor common to every patient: gastrointestinal fluid. There is no dependence on enteric coatings, enzymes, motility, or an "ideal" ion concentration in the gastrointestinal tract.

Your patients get a measured amount of medication, moment by moment, throughout the day.

They are not subjected to ups and downs of drug release . . . or to erratic release from patient to patient . . . or to erratic release in the same patient from day to day.

That's why the Gradumet provides controlled-release as well as long release.

Perhaps you saw the Gradumet model demonstration which shows that the release is entirely physical. When fluid is added, the drug in the outer ends of the channels dissolves. As fluid penetrates deeper into the channels, there is a continuous release of medication. The rate of release is rigidly controlled by the size and number of channels.

at Merck Sharp & Dohme...

understanding... precedes development

The development of chlorothiazide and probenecid were events of major importance, but perhaps even more important for the future was the Renal Research Program by which they were developed. When Merck Sharp & Dohme organized this program in 1943, it was expressing in action some of its basic beliefs about research:

- Many problems connected with renal structure and function were still undefined or unsolved. The Renal Research Program would begin its basic research in some of these problem areas.
- From knowledge thus acquired might come clues to the development of new therapeutic agents of significant value to the physician.

For example, the Renal Research Program put fifteen years into this search before chlorothiazide became available. But because these years had first led to a greater understanding of basic problems, the desired criteria for chlorothiazide existed before the drug was developed.

Along with other research teams at Merck Sharp & Dohme, the Renal Research Program continues to add new understanding of basic problems—understanding which will lead to important new therapeutic agents.

MARYLAND RADIOLOGICAL SOCIETY
ORGANIZED 1953
President—James A. Lyon, Jr., MD
Editor—Donald A. Wolfel, MD

1A. 44 WM. Admitted to hospital for evaluation of right lower quadrant mass. Non-visualization of right kidney.

1B. Right kidney is not visualized, but terminal ureter on right is seen and its proximal portion is displaced medially.

1C. Right posterior oblique view projects calyceal system away from bony pelvis allowing visualization of a right pelvic kidney.

RADIOGRAPHIC DIAGNOSIS OF PELVIC KIDNEY

HUGH F. MORRISH, MD

Absence of a functioning kidney in the normal position, as shown by intravenous pyelogram, should suggest the possibility of an ectopic kidney. Ectopic kidneys usually are located in the pelvis and may be extremely difficult to visualize by routine intravenous pyelography. Oblique views frequently project the calyceal structures of the pelvic kidney away from the bony structures of the pelvis, enabling correct interpretation.

Ectopic pelvic kidney is found in one in 700-800 autopsies.[1] Its cause is failure of the kidney to ascend to its normal position during fetal life, being held in abnormal position by vascular attachments which are characteristically aberrant.

From the Department of Radiology, The Johns Hopkins Hospital, Baltimore. This work was supported in part by USPHS Grant No. 5TI GM 1328.

2A. 24 WM Abdominal mass detected on routine employment physical examination. Non-visualization of the right kidney.

The ectopic kidney derives its blood supply from adjacent major vessels, usually the iliac or hypogastric arteries. Frequently smaller and more lobulated than normal, it is commonly associated with malrotation and anterior position of the renal pelvis. This configuration may have a bizarre appearance on the pyelogram. The length of the ureter corresponds to the position of the kidney and is short. The short ureter helps differentiate the congenital ectopic kidney from the ptotic kidney which has a normal ureter. Pelvic kidney is more common in males than in females and more often involves the left kidney.

The patient may present with a pelvic mass. Occasionally this mass may obstruct labor. Inflammatory disease within the ectopic kidney may simulate appendicitis or other intra-abdominal disease. Ectopic kidneys may exert pressure on the bladder or bowel.

The proper radiographic diagnosis requires a high degree of suspicion and keen observation. Failure to demonstrate a functioning kidney in the normal position demands a persistent search for a possible ectopic kidney. Fragmentary filling of the calyceal system may be almost impossible to identify when superimposed upon the bony pelvis. The use of oblique views frequently allows excellent visualization of the collecting system of the pelvic kidney by projecting it free of the bony pelvis (figs 1C and 2C). Visualization of the terminal ureter without recognition of the kidney itself indicates ectopic kidney (figs 1B and 2B).

Routine oblique views in intravenous pyelography are recommended not only because they provide the diagnosis of pelvic kidney but also because they are useful in evaluating ureteral stones, renal and nonrenal calcifications, and the calyceal systems themselves. Often oblique views give excellent visualization of the renal contour.

The relative frequency of pelvic kidney calls for caution in the routine use of pelvic pressure as a means of obtaining better filling of the upper urinary tracts during excretory urography. Pressure should not be applied until the kidneys have been located, either by an adequate preliminary examination or, preferably, after the first excretory radiograph.

Summary

The most important feature in the radiographic diagnosis of pelvic kidney is a high index of suspicion followed by a careful search for the ectopic kidney. This search is motivated by failure to visualize the kidney in the normal position or by visualization of the distal ureter without appreciation of the kidney itself.

First aid for a button popper

Second aid for a button popper

By providing combined anorexigenic-tranquilizing action, BAMADEX SEQUELS Capsules help your nonshrinking patients to establish new patterns of eating less. The amphetamine component suppresses the appetite, while the meprobamate helps allay nervousness and tension. And for most patients, the *sustained* release of the active ingredients provides convenient one-capsule-a-day dosage.

Side Effects commonly associated with either component are possible but, to the extent these are dose-related, they should normally be mild and infrequent, since the total dosage of each component on the usual one-capsule-daily regimen is quite low. Also, the sedating effect of meprobamate and the stimulating effect of d-amphetamine sulfate tend, to some extent, to cancel each other out. Adverse effects not peculiar to either component have not been reported. Side effects associated with d-amphetamine sulfate include: insomnia, excitability, increased motor activity, confusion, anxiety, aggressiveness, increased libido, hallucinations, rebound fatigue, depression, dry mouth, anorexia, nausea, vomiting, diarrhea and increased cardiovascular reactivity. Effects associated with meprobamate include: skin rash, nonthrombocytopenic purpura with petechiae, ecchymoses, peripheral edema, fever and transient leukopenia; also, very rarely, fainting spells, angioneurotic edema, bronchial spasm, hypotensive crisis, anuria, stomatitis, proctitis and anaphylaxis. Other serious effects have occurred after concomitant administration of meprobamate and other drugs. Massive overdosage may produce grave effects.

Precautions: BAMADEX SEQUELS should be given only under close supervision to patients hypersensitive to sympathomimetic drugs, with cardiovascular or coronary disease or who are severely hypertensive; to emotionally unstable persons and to epileptics. Patients should be cautioned not to drink alcoholic beverages while on the drug, and not to drive vehicles if they become drowsy. In all patients kept on the drug for long periods, the drug should be withdrawn gradually to avoid possible serious reactions.

Contraindications: Hyperexcitability, agitated prepsychotic states and a history of previous reactions to meprobamate.

Bamadex® Sequels®

Alcoholism SECTION

From the Subcommittee on Alcoholism of the Medical and Chirurgical Faculty of the State of Maryland

Broad Attack on Alcoholism Urged

PHILADELPHIA—A comprehensive public health approach to alcoholism, instead of current "piecemeal" methods of research and treatment, was urged here at the 19th Clinical Convention of the American Medical Association.

Calling on the states to build "strong, efficient local health departments" to cope with alcoholism, Dr. Ralph E. Dwork, Pennsylvania Deputy Secretary of Health, declared that the field is currently "dominated by the clinician and the "alcohologist," although, "like geriatrics, alcoholism requires the concerted effort of medicine, public health, mental hygiene, welfare, housing authorities, education, etc., if any effective progress is to come."

Dr. Dwork told a session on alcoholism that current studies have failed to produce reliable morbidity and mortality rates, an acceptable concept of etiology, or even a clear profile of the alcoholic.

The health official said that the answer must be sought not only in studies of the individual alcoholic, but in the nature of the community that he comes from. Neither the number of patients nor the economic losses caused by alcoholism, he said are "the only aspects that make this a public health problem. Its interrelationships with highway accidents, delinquency and crime, use of narcotics, disruption of the family, and elevated suicide rates are other social manifestations," he added.

In arguing for the public health agency as the logical focus for handling the problem, Dr. Dwork asserted that only a multi-disciplined approach, based on a concept of multiple causation and able to use a variety of public health techniques, could cope with a problem as complex as alcoholism. What is needed, at the very outset, he said, is to develop a "workable epidemiology of alcoholism."

"Reliable and valid mortality and morbidity rates are virtually nonexistent," Dr. Dwork charged. "We have had to rely on various parameters of estimation, such as the sale of alcoholic beverages or deaths with underlying cirrhosis. While these have served and are still serving a useful purpose, it is essential for us to develop a greater degree of sophistication."

Similarly, he said, research has developed on a piecemeal basis. "We have bits and pieces of information on alcohol use in Italians, Jews, Chinese, and in the Irish. We have studied the phenomenon in high schools and colleges, in industry and elsewhere. We have, in our efforts to delineate the profile of the alcoholic, subjected both alcoholics and nonalcoholic controls to a barrage of psychologic tests. No clear discernible pattern has emerged—at least, one we can test for.

No Definitive Explanation

"Analytical psychiatric probing," he went on, "has offered various explanations such as latent homosexuality, oral fixation, and self-destruction. None of these has been sufficiently definitive to be really helpful . . . At any rate, there is growing unhappiness with our research efforts in the field of alcoholism. There is growing impatience at its piecemeal approach."

Reprinted from *Medical Tribune,* December 27, 1965.

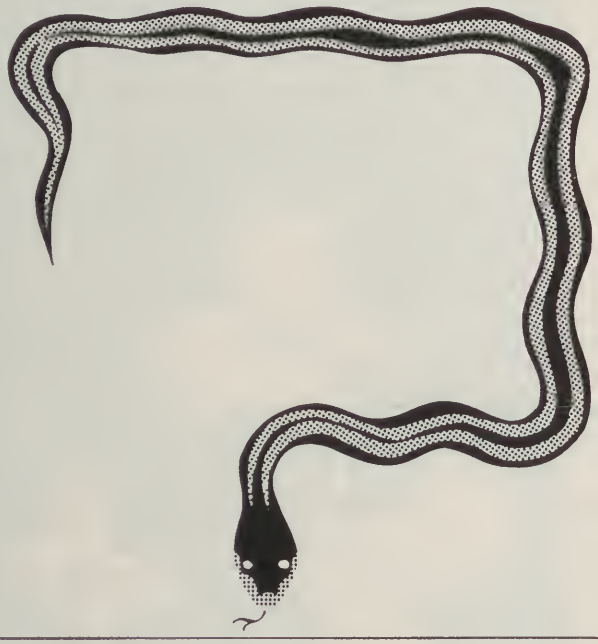
PL 2-2122



Dr. Dwork pointed out that the public health agency could launch newer statistical sampling techniques, examine the longitudinal and long-term aspects of alcoholism, and utilize teams who would be "working together, not just at some laboratory bench, but in the community and natural environment in which our patient is found and exists. Indeed, it may well be that here, too, our patient will be the 'community itself'—not just the alcoholic as an individual."

While arguing for the public health agency, Dr. Dwork asserted that far too many such agencies are still living in "the horse-and-buggy age." "More than one health department in this country is directed by a nonphysician," he declared. "More than one is headed up by a physician who has had no training in public health. Too many of these are refugees from unsuccessful practices or those who are seeking refuge and comfort after a cardiac accident."

In making these points, he called on the profession and on individual physicians to help strengthen the public health agency within the community.

"In 40 of 44 cases of irritable or spastic colon, Cantil [mepenzolate bromide] or Cantil with Phenobarbital reduced or abolished abdominal pain, diarrhea and distention and promoted restoration of normal bowel function . . . Cantil [mepenzolate bromide] proved to be singularly free of anticholinergic side-effects . . . Urinary retention, noted in two cases was eliminated in one by reducing dosage."[1]

CHARMS THE HYPERACTIVE COLON

CANTIL®

(mepenzolate bromide)

helps restore normal motility and tone

IN BRIEF:

One or two tablets three times a day and one or two at bedtime usually provide prompt relief. Cantil with Phenobarbital may be prescribed if sedation is required.

Dryness of the mouth or blurring of vision may occur but it is usually mild and transitory. Urinary retention is rare. Caution should be observed in prostatic hypertrophy—withhold in glaucoma. Cantil with Phenobarbital is contraindicated in patients sensitive to phenobarbital.

Supplied: CANTIL (mepenzolate bromide) —25 mg. per scored tablet. Bottles of 100 and 250. CANTIL with PHENOBARBITAL —containing in each scored tablet 16 mg. phenobarbital (warning: may be habit forming) and 25 mg. mepenzolate bromide. Bottles of 100 and 250.

Maternal Welfare

Instructive case histories submitted by Subcommittee on Maternal Welfare

JOHN WHITRIDGE, JR., MD, chairman

Case 11—Postpartum Hemorrhage

The patient was 37 years old, para 6. She was admitted to the labor floor at 3 PM, August 10, after an uneventful and normal antepartum course. She reported spontaneous rupture of the membranes 15 minutes before admission. Admission physical examination revealed moderate bloody show, the cervix 2 cm dilated and 50% effaced, vertex presenting. Contractions were occurring every three minutes, blood pressure was 130/90, pulse rate was 80 per minute and regular, and temperature was normal.

She was complaining bitterly of severe back pain and 30 minutes after admission received 1½gr seconal by mouth, and 5mgm Trilafon intramuscularly. She continued to complain of abdominal and back discomfort and became all but unmanageable. At 5 PM she was given 100mgm Demerol and .4mgm Scopolamine. The cervix was 4cm dilated.

At 5:30 dilatation was 8cm, and the patient was taken to the delivery room. Saddle block anesthesia with Xylocaine was administered at 5:50 PM. At this time the fetal heart rate was noted to have slowed to 80 per minute and was somewhat irregular, and oxygen was administered by mask. At 6 PM, after performance of central episiotomy, she was delivered by low forceps of a full-term living boy.

The placenta was expressed easily soon afterward. No lacerations were found in the uterus, cervix, and vagina. One ampoule of Syntocin was administered intravenously and one ampoule of Methergine intramuscularly. A vaginal pack was inserted. Routine repair of the episiotomy was completed at 6:20 PM. Some bleeding through the vaginal pack was noted, and an additional ampoule of Syntocin was given intramuscularly.

Upon completion of the episiotomy repair, the vaginal pack was removed and excessive, heavy, bright red bleeding was noted. Intravenous 5% dextrose in 0.2% saline had already been begun, and two ampoules of Pitocin were added to the intravenous fluids.

At 6:40 PM, blood was drawn and sent to the laboratory for typing and cross-matching. The report indicated the hemoglobin to be 12.2gm and hematocrit 37%. At this time the blood pressure was 115/80, pulse rate 96, and the patient continued to bleed. At 7:15 the blood pressure had fallen to 80/60 and the patient became unmanageable, making it difficult to maintain the administration of intravenous fluids. The first unit of blood was received from the blood bank at 8:10 PM but could not be started until 8:30 because of the patient's unmanageable behavior. Ultimately a cut-down was accomplished, and one unit of whole blood was administered by pump. The patient, however, was pronounced dead at 8:45 PM.

Permission for autopsy was obtained. No lacerations or perforations of the uterus or birth canal were found, nor was there any retained placental tissue. The cause of death is listed as postpartum hemorrhage due to uterine atony.

Comment

The committee voted that this death was preventable on the basis of delay in the administration of blood. The total elapsed time

DACTILASE®

Each tablet contains:
Dactil® (piperidolate hydrochloride), 50 mg.;
Standardized cellulolytic* enzyme, 2 mg.;
Standardized amylolytic enzyme, 15 mg.;
Standardized proteolytic enzyme, 10 mg.;
Pancreatin 3X** (source of lipolytic activity), 100 mg.; Taurocholic acid, 15 mg.

*Need in human nutrition not established.
**As acid resistant granules equivalent in activity to 300 mg. Pancreatin N.F.

In chronic or acute indigestion, fluttery, gassy stomachs obtain prompt, gratifying relief through the antispasmodic, surface anesthetic and enzymatic activity of Dactilase. Dactilase decreases hypermotility and pain and reduces the production of gas. Dactilase does not induce stasis, but helps restore normal tone. It has little or no effect on enzyme secretions, but *adds* enzymes, thus contributing to the digestive efficiency of the patient.

Side Effects and Contraindications: Dactilase is almost entirely free of side effects. However, it should be withheld in glaucoma and in jaundice due to complete biliary obstruction.

Administration and Dosage: One tablet with, or immediately following, each meal. Tablets should be swallowed whole.

Supplied: Bottles of 60 and 250.

between delivery and death was two hours and 45 minutes. An essential part of any modern obstetric service is that of providing prompt and massive blood replacement in cases of unusual blood loss. Had one or two units of Group O, Rh negative blood been immediately available and administered promptly while routine cross-matching was being performed, the committee members believed that the outcome of this case would have been different.

For cold hands and feet, nothing beats hot stoves—but they *are* awkward to carry around. Now Gerilid, in good-tasting take-along chewable tablets can provide rapid vasodilation of peripheral circulation, bringing real warmth to the extremities and decreasing sensitivity to sudden temperature change. Patients *like* Gerilid and *know* they are getting relief.

GERILID™

Each chewable tablet contains: nicotinic acid (niacin) 75 mg. and aminoacetic acid (glycine) 750 mg.

Administration and Dosage: One or two chewable tablets 3 times a day before meals. If flushing is objectionable, dosage may be lowered. However, tolerance to flushing usually develops without loss of efficacy in regard to vasodilation. The recommended dosage should not be exceeded.

Side effects: Occasional lightheadedness or transient itching which may disappear with continued use. There are no known contraindications; however, caution is advised when there is a concomitant administration of a coronary vasodilator.

Supplied: Packages of 50 chewable tablets.

Also available in liquid form as Geriliquid®, in bottles of 8 and 16 ounces.

RAY HEPNER, M.D., Editor

PHYSICAL ACTIVITIES FOR SCHOOL CHILDREN WITH HEART DISEASE

MILTON MARKOWITZ, MD
CATHERINE A. NEILL, MD

Physicians are often asked to advise parents on the amount and kind of physical activity for children with heart disease. When a cardiac child is symptomatic, the answer is easy: the patient is told to avoid, insofar as is possible, those exertions which cause symptoms. But most children with heart disease are asymptomatic, and the physician finds it difficult to determine the amount of permissible physical activity.

Often when the physician is uncertain or when he is confronted by anxious parents, he excludes the child entirely from physical education, regardless of the nature of the cardiac lesion. School nurses and physical educators are also wary of allowing patients with any kind of heart disease to exercise. Often the school medical report is not explicit, and restrictions which may have been intended for a limited period only are carried on for many years. Consequently, many asymptomatic patients are needlessly restricted in their school and extracurricular activities.

Many other children with loud functional or questionably organic murmurs are often restricted from a full program of normal activities. Some of these children become increasingly concerned over their health and become cardiac-conscious, neurotic adults. Others, recognizing that they can do more than their medical advisors appreciate, are frustrated by sitting on the sidelines. They exercise with even greater vigor outside of school and give considerable concern to their parents.

Most pediatric cardiologists agree that most children with heart disease are able to participate in physical education with few restrictions. This report discusses the indications for limiting physical exercise for childhood cardiac conditions.

From the Harriet Lane Home Cardiac Clinic, the Children's Medical and Surgical Center, Johns Hopkins Hospital, and the Departments of Pediatrics, Sinai Hospital of Baltimore and the Johns Hopkins School of Medicine.

Rheumatic Fever and Rheumatic Heart Disease

In the past, children were arbitrarily restricted from strenuous physical activity for at least one year after an attack of rheumatic fever, regardless of its severity. This practice may have been wise when severe attacks of rheumatic carditis were the rule rather than the exception; but there has been a sharp decline in the severity of rheumatic fever, especially in the number of damaging recurrent attacks, making the above dictum obsolete. The physician's recommendations should be based on the severity of the attack and the extent of residual heart disease.

No Valvular Disease.—Approximately 40% of patients with rheumatic fever today have either polyarthritis or chorea as their only major manifestation. The illness usually runs its course within three months. If at the end of this period there is no evidence of cardiac involvement, there is no need for any physical restriction. The

Obstetrical or post—surgical patients requiring a dependable increase in hemoglobin will receive as much iron (250 mg. in a 5 cc. ampul) as in one pint of blood. Imferon (iron dextran injection) is less expensive and it avoids the well-recognized hazards of whole blood transfusion. When patients cannot—or cannot be relied upon to—take oral iron, Imferon (iron dextran injection) will rapidly supply needed iron for reserve stores.

IMFERON®
(iron dextran injection)

IN BRIEF: ACTION AND USES: A single dose of Imferon (iron dextran injection) will measurably begin to raise hemoglobin and a complete course of therapy will effectively rebuild iron reserves. The drug is indicated only for specifically-diagnosed cases of iron deficiency anemia and then only when oral administration of iron is ineffective or impractical. Such iron deficiency may include: patients in the last trimester of pregnancy; patients with gastrointestinal disease or those recovering from gastrointestinal surgery; patients with chronic bleeding with continual and extensive iron losses not rapidly replenishable with oral iron; patients intolerant of blood transfusion as a *source of iron;* infants with hypochromic anemia; patients who cannot be relied upon to take oral iron.

COMPOSITION: Imferon (iron dextran injection) is a well-tolerated solution of iron dextran complex providing an equivalent of 50 mg. in each cc. The solution contains 0.9% sodium chloride and has a pH of 5.2-6.0. The 10 cc. vial contains 0.5% phenol as a preservative.

ADMINISTRATION AND DOSAGE: Dosage, based upon body weight and Gm. Hb./100 cc. of blood, ranges from 0.5 cc. in infants to 5.0 cc. in adults, daily, every other day, or weekly. The total iron requirement for the individual patient is readily obtainable from the dosage chart in the package insert. Deep intramuscular injection in the upper outer quadrant of the buttock, using a Z-track technique, (with displacement of the skin laterally prior to injection), insures absorption and will help avoid staining of the skin. A 2-inch needle is recommended for the adult of average size.

SIDE EFFECTS: Local and systemic side effects are few. Staining of the skin may occur. Excessive dosage, beyond the calculated need, may cause hemosiderosis. Although allergic or anaphylactoid reactions are not common, occasional severe reactions have been observed, including three fatal reactions which may have been due to Imferon (iron dextran injection). Urticaria, arthralgia, lymphadenopathy, nausea, headache and fever have occasionally been reported. Initial test doses of 0.5 cc. are advisable.

PRECAUTIONS: If sensitivity to test doses is manifested, the drug should not be given. Imferon (iron dextran injection) must be administered by deep intramuscular injection only. Inject only in the upper outer quadrant of the buttock, not in the arm or other exposed area.

CONTRAINDICATIONS: Imferon (iron dextran injection) is contraindicated in patients sensitive to iron dextran complex. Since its use is intended for the treatment of iron deficiency anemia only it is contraindicated in other anemias.

CARCINOGENICITY POTENTIAL: Using relatively massive doses, Imferon (iron dextran injection) has been shown to produce sarcoma in rats, mice and rabbits and possibly in hamsters, but not in guinea pigs. The risk of carcinogenesis, if any in man, following recommended therapy with Imferon (iron dextran injection) appears to be extremely small.

SUPPLIED: 2 cc. ampuls, boxes of 10; 5 cc. ampuls, boxes of 4; 10 cc. multiple dose vials.

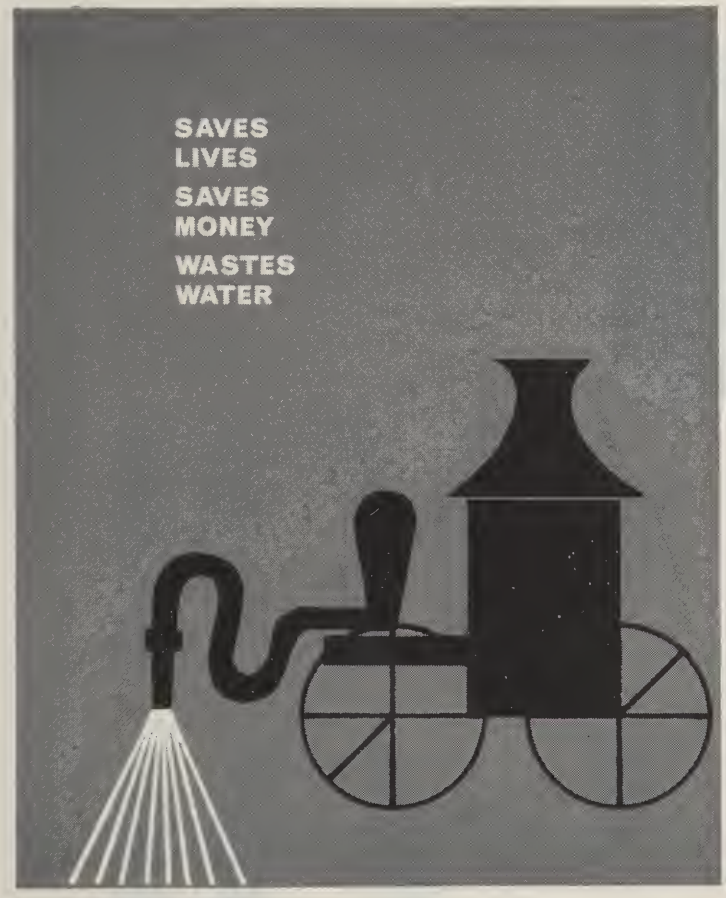
physician must emphasize to the parents that the child has no heart disease, yet he must stress the need to prevent recurrences. He must emphasize in his medical report to the school that the child is free of heart disease and that no restrictions in physical exercise are justified. School physicians and nurses sometimes still indiscriminately restrict all patients with a history of rheumatic fever.

Valvular Disease Without Enlargement.—Patients who are left with valvular damage with no or minimal cardiac enlargement are almost invariably asymptomatic and in general have an excellent prognosis. Nevertheless, the physician often needlessly restricts them from all competitive sports and other strenuous activities. The most common valvular lesion is mitral regurgitation. In approximately 25% of these patients, who remain free of recurrent attacks of rheumatic fever, the murmur disappears within five years. The murmurs of aortic regurgitation are more likely to persist; however, there is no evidence that restriction of physical activity improves the prognosis in patients with either mitral or aortic regurgitation. As long as these children are under medical supervision and follow the prophylactic regimen, restriction of physical activity is not necessary. During the first year after an attack, they should be examined at three-month intervals to make sure that cardiomegaly has not developed.

Valvular Disease With Enlargement.—Patients with a severe single episode of rheumatic fever or after recurrent attacks often have residual valvular disease with some degree of persistent cardiac enlargement. When the myocarditis has subsided and the cardiac findings have stabilized, most of these children tolerate ordinary physical activity quite well. They should be encouraged to participate in regular physical education classes, avoiding those activities that are known to produce symptoms. Strenuous competitive sports should be excluded, especially for adolescent boys, who are particularly prone to continue team activities despite discomfort rather than admit their disability.

Congenital Heart Disease



From the practical point of view, congenital cardiac lesions can be divided into (I) a hemodynamically minor group not requiring surgery, (II) a moderate group which may at some time require surgery, (III) a severe but potentially operable group, and (IV) an inoperable group. This type of classification is more important to the patient than the specific anatomic diagnosis.

Group I includes small left-to-right shunts, whether ventricular or atrial, mild degrees of aortic or pulmonic stenosis, coarctation of the aorta, and all lesions in which the x-ray and electrocardiogram is normal and the only evidence of heart disease is a murmur. ALL THIS GROUP SHOULD BE ALLOWED ABSOLUTELY NORMAL SCHOOL ACTIVITIES, including FULL participation in all the usual sports. We used to advise these children not to take part in competitive sports, but we now believe that such restrictions cause unnecessary confusion and distress. The only precaution is to advise the parents when the child is about 8 or 9, that he is unlikely ever to be eligible for a professional career in sports. Though only a small number of normal males ever actually embark on such a career, many boys may dream of it, and most parents can accept this philosophically.

Group II.—Many of these children with operable lesions have surgery about 5 or 6 years of age and, on entering school, are able to take part in all normal activities. The child who has had a patent ductus ligated or a ventricular or atrial defect satisfactorily repaired should be treated as a normal child. If he is awaiting repair of his defect or a decision regarding surgery has not been reached, we usually allow full activity if the child has little or no cardiac enlargement. If cardiac enlargement or symptoms are present, he should be excused from strenuous competition, racing, etc., but allowed to play games with his friends.

Group III includes all cyanotic patients with operable lesions and all severe cases of pulmonic or aortic stenosis. Usually, if restriction is indicated and the lesion is readily operable with low risk, it is better to undertake surgery and allow the child to return to full activity about six months postoperatively. In some cyanotic children it is safer to defer surgery.

These patients require careful individual consideration. Often the parents can discuss frankly with the school the fact that the child has a defect and request that he be allowed to take part in gym but be excused if he becomes unduly

METAHYDRIN (trichlormethiazide) is prescribed by physicians because it not only approximates the diuretic efficacy of parenteral meralluride injection . . . but, *it is the least expensive of all "brand-name" thiazides*. Therefore, when you prescribe METAHYDRIN (trichlormethiazide) your patients receive the thiazide diuretic that removes a little more salt and water than earlier thiazides, with relatively less loss of potassium . . . and, it's therapy they can more easily afford . . . *only pennies a day*.

METAHYDRIN®

(trichlormethiazide)

oral diuretic

Dosage: One 2 or 4 mg. tablet once or twice daily.

Precautions: As with all effective diuretics, vigorous therapy may produce electrolyte depletion. Patients with severely reduced renal function should be observed carefully since thiazides may be contraindicated. Care should be taken with patients predisposed to diabetes or gout. Patients with a tendency to potassium deficiency, as in hepatic cirrhosis or diarrheal syndromes, or those under therapy with digitalis, ACTH, or certain adrenal steroids, also should be watched carefully.

Side Effects: Nausea, flushing, constipation, skin rash, muscle cramps and gastric discomfort have occasionally been noted; rarely thrombocytopenia and bone marrow depression, photosensitivity, cholestatic jaundice, pancreatitis, perimacular edema, gout and diabetes have been caused by the administration of thiazides.

Contraindications: Complete renal shutdown; rising azotemia or development of hyperkalemia or acidosis in severe renal disease; demonstrated hypersensitivity.

How Supplied: Bottles of 100 and 1000 tablets.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

EVERY DAY

tired or cyanotic. Some sympathetic and cooperative teachers go to extraordinary extremes to include such a child as part of the group in physical education without overstressing him. Others will make no exceptions, and there is no alternative to withdrawing the child completely from all forms of physical education. A new teacher, a new school, or improvement in the child's condition may allow re-evaluation.

For this severe group, all racing in competition should be forbidden, and the child should not play on school teams. This is briefly expressed as *avoidance of competitive sports.* On the whole, the child should not be restricted any more than is clearly common sense for his particular lesion; for example, if he can only walk two blocks before being dyspneic, organized running activities are clearly impossible; but he may derive pleasure from swinging a baseball bat and letting a friend run for him. Dancing should never be forbidden, although the child will have to learn his own limitations.

Group IV.—This inoperable group includes patients with congenital heart disease causing great cardiac enlargement, severe complex cyanotic malformations, severe pulmonary hypertension, and obscure myocardiopathies. Most of these children should be restored to optimal physical condition, preferably in hospital, by use of digitalis and diuretics. A small minority, mostly those with additional noncardiac defects, should be in schools for the handicapped; but as a rule, we deplore these schools for such children and, whenever possible, allow them to remain in ordinary school, if necessary with elevator passes so they do not need to climb stairs. Although formal physical education is usually impossible for this group, they can be taught to do isometric exercises. They should also be encouraged to develop hobbies which do not involve a great deal of physical exertion.

SUMMARY

Children who recover completely from an attack of rheumatic fever or who have mild congenital or rheumatic heart disease should not be restricted in any school or outside activities.

Asymptomatic patients with cardiac disease associated with definite cardiomegaly should be restricted from strenuous or competitive sports but should be allowed to participate in all physical education activities which do not cause excessive fatigue.

Severely affected cardiac children should be encouraged to develop skills in appropriate hobby activities, preferably involving other noncardiac children with similar interests.

Physicians who care for children with heart disease but do not follow these patients into late adolescent and adult life often do not realize the emotional problems which can be created by unnecessary restrictions imposed on the child during his early years.

Gentlemen: Without obligation MAIL me free color brochure and full information.

NAME _____

Metatensin lowers blood pressure and keeps it low—effectively and economically. It combines reserpine with trichlormethiazide which affords more potent saluresis with less loss of potassium than from earlier thiazides. Reserpine contributes antihypertensive effect by relieving anxiety and tension. Metatensin is well-tolerated over long periods; with its effectiveness and economy it assures antihypertensive therapy you and your patients can stay with.

METATENSIN®

Each scored tablet contains:
METAHYDRIN® (trichlormethiazide)
2 mg. or 4 mg. and
Reserpine 0.1 mg.

Usual adult dose: One tablet twice daily. **Precautions and side effects:** Patients with hepatic cirrhosis or diarrheal syndromes, or under therapy with digitalis, ACTH, or potassium-losing steroids, should be observed for signs of hypokalemia. With thiazides, electrolyte depletion, diabetes, gout, granulopenia, nausea, pancreatitis, cholestatic jaundice, flushing, mild muscle cramps, constipation, photosensitivity, acute myopia, perimacular edema, paresthesias, neonatal bone marrow depression in infants of mothers who received thiazides during pregnancy, skin rash or purpura with or without thrombocytopenia, may occur. With reserpine, untoward effects may include depression, peptic ulcer and bronchial asthma. Withdraw medication at least 7 days prior to electroshock therapy, 2 weeks prior to elective surgery.

Contraindications: Complete renal shutdown, rising azotemia or development of hyperkalemia or acidosis in severe renal disease.

Supplied: Metatensin tablets, 2 mg., 4 mg.—bottles of 100 and 1000.

RETARDED CHILDREN CAN BE HELPED

MARYLAND ASSOCIATION FOR RETARDED CHILDREN, INC.

1514 Reisterstown Road Baltimore, Maryland, 21208 486-8168

President
Mr. Robert L. Parrish

Executive Director
Morris Scherr

Editor
Dick M. Hoover

FROM TB TO MR

Judith Schiff Pearl
Supervisor of Women's Activities,
Henryton State Hospital

For the first 39 years of its existence, Henryton State Hospital functioned as a TB treatment center under the jurisdiction of the Department of Health.

Three years ago, Henryton ceased operating as a TB hospital and began admitting "trainable" mentally retarded adults. On July 1, 1963, responsibility was transferred to the Department of Mental Hygiene. This necessitated an entirely new program at Henryton.

A day-care program for 28 retardates, all male, was begun in 1962. Criteria for their admission was: 1) continence, 2) ambulation, 3) ability to follow simple directions, 4) absence of severe behavior problems.

With its quota of 403 mentally retarded adults, the program's guiding principle is that full-time, planned activity and small-group therapy would enable residents to receive the individual training to develop latent abilities and to teach them socially acceptable behavior.

At the start we were able to place residents in groups of seven. Home economics, woodshop, arts and crafts, music, recreation, and work activity classes were scheduled for all groups. Emphasis was placed on self-reliance and neatness. Progress was rapid with individual supervision, and within a short time one-third of the residents were placed in foster care. Extended and short-term home visits were encouraged for the others.

Self-care and good personal habits are encouraged and developed by allowing the resident to perform such basic functions as self-cleanliness and the cultivation of good manners.

Pre-vocational training is offered to those who have demonstrated an aptitude. It stresses the development of manual dexterity and coordination necessary to perform a job, and it emphasizes good job habits. Actual job training is available through job placement within the hospital and on a day-placement basis in the community.

The program is planned to permit a normal, well-rounded development in as many different areas as possible.

Personal habits is an activity designed to emphasize various aspects of personal hygiene, good grooming, and good manners.

Motivation is an activity similar in concept to personal habits.

Games and reading stresses good leisure time habits.

In *woodshop* residents are taught proper care and use of tools.

Home economics teaches female residents the use and care of all domestic utensils, the planning and preparation of meals, and the repairing and sewing of clothing.

Arts and crafts stresses the use and care of a variety of tools and equipment, the development of handskills and coordination.

Outside activities are provided to allow for the expression of individual and group differences.

Religious activities are regularly scheduled. These services are conducted by clergymen of several faiths.

Adult education is scheduled for all residents who demonstrate reading ability. Such residents attend reading classes one hour per day.

From Maryland Steps Ahead, September, 1965 (a Department of Mental Hygiene publication).

when the feeling of guilt overwhelms

NORPRAMIN®

(desipramine hydrochloride)

non-sedating · rapid-acting
ANTIDEPRESSANT

overcomes guilt, lifts depression, restores confidence

Feelings of guilt, worthlessness, emptiness and loss frequently characterize depression. Such feelings, along with insomnia, physical complaints, sadness, apprehension, and other symptoms of depression rapidly respond to Norpramin (desipramine hydrochloride). Improvement often begins in 2-5 days, sometimes in less. A few patients, sensitive to central nervous system stimulants may become restless as depression is lifted—in such cases dosage may be reduced or a tranquilizer added.

Indications: In depression of any kind—neurotic and psychotic depressive reactions; manic-depressive or involutional psychotic reactions. **Dosage:** Optimal results are obtained at a dosage of two 25 mg. tablets t.i.d. (150 mg./day). **Contraindications and Precautions:** Glaucoma, urethral or ureteral spasm, recent myocardial infarction, severe coronary heart disease and epilepsy. Should not be given within two weeks of treatment with a monoamine oxidase inhibitor. Safety in human pregnancy has not been established. **Adverse Effects:** Side effects, usually mild may include: dry mouth, constipation, dizziness, palpitation, delayed urination, "bad taste," sensory illusion, tinnitus, agitation and stimulation, sweating, drowsiness, headache, orthostatic hypotension, flushing, nausea, cramps, weakness, blurred vision and mydriasis, rash, allergy, transient eosinophilia, granulopenia, altered liver function, ataxia and extrapyramidal signs. **Supplied:** Norpramin (desipramine hydrochloride) tablets of 25 mg., in bottles of 50, 500 and 1000.

DEPARTMENT OF HEALTH

STATE OF MARYLAND

William J. Peeples, MD, MPH, *Commissioner*

Highlights

VIROLOGY LABORATORY REVIEWED

As part of a continuing effort to develop and maintain competent laboratory services, a survey of the activities of the Division of Virology was requested by the Department's Bureau of Laboratories. A specialist from the USPHS Communicable Disease Center (CDC) reviewed technical procedures, facilities, and educational and professional qualifications of personnel. The evaluation specimens previously distributed by the CDC were used to determine the level of competence of personnel. The CDC specialist was favorably impressed with the scope of activities in this field and with the competence and dedication of the personnel in the Virology Division.

NEW EARLY VIROLOGIC TEST FOR ENCEPHALITIS

Prompted by recent information from outbreaks of encephalitis in the United States in the past two years, the Bureau of Laboratories has replaced the complement fixation test to detect arbovirus encephalitis with a new serologic procedure to detect a different kind of antibody which appears in the patient's blood from the day of onset. It is now possible for the laboratory to provide an early alert of arbovirus activity in the state.

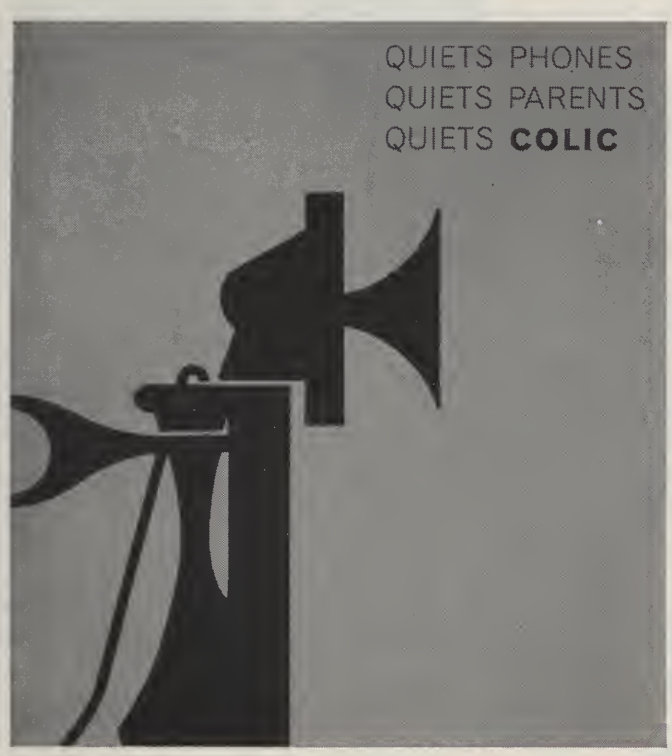
METROPOLITAN AREA AIR QUALITY SURVEY

The Anne Arundel County Health Department has put into operation, in Glen Burnie, the first station for the Metropolitan Baltimore Air Quality Survey. Being conducted by the State, Baltimore City, Baltimore County, and Anne Arundel County health departments, the survey is part of a three-year study under a grant of approximately $1,000,000. The grant provides $3 in federal money for each $1 from the participants in the study.

PROVISIONAL VITAL STATISTICS—1965

Maryland's birth rate in 1965 dropped approximately 8% below the 1964 rate to 20.9 per thousand population, according to provisional statistics compiled by the State Health Department. Declines were registered by every county and Baltimore City. During 1965, 74,000 children were born to Maryland residents, approximately 5,000 fewer than in 1964. This is the lowest number since 1956 and is typical of the national trend.

The death rate increased about 1% over 1964's record low, with 8.6 deaths per thousand population in 1965. The provisional figure was 30,671 deaths, approximately 1,000 more than in 1964.



Heart disease, cancer, and stroke still lead as death causes in Maryland; death rates from each rose slightly in 1965. Greatest increase in death rates occurred as the result of influenza and pneumonia, motor vehicle accidents, and cirrhosis of the liver.

More information is available from the State Health Department's Division of Statistical Research and Records.

OBSTETRICAL CONSULTANT APPOINTED

King B. E. Seegar, Jr., MD, was appointed obstetrical consultant in the Bureau of Preventive Medi-

In colicky infants Pediatric Piptal with Phenobarbital slows down spasm, diminishes pain and crying and improves feeding patterns. It permits sleep and rest for patient and family. The less than hypnotic amount of phenobarbital in the recommended dose affords a mild, calming action and enhances the antispasmodic action of Piptal (pipenzolate bromide). The latter drug, as reported in the medical literature, has a favorable ratio of effectiveness to side-effects which is unusual in anticholinergics and thus is particularly appropriate to pediatric use.

PEDIATRIC PIPTAL® WITH PHENOBARBITAL

each cc. contains 6 mg. phenobarbital (warning: may be habit forming); 4 mg. Piptal® (pipenzolate bromide), and 20% alcohol.

Pleasant-tasting Pediatric Piptal with Phenobarbital is miscible in milk, formulas and fruit juices, and may also be given by dropper directly on the infant's tongue. Dosage is 0.5 cc. 15 minutes before feeding; in severe cases, 1.0 cc. four times daily. High doses may occasionally cause constipation with tenesmus and, rarely, flushing without fever. It is contraindicated in bowel obstruction or sensitivity to phenobarbital or anticholinergics. Available in 30 cc. dropper bottles, droppers calibrated to deliver 0.5 cc.

cine. He has served part-time for the past year and a half as a consultant in the Department's maternal and child health program.

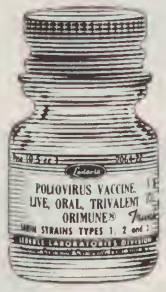
Upon request, Dr. Seegar offers consultation and assistance to local health officers and physicians in developing and improving obstetrical and family planning clinics. He has been cooperating with local health departments and community organizations, adapting his services to the particular needs of each community, as part of the Department's concerted effort to provide better prenatal and postnatal care for mothers who cannot afford private physicians. Information and guidance on family planning also are offered.

Dr. Seegar is a graduate of the University of Maryland School of Medicine, is certified by the American Board of Obstetrics and Gynecology, and has engaged in the private practice of obstetrics and gynecology for 20 years. He is assistant professor in obstetrics and gynecology at the University of Maryland and an instructor at the Johns Hopkins University School of Medicine. He is a former chief of obstetrics at both South Baltimore General Hospital and Church Home and Hospital.

"All Interns are Alike"

It stands to reason. They all go through the same training; they all have to pass the same tests; they all have to measure up to the same standards; they all are underpaid, too. Therefore, all interns are alike.

That's utter nonsense, of course. But it's no more nonsensical than what some people say about aspirin. Namely: since all aspirin is at least supposed to come up to certain required standards, then all aspirin tablets must be alike.

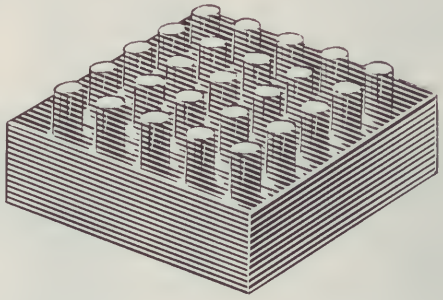


Bayer's standards are far more demanding. In fact, there are at least *nine specific differences* involving purity, potency and speed of tablet disintegration. These Bayer® standards result in significant product benefits including gentleness to the stomach, and product stability that enables Bayer tablets to *stay* strong and gentle until they are taken.

So next time you hear someone say that all aspirin tablets are alike, you can say, with confidence, that it just isn't so.

You might also say that all interns aren't alike, either.

Doctor...two important Lederle products for routine office procedures



single-dose vials for convenient and economical polio immunization

ORIMUNE®
POLIOVIRUS VACCINE, LIVE, ORAL
TRIVALENT
SABIN STRAINS, TYPES 1, 2 and 3

Fast, simple administration—and economy for the patient — make the new 0.5 cc single-dose vial of ORIMUNE Trivalent ideal for private practice. (Packaged 5 to a box with 5 sterilized disposable droppers for your convenience).
(Also available in 2 cc and 2 drop dosage forms).
Only 2 doses required for complete, initial immunization for patients more than a year old.

Effectiveness—may be expected to confer active immunity against all three types of poliovirus infection in at least ninety percent of susceptibles only if given at full dosage, as directed. No characteristic side effects have been reported. There are, however, certain contraindications. These are, broadly: acute illness, conditions which may adversely affect immune response, and advanced debilitated states. In these, vaccination should be postponed until after recovery.
In infants vaccination should not be commenced before the sixth week of life. Do not give to patients with viral disease, or if there is persistent diarrhea or vomiting. ORIMUNE and live virus measles vaccine should be given separately.
Dosage—initial immunization: two doses each given orally at least 8 weeks apart. (Give a third dose to infants at 10-12 months). Booster immunization: one dose, given orally. See package literature for full directions.

simplifies routine screening

TUBERCULIN, TINE TEST
(Rosenthal) Lederle

Swab · Uncap · Press · Discard

Comparable in accuracy and reliability to older standard intradermal tests*, but faster and easier to use. Since TINE TEST is relatively painless it should receive greater patient acceptance. Results are read at 48-72 hours. The self-contained, completely disposable unit requires no refrigeration and is stable for two years.
Side effects are possible but rare: vesiculation, ulceration or necrosis at test site. Contraindications, none; but use with caution in active tuberculosis. Available in boxes of 5 (new individually-capped unit); cartons of 25.

Dental Health in Baltimore

Dr. H. Berton McCauley, director of the Bureau of Dental Care, reports that the dental health of the people of Baltimore, though far from perfect, is vastly improved over that of a decade ago. The improvement is the outcome of the continuous program of fluoridation of the public water supply.

Inaugurated by the Bureau of Water Supply on November 26, 1952, the fluoridation program has reduced tooth decay in resident Baltimore children by about 60% through age 11, 50% through age 13, and 30% through age 15. This represents about half a million fewer cavities in the teeth of the city's children and another 200,000 fewer in those of the surrounding counties. The economic advantage to parents in the metropolitan area served by the water system is conservatively valued at $3.5 million in dentists' bills alone. The benefits in improved teeth, health, and appearance are incalculable, yet the cost of fluoridating Baltimore's public water supply is only about $100,000 a year.

Recent evidence of the effectiveness of fluoridation was derived from a study of dental findings in 437 Head Start children in East Baltimore last summer. More than 50% of these underprivileged youngsters were entirely free of tooth decay, compared with 20-25% in random groups of Baltimore children of the same age in 1951.

A further indication of fluoridation's beneficial effects is that 17% of 2,385 prospective mothers who sought help in the Baltimore Maternity Center during the last six months of 1965 did not need dental care. As a rule, nearly all adults in similar circumstances need dental care.

STATE OF MARYLAND

Department of Mental Hygiene

Isadore Tuerk, MD, Commissioner

Kurt Gorwitz, Statistics Director

The Mental Health of the Negro

Maryland's nonwhite admission rates to psychiatric facilities are significantly higher than comparable white rates. The table, based on data from the Maryland Psychiatric Case Register, shows admission rates (per 100,000 estimated population) for the 1964 fiscal year by race, sex, and type of facility. These figures are consistent with comparable rates for 1963.

Type of Facility	WHITE			NONWHITE		
	Total	Male	Female	Total	Male	Female
DMH hospitals	199.9	246.8	153.8	373.9	487.3	263.6
Other public hospitals	62.0	69.8	54.3	46.0	70.3	22.3
Private hospitals	112.8	84.6	140.5	3.8	3.9	3.8
Total hospitals	374.7	401.2	348.7	423.7	561.5	289.7
Outpatient facilities	350.3	375.8	325.2	461.5	463.3	459.8
Total	725.0	777.0	673.9	885.2	1024.8	749.5

During this period, nonwhite admissions to the Department's six psychiatric hospitals were proportionally nearly twice the number of white admissions. This ratio was similar for males and females. Admissions to other hospitals for the treatment of mental illnesses significantly changed this comparison. These facilities reported few nonwhite admissions, particularly to the private hospitals (22 as compared with 3,221 white admissions). Nonwhite admission rates to all hospitals were 13% higher, with male rates 40% higher and female rates 17% lower than comparable white figures. Nonwhite admission rates to all inpatient and outpatient facilities were 32% higher among males and 11% higher among females. It is interesting to speculate as to the factors in the male and female role in the white and nonwhite family and community which produced the above differences. For example, is the lower hospital and the higher clinic rate among nonwhite women related to a more dominant female role in the economic structure of the Negro family?

It should be clear that these figures, and similar data reported from other states, cannot provide any indication as to the relative frequency of mental illnesses among the white and nonwhite population segments, since they pertain only to patients receiving treatment in specified facilities. The number untreated or receiving services through alternative resources, such as private psychiatric practice, is not known.

These data do fortify one important point. The tremendous cost to the community in terms of crime, delinquency, welfare, and other related problems stemming from the Negro's chronic cultural, economic, and social deprivation has been repeatedly pointed out. A number of interrelated factors are believed to be responsible for the greater utilization of psychiatric facilities by the nonwhite community. Among these, the above here also assume a key role.

Kurt Gorwitz

Thanks to Dexamyl®

brand of
dextroamphetamine
sulfate and amobarbital

she can say "No thank you" to the crêpe suzette.

'Dexamyl' does more than most anorectics. Because it curbs appetite *and* lifts mood, 'Dexamyl' can encourage the discouraged dieter to stay on her diet.

The mood lift with 'Dexamyl' can make the difference between the success or failure of her diet plan.

Formulas: Each 'Dexamyl' Spansule® Capsule (brand of sustained release capsule) No. 1 contains 10 mg. of Dexedrine® (brand of dextroamphetamine sulfate) and 1 gr. of amobarbital, derivative of barbituric acid [Warning, may be habit forming]. Each 'Dexamyl' *Spansule* capsule No. 2 contains 15 mg. of Dexedrine (brand of dextroamphetamine sulfate) and 1½ gr. of amobarbital [Warning, may be habit forming].

Principal cautions and side effects: Use with caution in patients hypersensitive to sympathomimetics or barbiturates and in coronary or cardiovascular disease or severe hypertension. Insomnia, excitability and increased motor activity are infrequent and ordinarily mild.

Before prescribing, see SK&F product Prescribing Information.

Check on Your Checking Accounts

WILBURN L. McCLURE, JR.

For most physicians, a checking account, whether it be for his practice, for investments, or for household use, should provide three advantages: 1) a convenient way to pay bills, 2) a simple means to keep track of income and expenditures, and 3) a basis for rapidly verifying income and calculating deductible expenses for his income tax. Unfortunately, the latter two goals are seldom attained.

Whether you, an aide, or your wife handles the checkbook, confusion at the end of the month is probably the rule. No matter how meticulous you try to be, when you begin the job of reconciling your cancelled checks against your checkbook balance and the bank's balance, you generally are hoping: 1) you won't find a cancelled check which you forgot to enter, thus reducing the amount you thought you had as a balance; 2) the bank report will show you have more money in the bank than you thought you had.

The latter rarely happens. The former too often does. Also, in at least one month out of three, your excitement of reconciling to a perfect balance is shattered when you find you're off by some ridiculous figure such as $2.43 or 81 cents.

As for your record of deductible expenses, few doctors realize that the Internal Revenue Service does not always consider a cancelled check as proof of an expenditure. Since the burden of proof for legitimate deductible expenditures always rests with the taxpayer, a receipt with a cancelled check is the best evidence to present if your income tax return is called for an audit. (Since the installation of computers, the IRS is performing more and more audits each year.)

The following simplified checkbook and accounting procedure is recommended for physicians.

1. Obtain the three checks to a page, business-type checkbook from your bank.
2. Make sure you deposit all cash and checks into your practice checking account. Deposit all interest, rents, dividends, and money from the sale of investments into your investment accounts. Try to predetermine a budget for household expenses and make timely deposits.
3. Insist on bills or receipts for disbursements which may be questioned later.
4. Mark all check stubs with adequate information describing in full the purpose for which the check was drawn.
5. When deposits are made, be sure the correct amount is recorded on the checkstub. Tape the copy of the deposit slip to the reverse side of the checkstub for future reference.
6. When writing and numbering a check, place the same number upon the bill or receipt and place this bill in the back of the checkbook temporarily.
7. When the cancelled checks are returned from the bank, attach each check to the appropriate stub with scotch tape. Then, from the back of the checkbook, take the bill or receipt for which the check was written and attach it to the cancelled check.

If these simple steps are carried out, an Inter-

HOW IMPORTANT IS THIS
IN YOUR DIAGNOSES OF SMOOTH MUSCLE SPASM?

PERHAPS VERY IMPORTANT

The sphincter of Oddi is made up primarily of smooth muscle fibers. It permits the gall bladder to fill, regulates the flow of bile and pancreatic enzymes and in dysfunction is a primary cause of Biliary Dyskinesia. The sphincter of Oddi is but one of five major foci of smooth muscle spasm where SPACOLIN® (Alverine citrate) acts directly with rapid onset and long duration. No neurotropic side effects because Spacolin is a musculotropic counter-spasmodic unrelated to atropine or atropine-like drugs. Spacolin is not contraindicated in prostatic hypertrophy.

SPACOLIN® (Alverine citrate)

Each tablet contains: Alverine citrate ..... 120 mg.

INDICATIONS: Smooth muscle spasmolytic for use in spastic colon, spastic conditions of the gastrointestinal tract, biliary dyskinesia, cholecystitis, spasm associated with peptic ulcer,* achalasia, pylorospasm, spasm attendant to diarrhea, spastic conditions of the genitourinary tract attributable to inflammation and calculi, certain primary dysmenorrheas and as an aid in cystoscopic, esophagoscopic and gastroscopic examinations. DOSAGE: One tablet after meals 1 to 3 times daily at discretion of physician. When treating spasm associated with peptic ulcer, achalasia or pylorospasm, administer tablets ½ hour before meals. In dysmenorrhea, one tablet 3 times daily starting at onset of discomfort. PRECAUTION: Caution is recommended when using in hypotensive patients. SIDE EFFECTS: In common with other smooth muscle depressants, Spacolin temporarily lowers blood pressure.

*Antacid and dietary measures are of primary importance in ulcer treatment and should not be neglected.

MARYLAND ASSOCIATION OF MEDICAL ASSISTANTS

Annual Meeting of Maryland Association of Medical Assistants

The Maryland Association of Medical Assistants will hold its annual meeting in the Blue Room of the Sheraton Belvedere in Baltimore on Saturday, April 30. For two days preceding the meeting, members of the group operate a coffee booth for the benefit of the Medical and Chirurgical Faculty of Maryland, whose annual meeting this year is April 28 and 29 at the Alcazar. The health evaluation survey offered to physicians during this meeting is also aided by the medical assistants.

The MAMA Coffee Bar is a popular spot at the Alcazar during the annual meeting of the Medical and Chirurgical Faculty. Coffee and cookies will be served again this year on April 28 and 29.

Program for the April 30 meeting is as follows:

A.M.	
10	Morning registration
10:30-12	Business meeting
P.M.	
12-1	Lunch and afternoon registration
1:15	Welcoming address
1:30-2:15	THE USE OF THE VACUUM EXTRACTOR IN OBSTETRICS Eleanor Scott, M.D., Chief of Obstetrics, Church Home and Hospital
2:15-3:00	CARDIAC PACEMAKERS J. M. Zimmerman, M.D., Chief of Surgery, Director of Medical Education, Church Home and Hospital; Associate Professor of Surgery, Johns Hopkins University

Woman's Auxiliary

April, 1966

MRS. IRVING J. TAYLOR, *Auxiliary Editor*

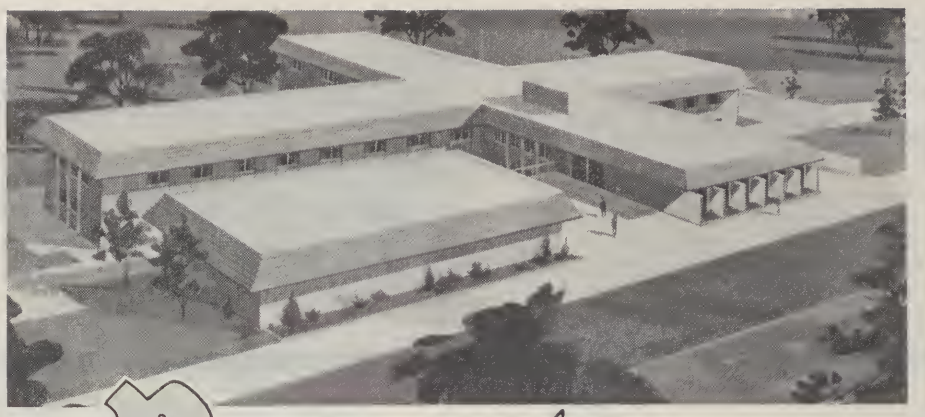
Regional Vice President Will Speak At Auxiliary Luncheon

An honored guest and speaker at our state auxiliary's annual convention will be Mrs. Erle E. Wilkinson, vice president of the Southern Region, Woman's Auxiliary to the American Medical Association.

Mrs. Erle E. Wilkinson

The convention will be held April 27 and 28 at the Holiday Inn Downtown. Mrs. Wilkinson will address the luncheon gathering on the 28th.

Betty Wilkinson is serving her first term as a regional vice president, having completed a three-year term as national chairman of the AMA-ERF Committee.



A resident of Nashville, Tenn, she is a past president of her state auxiliary and is currently its parliamentarian. She has held numerous other posts in her state and county auxiliaries.

Mrs. Wilkinson is a nursing graduate from Vanderbilt University. She has taught Red Cross Home Nursing and Nurse's Aide classes for the Red Cross and is a former instructor in nursing arts and medical nursing at the John Sealy Hospital, Galveston, Tex. Her husband is a pediatrician in Nashville.

President's Message

by ***NORMA M. STROBEL***

This year has been a wonderful experience. The rewards have been far greater than the time and energy required to perform the duties of president.

THE Regent

Nursing & Rehabilitative Treatment Center

operated under the direct supervision of the Lowry Memorial Medical Center.

Offering full treatment to the adult physically handicapped, specialized care to the senior citizen, and convalescent care to post-stroke and post-operative cases. Separate area for cancer patients. *All facilities available to private physician.*

Professionally staffed and equipped Physical Therapy gymnasium, under the direct supervision of a specialist in physical medicine. There is also an organized program of recreation.

Everything at The Regent is designed to be used by wheel chair patients.

8100 Marlboro Pike, Forestville, Maryland

We especially want to welcome the following new members-at-large—all from Anne Arundel County—who have joined the auxiliary recently: Mrs. J. Howard Beard, Gambrills, Mrs. Richard I. Hochman, Annapolis, Mrs. Joseph C. Sheehan, Severna Park, Mrs. Donald C. Smith, Annapolis, Mrs. Willard Smith, Shady Side, and Mrs. William N. Thomas, Severna Park. We hope that they will seriously consider organizing a component auxiliary in Anne Arundel County.

It behooves each doctor's wife to become well informed about the medical world. She should try to learn as much as possible so that she may interpret the information to others. It is important that her friends and her community understand the physician's viewpoint. She is the main liaison between her husband and the world he lives in. She must act as an ambassador in her community to create a realistic picture of medicine as a profession. She must set an example for those with whom she comes in contact concerning such things as the rearing of children and promoting good health habits.

There has been an increasingly negative reaction on the part of the public to the medical profession. Physicians have seemed to be aloof and anti-social in their attitude toward economic change. We must, therefore, have a more positive approach to present problems. Health education and preventive medicine are more important than treatment when it is too late.

Let us all resolve to do our best to correct the image of the physician in the eyes of the general public. Will you accept the challenge?

The Pain Is Gone

Despite introduction of synthetic substitutes, efficacy of 'Empirin' Compound with Codeine remains unchallenged.

n Fractures: B and C vitamins are therapy

tress formula vitamins are a key factor in bone and tissue regeneration. To meet the ncreased metabolic demands, STRESSCAPS offers therapeutic amounts of B and C itamins as an aid to smoother convalescence and earlier rehabilitation. In fractures, s in many other conditions of physiologic stress, STRESSCAPS vitamins are therapy.

Each capsule contains:

Vitamin B_1 (Thiamine Mononitrate)	10 mg.
Vitamin B_2 (Riboflavin)	10 mg.
Niacinamide	100 mg.
Vitamin C (Ascorbic Acid)	300 mg.
Vitamin B_6 (Pyridoxine HCl)	2 mg.
Vitamin B_{12} Crystalline	4 mcgm.
Calcium Pantothenate	20 mg.

Recommended intake: Adults, 1 capsule daily, for the treatment of vitamin deficiencies. Supplied in decorative "reminder" jars of 30 and 100; bottles of 500.

A MEDICO-LEGAL PROBLEM: REFERRING PATIENTS OF ONE DOCTOR TO ANOTHER

The Committee on Medico-Legal Problems has received several complaints from physicians directed against attorneys who have referred patients from one physician to another physician. Lawyers should note that the procedure of a physician accepting a patient already under treatment by another physician is remarkably similar to that of an attorney taking the case of a client already represented by counsel.

While the client/patient has a perfect right to change practitioners the second practitioner is under an obligation to ascertain whether the patient is under treatment and if so, if the first practitioner has released the patient/client.

When a lawyer refers a patient to a second physician, without the consent of the first physician, he interrupts the treatment by the first physician and places the second physician in an unethical position which may result in a censure or other disciplinary action.

Lawyers should be aware of this problem and should be mindful to avoid any advice or action which may contribute to, or result in, unethical conduct on the part of physicians.

THE APPLICATION OF NEUROLEPTANALGESIA IN ANAESTHETIC AND OTHER PRACTICE, edited by N. W. Shephard. Pergamon Press, 1965. $8.50

This is a symposium debating the effectiveness and place of Phenoperidine, Droperidol, and Fentanyl in anesthetic practice today. The debate covers the subject of neuroleptanalgesia, which is a state produced by the combined use of a neuroleptic drug such as Droperidol and an analgesic, for example Phenoperidine. The papers published in this volume will be of interest to all concerned with anesthesia and the surgical and pharmacologic aspects of medicine.

ADVANCES IN OXYTOCIN RESEARCH, edited by J. H. M. Pinkerton. Pergamon Press, 1965. $10

This volume contains the proceedings of a symposium held at the Royal College of Obstetricians and Gynaecologists, London.

Oxytocin was chosen as the subject of this symposium for two reasons: 1) because important work has been done recently on its physiology and pharmacology, and 2) because a new method of administering the drug for the induction of labor in women has become available. It therefore seemed desirable to discuss this new work as a whole. The proceedings published in this volume represent a variety of points of view, and should be of interest to all involved in the study or clinical use of oxytocin: biochemists, physiologists, anatomists, pharmacologists, endrocrinologists, obstetricians, gynecologists, and biologists.

COMPENSATORY ADAPTATIONS, REFLEX ACTIVITY, AND THE BRAIN, by Ezras Asratovich Asratian. Pergamon Press, 1965. $15

This is the first of a series of carefully selected and edited English translations and surveys of Russian contributions in the fields of conditioned reflexes and cerebrovisceral and behavioral physiology. Dr. Asratian, one of Pavlov's outstanding students, summarized the results of nearly twenty years of intensive research on the role of the cerebral cortex in the compensation of disturbed functions of the musculoskeletal system and in regulation of visceral and endocrine functions. He reports the results of extensive experiments designed to explain the many complex mechanisms underlying the development of conditioned reflexes and the adaptation of higher organisms to an ever-changing environment. The book includes a lucid description of direct and reverse or backward conditioning, the results of switching in conditioned reflex activity, and the localization of cortical inhibition in the conditioned reflex arc.

It has been translated by Dr. Samuel A. Corson, a professional bilingual scientist who is directing an active research program in the field of conditioned reflexes and of cerebrovisceral and behavioral physiology. In his

preface, Dr. Corson offers an illuminating summary of the historical and philosophical background of Russian biomedical thinking as exemplified in the theory of nervism or the neurogenic theory of medicine.

This book should be of interest to physiologists, neurologists, psychiatrists, psychologists, and physicians interested in problems of psychosomatic medicine and of restoration of neuromuscular functions. It may be used as a reference in courses in experimental and physiological psychology, neurophysiology, physical medicine and rehabilitation, neurology, and psychiatry.

PEDIATRIC THERAPY, ed 2, edited by Harry C. Shirkey, MD. Mosby, 1966. $18.50

While therapy is the emphasis of this volume, precise diagnosis is stressed throughout, since each is useless without the other. Complete treatment of the child is encouraged: medical, dental, surgical, and psychiatric. Many new chapters appear in this edition, including consideration of pediatric orthopedics, neurosurgery and psychiatric care. The Table of Drug Dosages has been enlarged, thus omitting needless repetition of this information in individual chapters.

GASTROENTEROLOGY, vol 3, ed 2, by Henry L. Bockus, MD, et al. Saunders, 1965. $30

Volume III of this work comprises discussions of gastrointestinal parasites, the liver, biliary tract, and pancreas, and secondary gastrointestinal disorders. The contributors are Dr. Bockus's colleagues and former colleagues at the University of Pennsylvania Graduate School of Medicine.

This entire edition has been rewritten, shifting emphasis where necessary and presenting new techniques and new knowledge of clinical import. Ample use has been made of illustrations to show the many new techniques and procedures.

NEURO-OPHTHALMOLOGY, vol II, edited by J. Lawton Smith, MD. Mosby, 1965. $21.75

This volume presents the material discussed at the second postgraduate symposium on clinical neuro-ophthalmology sponsored by the Department of Ophthalmology, University of Miami School of Medicine. The papers represent the current interest of each of the participants.

HANDBOOK OF PHYSICAL MEDICINE AND REHABILITATION, edited by Frank H. Krusen, MD. Saunders, 1965. $16.50

The American Rehabilitation Foundation, in 1957, established a Medical Advisory Committee to advance the field of physical medicine and rehabilitation and develop adequate teaching programs in the medical schools. This handbook is one of the contributions of this committee. In three parts, it covers evaluation of the patient, techniques of management, and evaluation and management of specific disorders.

SYMPOSIUM ON THE LENS, by John E. Harris, MD, et al. Mosby, 1965. $18.50

The organizers of this symposium, envisaging a publication having the scope of a textbook, asked each participant to review all the knowledge in his particular field. Thus, this volume surveys up-to-date information on the anatomy, biochemistry, physiology, immunology, and other aspects of the normal lens.

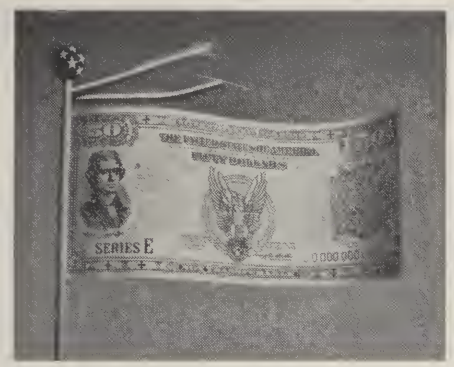
CURRENT SURGICAL MANAGEMENT III, edited by Edwin H. Ellison, MD, Stanley R. Friesen, MD, and John H. Mulholland, MD. Saunders, 1965. $11.50

One hundred and four surgical authorities have contributed their viewpoints on controversial surgical problems. In some instances the viewpoints vary because of fundamental differences; in others, the disagreement concerns the choice of or timing of an operation. The topics selected are those in which acceptable controversy exists and which represent questions which commonly beset a surgeon. While not providing any answers, it shows how certain authorities have arrived at their own solutions.

New drugs take exams, too.



Today, virtually every medical school in the United States cooperates with pharmaceutical manufacturers in the clinical evaluation of new and promising drugs. Just as you might find it significantly more difficult to practice medicine without the useful new compounds made available through original pharmaceutical research in the past twenty years—prescription-drug manufacturers would find it equally difficult to obtain extensive, long-term, dependable evaluations of new therapeutic agents without the close cooperation of medical staffs and clinical facilities of medical schools and teaching hospitals. Such cooperation leads toward more effective care of more patients—the common goal of medical and pharmaceutical research—toward reduction in the cost of disease, toward increase in useful longevity.

This message is brought to you as a courtesy of this publication on behalf of the producers of prescription drugs.

Red, white & blue chip investment

You won't get rich overnight buying U. S. Savings Bonds. But for the long run, they make an excellent investment.

You get a guaranteed rate of interest—3¾% when held to maturity—so there are no ups and downs to worry about.

You also get certain tax advantages since Savings Bonds aren't subject to state or local income taxes and the federal tax can be deferred until the Bonds are cashed.

But probably most important is that Bonds pay off in more than dollars. When you get your Bond investment back, you know it has helped Uncle Sam strengthen the cause of freedom (your cause) all around this troubled world of ours.

Buy U. S. Savings Bonds and own a share of America. It's a good outfit to do business with.

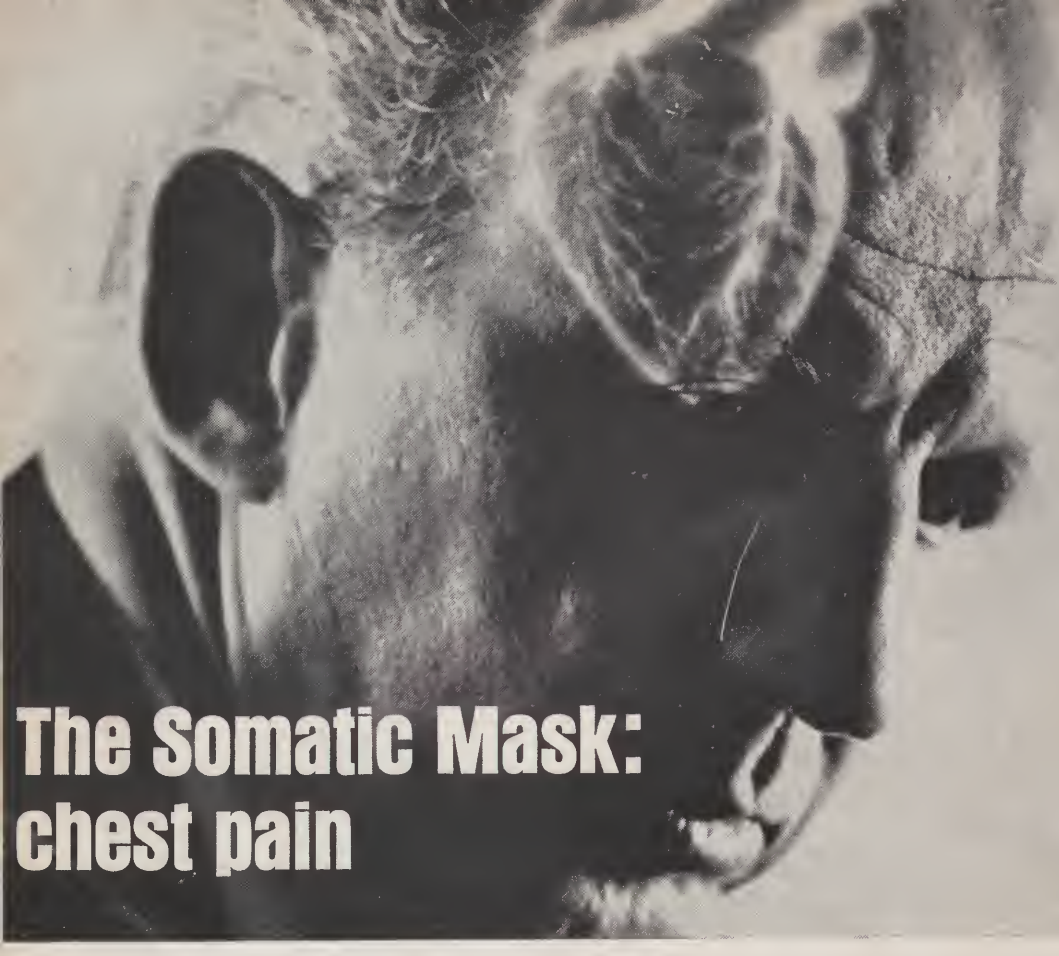
Blood-glucose screening for all your patients?

...because "Abnormalities of glucose metabolism are among the [most common] encountered in clinical practice...."* Simple, quick, economical blood-glucose screening with DEXTROSTIX® Reagent Strips is practicable in every regular physical examination, emergency situation, and whenever hypo- or hyperglycemia may be of clinical significance—for "The precision and accuracy of DEXTROSTIX ...meet the need for an always available simple screening method...."* All that is required for screening with DEXTROSTIX is 60 seconds and a globular drop of capillary or venous blood. Abnormal readings will be a valuable aid to diagnosis; normals will help you establish an important baseline for future reference.

Marks, V., and Dawson, A.: Brit. M. J. 1:293, 1965.

DEXTROSTIX—
provides a clinically useful determination when performed according to directions†



DEXTROSTIX is not intended to replace the more precise analytical laboratory methods.

Yes—all your patients

AMES

The Somatic Mask: chest pain

heart disease or psychic tension?

"Heart symptoms"—chest pain, tachycardia, arrhythmia—invariably alarm and preoccupy the patient, though they may be completely without organic basis. Such symptoms often are somatic masks of psychic tension, arising from constant encounters with stressful situations.

When the problem is diagnosed as emotionally produced, consider Valium (diazepam) as adjunctive therapy. Valium (diazepam) acts rapidly to calm the patient, to reduce his psychic tension and relieve associated cardiovascular complaints.

Neurotic fatigue—the chronic tiredness resulting from emotional strain which so often accompanies psychogenic "heart" symptoms—also can be controlled by this highly useful agent. Valium (diazepam) often achieves results where other psychotherapeutic agents have failed.

Valium (diazepam) is generally well tolerated, and usually does not impair mental acuity or ability to function. If side effects such as ataxia and drowsiness occur, they usually disappear with dosage adjustment.

In prescribing: Dosage—Adults: Mild to moderate psychoneurotic reactions, 2 to 5 mg b.i.d. or t.i.d.; severe psychoneurotic reactions, 5 to 10 mg t.i.d. or q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hrs, then 5 mg t.i.d. or q.i.d. as needed; muscle spasm with cerebral palsy or athetosis, 2 to 10 mg t.i.d. or q.i.d. Geriatric patients: 1 or 2 mg/day initially, increase gradually as needed.

Contraindications: Infants, patients with history of convulsive disorders or glaucoma.

Warning: Not of value in the treatment of psychotic patients, and should not be employed in lieu of appropriate treatment.

Precautions: Limit dosage to smallest effective amount in elderly patients (not more than 1 mg, one or two times daily) to preclude ataxia or oversedation. Advise patients against possibly hazardous procedures until correct maintenance dosage is established; driving during therapy not recommended. In general, concurrent use with other psychotropic agents is not recommended. Warn patients of possible combined effects with alcohol. Safe use in pregnancy not established. Observe usual precautions in impaired renal or hepatic function and in patients who may be suicidal; periodic blood counts and liver function tests advisable in long-term use. Cease therapy gradually.

Side Effects: Side effects (usually dose-related) are fatigue, drowsiness and ataxia. Also reported: mild nausea, dizziness, blurred vision, diplopia, headache, incontinence, slurred speech, tremor and skin rash; paradoxical reactions (excitement, depression, stimulation, sleep disturbances and hallucinations) and changes in EEG patterns. Abrupt cessation after prolonged overdosage may produce withdrawal symptoms similar to those seen with barbiturates, meprobamate and chlordiazepoxide HCl.

Supplied: Tablets, 2 mg, 5 mg and 10 mg; bottles of 50 for convenience and economy in prescribing.

INDICATIONS: Grand mal epilepsy and certain other convulsive states.

PRECAUTIONS: Periodic examination of the blood is advisable. Nystagmus in combination with diplopia and ataxia indicates dosage should be reduced.

SIDE EFFECTS: Allergic phenomena such as polyarthropathy, fever, skin eruptions, and acute generalized morbilliform eruptions with or without fever. Upon discontinuation of therapy eruptions usually subside. Rarely, dermatitis goes on to exfoliation with hepatitis, and further dosage is contraindicated. Though mild and rarely an indication for stopping dosage, gingival hypertrophy, hirsutism, and excessive motor activity are occasionally encountered, especially in children, adolescents, and young adults. During initial treatment, minor side effects may include gastric distress, nausea, weight loss, transient nervousness, sleeplessness, and a feeling of unsteadiness. All usually subside with continued use. Hematologic disorders, including megaloblastic anemia, leukopenia, granulocytopenia, pancytopenia, and aplastic anemia have been reported. Nystagmus may develop.

DILANTIN is supplied in several forms including Kapseals containing 0.1 Gm. and 0.03 Gm. diphenylhydantoin sodium.

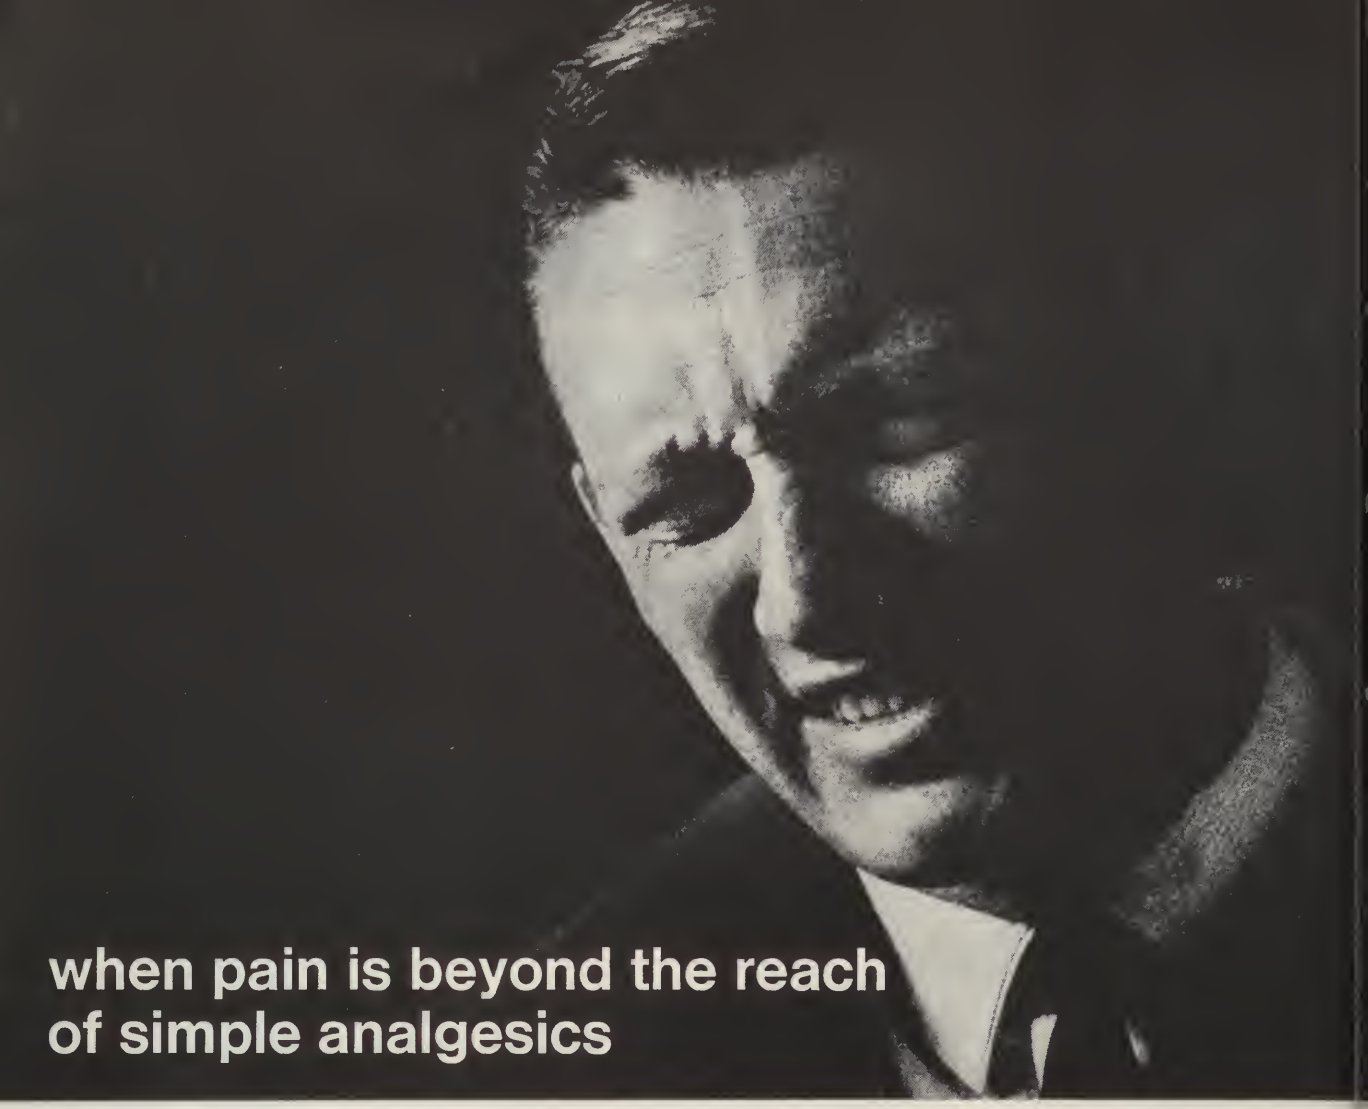
IN THE TREATMENT OF FUNCTIONAL DYSMENORRHEA AND SELECTED CASES OF PREMATURE LABOR AND 2ND AND 3RD TRIMESTER THREATENED ABORTION

In controlling abnormal uterine activity, LUTREXIN, the non-steroid "uterine relaxing factor" has been found to be the drug of choice by many clinicians.

No side effects have been reported, even when massive doses (25 tablets per day) were administered.

Literature on indications and dosage available on request.

Supplied in bottles of twenty-five 3,000 unit tablets.



HYNSON, WESTCOTT & DUNNING, INC.

BALTIMORE, MARYLAND 21201 HW&D

(LTR22)

in vivo measurement of LUTREXIN (Lututrin) on contracting uterine muscle

when pain is beyond the reach of simple analgesics

In the management of mild to moderate pain, give your patients comprehensive relief. TRANCO-GESIC extends the range of usefulness of aspirin by dimming pain perception and *also* reducing mental and muscle tension.

TRANCO-GESIC®

tablets

chlormezanone 100 mg. with aspirin 300 mg.

subdues the major contributors to pain:

- pain perception
- mental tension
- muscle tension-spasm

TRANCO-GESIC is so well tolerated it can b prescribed for anyone who can take aspirin. is non-narcotic, and free from dangers of addiction, habituation, or dependence. TRANCO-GESIC is effective in all types of mi and moderate pain. Of 862 patients who wer treated with chlormezanone and aspirin for various disorders, 88% reported excellent or good pain relief.[1]

Side effects have been minor. Occasionally gastric distress, weakness, sedation or dizziness occur. Reversible cholesta jaundice has been reported on rare occasions. However, in 4,653 patients treated with chlormezanone, 97.7% had *no* s effects.[1] *Contraindication:* just one: sensitivity to aspirin. *Dosage:* Adults, usually 2 tablets three or four times daily. Children (from 5 to 12 years), 1 tablet three or four times da.

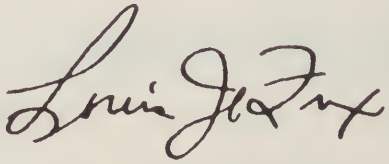
AN ANNOUNCEMENT OF SPECIAL IMPORTANCE

DOCTORS' AUTO DISCOUNT PURCHASE PLAN NOW IN EFFECT



Recently, we instituted a policy of selling 1966 Chevrolets to non-profit institutions, organizations, and associations AT COST.

In conjunction with this new policy, we have developed a SPECIAL Purchase Plan for MEMBERS and associates of the Medical and Chirurgical Faculty of Maryland.

Under this plan, qualified persons will be able to purchase new 1966 Chevrolets at prices substantially under the normal prices throughout the year.

All cars purchased under this special plan may be financed in the normal manner, if desired, and will be guaranteed by regular Chevrolet Motor Company warranties. They will also qualify for all services and facilities available through our Owner Relations Department.

Should YOU, as a member or bonafide associate of the Medical and Chirurgical Faculty of Maryland wish to participate for your own PERSONAL car, please contact Mr. Louis Foltzer, Sales Manager, at PLAZA 2-4994...for further information concerning our Doctors' Auto Discount Purchase Plan.

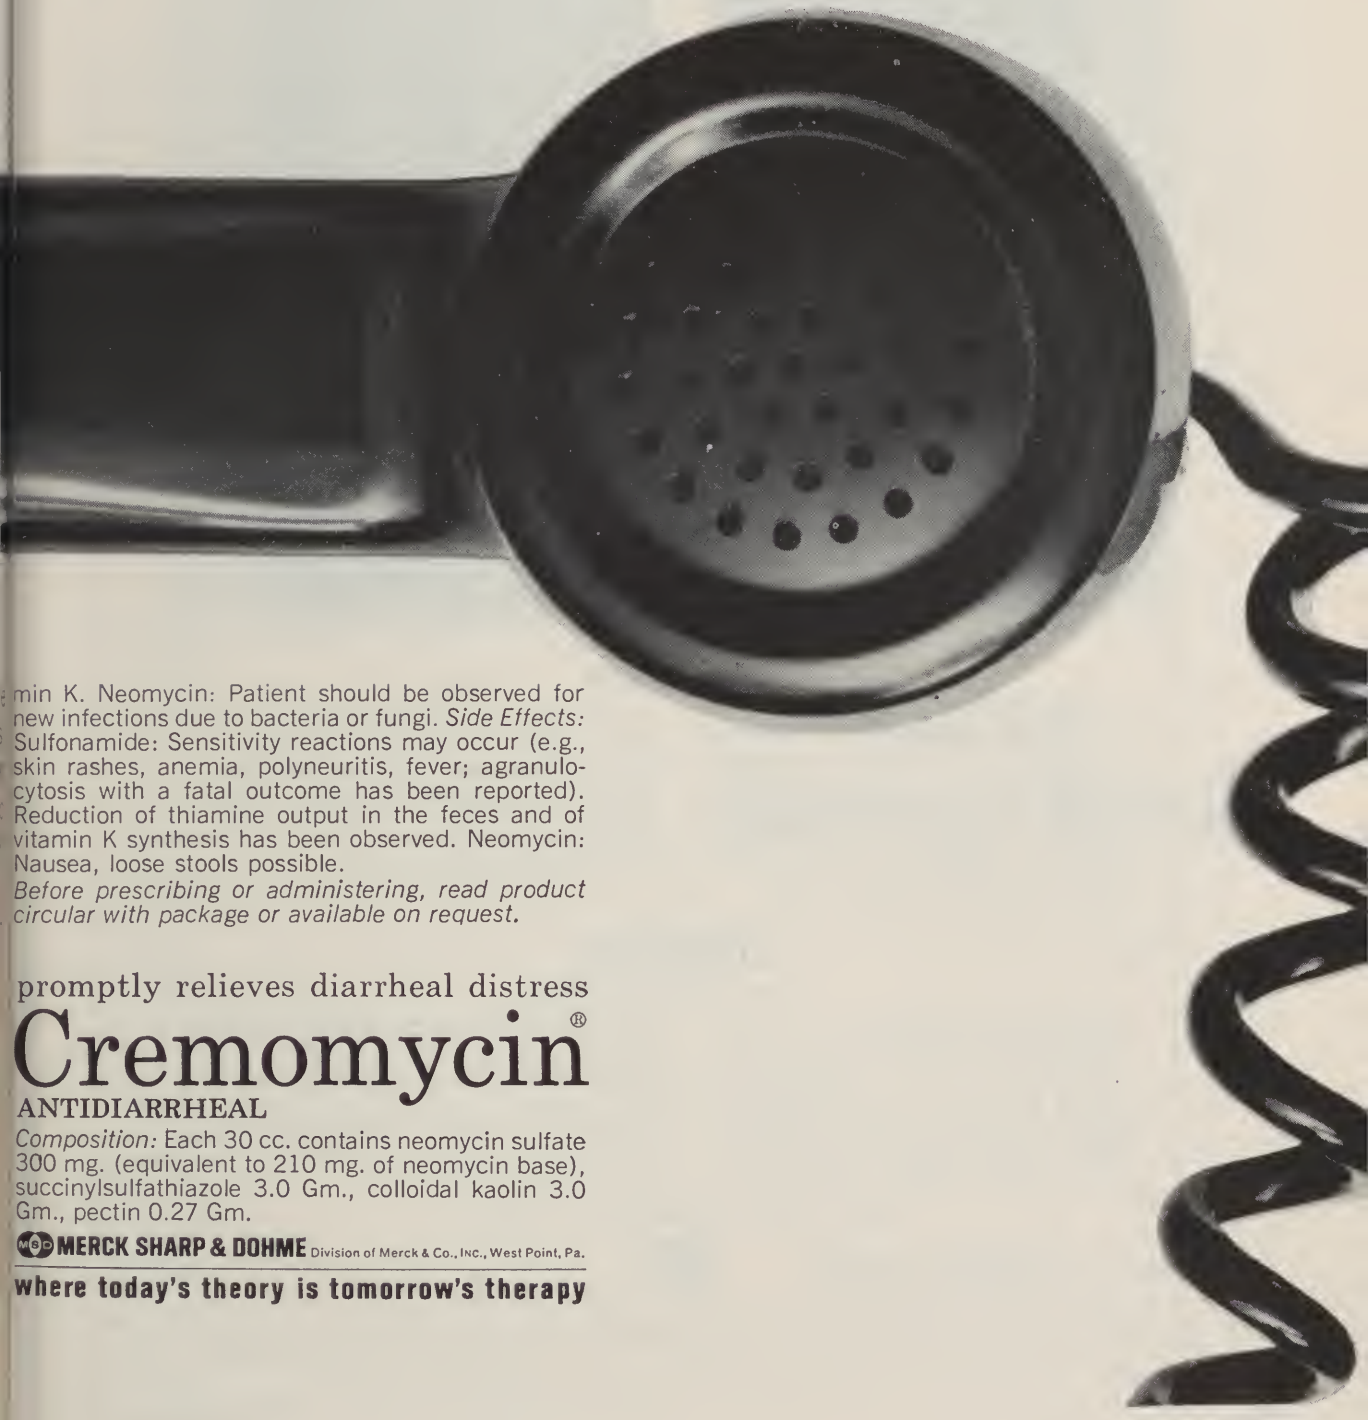
When uncontrolled diarrhea brings a call for help



When the diarrhea sufferer has run th gamut of home remedies without success pleasant-tasting CREMOMYCIN can answe the call for help. It can be counted on t consolidate fluid stools, soothe intestina inflammation, inhibit enteric pathogens and detoxify putrefactive materials—usu ally within a few hours.

CREMOMYCIN combines the bacteriostati agents, succinylsulfathiazole and neomy cin, with the adsorbent and protective de mulcents, kaolin and pectin, for compre hensive control of diarrhea.

Indications: Diarrhea. *Contraindications:* Kaolin Withhold if diverticulosis is present or suspectec *Precautions:* Sulfonamide: Continued use require supplementary administration of thiamine and vita

your ℞ for Cremomycin can provide relief

min K. Neomycin: Patient should be observed for new infections due to bacteria or fungi. *Side Effects:* Sulfonamide: Sensitivity reactions may occur (e.g., skin rashes, anemia, polyneuritis, fever; agranulocytosis with a fatal outcome has been reported). Reduction of thiamine output in the feces and of vitamin K synthesis has been observed. Neomycin: Nausea, loose stools possible.

Before prescribing or administering, read product circular with package or available on request.

promptly relieves diarrheal distress

Cremomycin®

ANTIDIARRHEAL

Composition: Each 30 cc. contains neomycin sulfate 300 mg. (equivalent to 210 mg. of neomycin base), succinylsulfathiazole 3.0 Gm., colloidal kaolin 3.0 Gm., pectin 0.27 Gm.

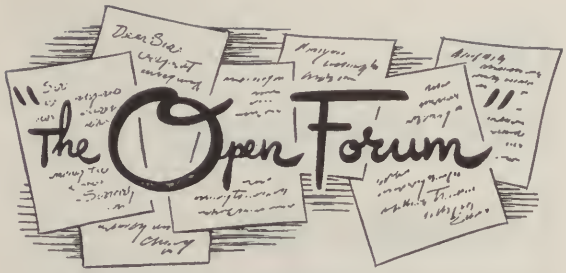
where today's theory is tomorrow's therapy

incisive

A good way to describe 'Stelazine'. It's different from the tranquilizers that sedate and dull your anxious patients. Its antianxiety effect is direct. On 'Stelazine', your patients can be calmed yet remain alert.

And 'Stelazine' offers additional benefits. Dependence has not been reported. At low doses, side effects are minimal. Its b.i.d. dosage is convenient and economical.



Stelazine®

brand of **trifluoperazine**

Indications: Symptoms of excessive anxiety. *Contraindicated* in comatose or greatly depressed states due to CNS depressants and in cases of existing blood dyscrasias, bone marrow depression and pre-existing liver damage. *Principal side effects,* usually dose related, may include mild skin reaction, dry mouth, insomnia, fatigue, drowsiness, dizziness and neuromuscular (extrapyramidal) reactions. Muscular weakness, anorexia, rash, lactation and blurred vision may also be observed. Blood dyscrasias and jaundice have been extremely rare. Use with caution in patients with impaired cardiovascular systems. Before prescribing, see SK&F product Prescribing Information.

Smith Kline & French Laboratories, Philadelphia

SK&F

To The Editor:

Cases 8 and 9, Anesthesia Accidents, on the Maternal Welfare pages of the Maryland State Medical Journal (Vol. 15: 19-20, January, 1966) merit comment. Although it is implied that the first patient succumbed to an inadvertent subarachnoid anesthesia during an attempted caudal anesthesia, the facts available do not necessarily support this. Local anesthetic drugs have been consistently demonstrated in the cerebral spinal fluid after properly administered epidural block. The actual dose of the drug metycaine is not indicated in the protocol. If 20cc. of 1.5% (usual concentration) metycaine had been injected into the subarachnoid space, the dose would have been 300 mgm. We note that 25 minutes after the beginning of anesthesia and 15 minutes after the completion of the injection, the blood pressure was 140/100 and the pulse strong and regular. This would not have been the case if the patient had received such an overwhelming dose in the subarachnoid space. Five minutes later, 20 minutes after the completion of the injection, the patient showed signs of distress—labored respirations, irregular and feeble pulse, restlessness. This might very well have been a local anesthetic drug reaction, but it may even have been related to hypotension from the supine venacaval syndrome. Regardless of the initiating factor, the injection of 1 mgm. (presumably 1cc. of 1:1,000 adrenalin) would very likely have sufficed to cause ventricular fibrillation in this hypoxic, hypotensive patient. This misdirected resuscitative effort was the last straw which put the lid on this patient's fate.

Aspiration of vomitus is the most frequent cause of obstetric anesthesia mortality. It seems that this patient was given a general anesthesia without concern as to recent ingestion of food. Only after aspiration of vomitus was the chief anesthetist called. This arrangement seems to have the blessing of obstetricians and anesthesiologists alike in many, many hospitals.

We should not mislead our reading audience by suggesting that gastric lavage after a recent meal is effective and that it will render the patient safe for general anesthesia. No technique of emptying the stomach (lavage, apomorphine) has been demonstrated to be reliable, and this particular patient would only have been safe with an endotracheal tube in place. This could have been safely accomplished under topical anesthesia, or, in expert hands, following a crash induction with thiopenthal and succinylcholine. Even here, there is always the chance that the patient might regurgitate before insertion of the tube. There seems little justification for imposing any such hazard on a para 5 gravida 6 patient anticipating a normal delivery, and who probably would be alive today with no contributions from obstetric and anesthetic personnel.

Anesthesia is one of the leading causes of obstetric mortality, and the relative contribution is increasing. This trend can only be corrected through critical analysis of the mishaps occurring.

Low host resistance?

Consider the "extra" antibacterial activity of Ilosone®

Occasionally, therapeutic failure is due to the patient's inability to mobilize his defenses sufficiently to overcome infection. Typical of this is the debilitated patient, the premature infant, or the diabetic. It is in these patients that the high levels of antimicrobial activity of Ilosone are especially useful. Ilosone has demonstrated antibacterial levels two to four times those of erythromycin base or stearate. Furthermore, it attains them earlier and maintains them longer. Even the presence of food does not appear to affect the activity of Ilosone.

Contraindications: Ilosone is contraindicated in patients with a known history of sensitivity to this drug and in those with preexisting liver disease or dysfunction.

Side-Effects: Even though Ilosone is the most active oral form of erythromycin, the incidence of side-effects is low. Infrequent cases of drug idiosyncrasy, manifested by a form of intrahepatic cholestatic jaundice, have been reported. There have been no known fatal or definite residual effects. Gastro-intestinal disturbances not associated with hepatic effects are observed in a small proportion of patients as a result of a local stimulating action of Ilosone on the alimentary tract. Although allergic manifestations are uncommon with the use of erythromycin, there have been occasional reports of urticaria, skin eruptions, and, on rare occasions, anaphylaxis.

Dosage: *Children under 25 pounds*—5 mg. per pound of body weight every six hours. *Children 25 to 50 pounds*—125 mg. every six hours. *Adults and children over 50 pounds*—250 mg. every six hours. For severe infections, these dosages may be doubled.

Available in Pulvules®, suspension, drops, and chewable tablets. Ilosone Chewable tablets should be chewed or crushed and swallowed with water.

Ilosone®

Erythromycin Estolate

May, 1966

Editorial

Presidential Editorial

J. MORRIS REESE, MD

Despite journalistic intimations otherwise, the medical profession is still considered an important opinion-molding force in the minds of most of the lay public. The people are interested in what their doctor has to say on legislative affairs even when, as in the case of PL 89-97 (Medicare), there was far from unanimity in medical ranks.

Governmental leaders are also intensely occupied in gaining the cooperation of this cogent segment of national leaders, for without the advice and statesmanship of doctors, the Medicare program will not work. This is why representatives of the American Medical Association have been importuned to work with Social Security to ensure that Medicare will be implemented with the least possible disruption by those who can make it work.

This statesmanship on the part of the medical profession is recognized as just that on all levels from that of the federal government to the local bailiwick. The Medical Chirurgical Faculty works constantly with state agencies, voluntary health associations, professional groups, and insurance representatives for the public welfare on any level.

In the state legislature, consultation is sought and carefully heeded so that physicians' opinions on matters of importance to Maryland residents may be determined. Doctors are asked to appear at public hearings on matters which are not narrowly defined as physician-oriented. The medical man is considered an educated citizen in more than one small sphere, and his advice is so solicited.

In all instances the cooperation of the medical profession in the public weal is immense and

For Physicians Offices

. . . the perfect building
. . . the perfect location

Ten-Ten is a new building which has already established itself as a prestige address. As a professional office location it is ideal. Ten-Ten is situated in the very midst of an already professional neighborhood and is outstanding in both appearance and facility. It offers your patients nearby convenient parking facilities and bus transportation stops at the door. No wonder it has been judged by many as the "perfect professional location" for physicians. Your personal investigation will bear this out to your complete satisfaction.

FEATURING:

- One of downtown's most attractive rental prices.
- Individually designed office suites, 400 sq. ft. and up.
- Private lavatory in each suite.
- Modern automatic elevator service.
- Attractive lobby with reception desk.
- 24-hours-a-day switchboard secretarial service.
- Convenient parking, eating places and other personal services.

EDWARD A. MYERBERG CO.

Main office: VE 7-2900 24 hour phone: SA 7-3888

worthy of the time-honored status of the man of healing.

Apparently, however, this is no longer enough. We are constantly being advised by self-seeking dissidents to "heal thyself doctor." Instances of almost miniscule corruption within the ranks are being used to tar a whole profession. And rather than to ignore these complaints, it behooves us to face the dissension within our own ranks and the slings and arrows of all who would bid us to re-examine our health.

We are not adverse to such self-examination. Through the Faculty, we are indeed seeking ways to strengthen the body medical. For instance, in areas of self-discipline we could well take a tip from the Bar Association which, under rules established by the courts, has authority to investigate and bring charges against members and nonmembers. Actual disciplinary action is meted out by the court itself. Perhaps a self-examination will reveal that the Maryland medical profession needs more authority to move against the few whose unethical conduct leaves the entire profession open to criticism.

Frank, honest opinions should be expressed through the democratic processes available to members on the component level. But these opinions serve nothing but a self-serving interest when based on unknowledgeable or biased points of view. If the individual physician has honestly and without bias given time to his medical society committees; if he has given due and scientific study to intrasociety problems; if he truthfully feels that he has exercised all opportunities available for expression of his viewpoint through the channels available to him, then his opinion may be considered studied and authoritative.

What is needed now, more than ever, is for the medical profession to police its own ranks and bring to task the few offenders against professional ethics, whether members or not. It is time to look consistently toward the public interest and away from purely selfish ones.

Let us consider carefully the following words from I Corinthians, 13th Chapter: ". . . Though I speak with the tongues of men and of angels and have not charity, I am become as sounding brass or a tinkling cymbal . . ."

One Signature

Insurance Protection for Doctors and Dentists

Ætna Life & Casualty's *Professional Package Policy* combines all the fundamental insurance protection you need against the risks inherent in your profession: (1) Professional liability necessary for alleged malpractice. (2) Office Premises Liability Insurance for claims arising from the operation of your office. (3) "All Risks" insurance for loss or damage to your equipment.

One conference . . . one signature is all an Ætna agent needs. Then he'll prescribe the protection that best suits you. And you'll appreciate his competence as an *insurance* professional. We call it *P.S. — Personal Service.*

EXECUTIVE SECRETARY'S NEWSLETTER

May, 1966

MEDICARE LAW

The attention of all physicians is directed to the following provision of the Medicare Law (PL 89-97) which reads as follows:

"Nothing in this title shall be construed to authorize any Federal Officer or employee to exercise any supervision or control over the practice of medicine or the manner in which medical services are provided or over the selection, tenure, or compensation of any officer or employee of any institution, agency or person providing health services; or to exercise any supervision or control over the administration or operation of any such institution, agency, or person."

EDUCATIONAL PROGRAMS

In accordance with instructions from the House of Delegates, September, 1965, the Faculty plans to offer over the MEDIC network, a session dealing with implementation of the Medicare law.

In addition, plans are underway for regional sessions at which "in-person" discussions will take place. Initial arrangements are for programs to be held as follows:

Salisbury (Worcester, Wicomico, Somerset Counties)

May 9 - Physicians
May 10 - Office Assistants

Easton and Cambridge (Talbot, Dorchester, Kent, Caroline and Queen Anne Counties)

May 18 - Physicians, in Cambridge
May 19 - Office Assistants, in Easton

Harford Memorial Hospital (Harford and Cecil Counties)

May 26 - Physicians in morning
Office Assistants in afternoon

Allegany County

June 1 - Physicians
June 2 - Office Assistants in morning

Garrett County

June 2 - Office Assistants in afternoon
Physicians in evening

Frederick County (Carroll, Frederick and Washington Counites)

June 16 - Physicians in morning
Office Assistants in afternoon

Baltimore City - through Hospital Staff activities and through MEDIC and Faculty building

The MEDIC network program will be held following a national meeting on this subject scheduled for Chicago on Saturday, June 25.

SEMIANNUAL MEETING RESOLUTIONS

Resolutions for the Faculty's Semiannual Meeting scheduled for Ocean City, Md., on Friday, September 9, at the Diplomat Motel, must be in the Faculty Office no later than:

FRIDAY, JULY 15, 1966

Resolutions received after this date will be held over for the 1967 Annual Meeting.

AMA ANNUAL SESSION

The AMA meets in Annual Session, June 26-30, in Chicago, Ill. Members who are in Chicago and would like to tour the AMA building may do so daily from 8:30 a.m. on. The Biomedical Research Institute is included in the tour.

Members may contact the Faculty's Delegates to the AMA through the Palmer House, where delegates are registered.

NEWS NOTES

New Active Members of the American Society of Anesthesiology include: Juliana G. Del Rosario, M.D., La Plata; Jae Pil Lee, M.D., and Young Choon Hong, M.D., Baltimore; and new Junior Members: Sreela Banarjee, M.D., Bethesda; Jose Gomez Duarte, M.D., Claro L. LaVina, M.D., and Leticia Cawagas Quetulio, M.D., all of Baltimore.

one mid-morning **one mid-evening**

New 300 mg tablet It's made for b.i.d.

For Adults–2 tablets provide a full 24 hours of therapy...with all the extra benefits of DECLOMYCIN...lower mg intake per day...proven potency... 1-2 days' "extra" activity to protect against relapse or secondary infection.

DECLOMYCIN®

DEMETHYLCHLORTETRACYCLINE

300mg FILM COATED TABLETS

Effective in a wide range of everyday infections —respiratory, urinary tract and others—in the young and aged—the acutely or chronically ill—when the offending organisms are tetracycline-sensitive.

Warning — In renal impairment, usual doses may lead to excessive systemic accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of discomfort.

Precautions and Side Effects — Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. Use of demethylchlortetracycline during tooth development (last trimester of pregnancy, neonatal period and early childhood) may cause discoloration of the teeth (yellow-grey-brownish). This effect occurs mostly during long-term use but has also been observed in short treatment courses. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment. Side reactions include glossitis, stomatitis, proctitis, nausea, diarrhea, vaginitis and dermatitis. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Anaphylactoid reactions have been reported.

Contraindication—History of hypersensitivity to demethylchlortetracycline.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products.

Capsules: 150 mg of demethylchlortetracycline HCl.

Tablets: film coated, 300 mg, 150 mg, and 75 mg of demethylchlortetracycline HCl.

Your MEDICAL FACULTY at Work

JOHN SARGEANT — EXECUTIVE SECRETARY

EXECUTIVE COMMITTEE, MARCH 17

1. Appointment of Raymond M. Atkins, MD, as advisor to Maryland Association of Medical Assistants was approved.

2. The State Health Commissioner requested that the Faculty send a representative to the Appalachia Conference on Health, April 21 and 22. Because of the press of Faculty activity right before the Annual Meeting, it was not possible to do so; however, the Commissioner is to be thanked.

3. Loan of certain historical items was approved for the auxiliary meeting of the American Society of Abdominal Surgeons.

4. The Faculty was authorized to become a sustaining member of the Maryland Public Health Association, subject to approval of the Treasurer.

5. Certain amendments are to be offered to the State Health Department concerning proposed rules and regulations for the operation of clinical laboratories. As amended, they are satisfactory to the Faculty.

6. The draft proposal concerning domiciliary and care home regulations was deemed satisfactory except for clarification of the reporting party.

7. The Executive Committee thought it not desirable for advertisers or solicitors to be permitted to take the Bermuda cruise, as this would enable them to engage in solicitation of physicians either formally or informally aboard ship. Such persons may take the trip on a space available basis as a vacation but not as business.

8. The Medical Eye Bank, Inc. is to be permitted continued use of Faculty facilities at no charge to them, but the handling of their business matters is to be done at the discretion of the office manager.

9. Faculty co-sponsorship of a statewide conference on Meals on Wheels was approved.

COUNCIL, MARCH 24

1. Payment of physicians' fees under the Medicare Law was discussed. The consensus was that the Health Department's Advisory Council on Medical Care will develop a schedule for use in arriving at budgetary figures for the medical care programs, providing for payment of "usual and customary" fees. This will be discussed with the Fee Schedule Committee and recommended for adoption by the Council.

2. A moment of silence was observed in memory of Albert E. Goldstein, MD.

3. Physicians Defense was ratified for members requesting it.

4. Report of a case settlement was noted.

5. Emeritus membership is to be recommended for Mary McK. Cushing, MD, Baltimore County, and Edith H. Weigert, MD, and Naomi Lucius, MD, Montgomery County.

6. Dues for 1966 were waived for a Baltimore City physician who is ill.

7. Financial statement and restricted fund statement through January 31 were approved.

8. A request to allocate up to $1,000 from the Educational Fund to pay out-of-pocket expenses of speakers representing the Speakers' Bureau Subcommittee was denied.

9. A recommendation made by the Committee on Postgraduate Education, Preventive Medicine, and Public Health concerning a recruitment council was not adopted, as one already exists. The

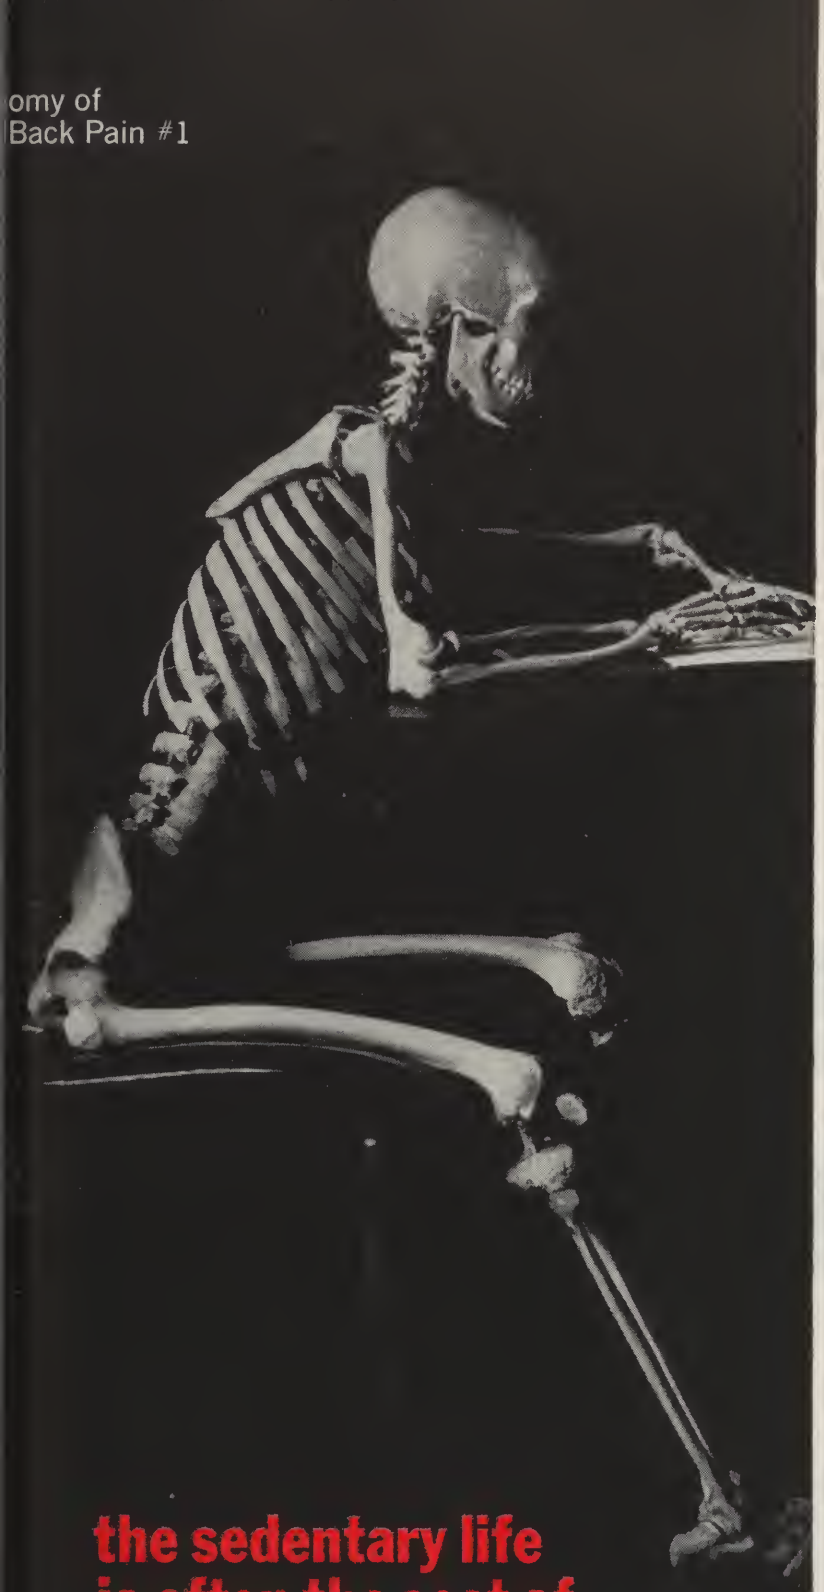
Take Beltway Exit 20 North. HU. 6-4436.



Committee is to be advised that the Council would consider a recommendation regarding medical and paramedical *placement.*

10. No action was taken concerning the proposed immunization program of the State Department of Health.

11. The Liaison Committee advised the Council, for its information, that the Health Department does not make its facilities available to any special-interest groups.

12. The Montgomery County Medical Society has protested Faculty approval of the Blue Shield Prevailing Fee Program. The Society is to be advised that the Council did not approve this program. It is to be further advised that the Montgomery County representative on the Council has attended only two meetings in three years. If the Society wishes to replace their Council representative they should request the resignation of the incumbent. Finally, the Society is to be advised that the survey is being done by Blue Shield, not by the Faculty.

omy of
Back Pain #1

the sedentary life is often the seat of low back pain

The human spine is not engineered for prolonged sitting at desks, pianos, typewriters and drafting boards. The stresses set up by the heavy, forward-tilted head and trunk, balanced precariously on an insufficient base, result in strain of the dorsal musculature, particularly at the low lumbar level.

The unusual muscle-relaxant and analgesic properties of 'Soma' make it especially useful in the treatment of low back sprains and strains. 'Soma' is widely prescribed ☐ **to relieve pain** ☐ **to relax muscles** ☐ **to restore mobility.**

Indications: 'Soma' is useful for management of muscle spasm, pain, and stiffness in a variety of inflammatory, traumatic, and degenerative musculoskeletal conditions. It also may act to normalize motor activity in certain neurologic disturbances.

Contraindications: Allergic or idiosyncratic reactions to carisoprodol.

Precautions: 'Soma', like other central nervous system depressants, should be used with caution in patients with known propensity for taking excessive quantities of drugs and in patients with known sensitivity to compounds of similar chemical structure, e.g., meprobamate.

Side Effects: The only side effect reported with any frequency is sleepiness, usually on higher than recommended doses. An occasional patient may not tolerate carisoprodol because of an individual reaction, such as a sensation of weakness. Other rarely observed reactions have included dizziness, ataxia, tremor, agitation, irritability, headache, increase in eosinophil count, flushing of face, and gastrointestinal symptoms.

One instance each of pancytopenia and leukopenia, occurring when carisoprodol was administered with other drugs, has been reported, as has an instance of fixed drug eruption with carisoprodol and subsequent cross reaction to meprobamate. Rare allergic reactions, usually mild, have included one case each of anaphylactoid reaction with mild shock and angioneurotic edema with respiratory difficulty, both reversed with appropriate therapy. In cases of allergic or hypersensitivity reactions, carisoprodol should be discontinued and appropriate therapy initiated. Suicidal attempts may produce coma and/or mild shock and respiratory depression.

Dosage: Usual adult dose is one 350 mg. tablet three times daily and at bedtime.

Supplied: Two Strengths: 350 mg. white tablets and 250 mg. orange, two-piece capsules.

Before prescribing, consult package circular.

for the relief of low back sprains and strains

SOMA®
(CARISOPRODOL)

Wallace Laboratories, Cranbury, N.J.
26S01J

An antibiotic of choice is one that works

TAO works

Susceptibility Results
Staphylococci [2,3,1]

# OF CULTURES	YEAR	% EFFECTIVE
6,725	1962	88.6%
5,440	1963	88.0%
10,384	1964	88.5%

β-Hemolytic Streptococci [2,3,1]

2,448	1962	89.5%
1,519	1963	95.2%
2,492	1964	96.7%

The Product

In a world study of antibiotics *in vitro*[1], TAO had an overall effectiveness of 87.3%, higher than chloramphenicol and erythromycin, and significantly higher than tetracycline and penicillin.

The Plus... Consistent Performance

Yet antibiotics must not only work. They must work consistently. Here are the results from the largest study of microbial susceptibility ever undertaken. In 29,048 cultures of overt staphylococcal and β-hemolytic streptococcal infections, note the consistency of results with TAO.

TAO®
[triacetyloleandomycin]

ROERIG

J. B. Roerig and Company, New York, New York 10017
Division, Chas. Pfizer & Co., Inc., Science for the World's Well-Being™

TAO Rx information

Indications: The bacterial spectrum includes: streptococci, staphylocci, pneumococci and gonococci. Recommended for acute, severe infections where adequate sensitivity testing has demonstrated susceptibility to this antibiotic and resistance to less toxic agents. **Contraindications and Precautions:** TAO (triacetyloleandomycin) is not recommended for prophylaxis or in the treatment of infectious processes which may require more than ten days continuous therapy. In view of the possible hepatotoxicity of this drug when therapy beyond ten days proves necessary, other less toxic agents, of course, should be used. If clinical judgement dictates continuation of therapy for longer periods, serial monitoring of liver profile is recommended, and the drug should be discontinued at the first evidence of any form of liver abnormality. It is contraindicated in pre-existing liver disease or dysfunction, and in individuals who have shown hypersensitivity to the drug. Although reactions of an allergic nature are infrequent and seldom severe, those of the anaphylactoid type have occurred on rare occasions. **References:** 1. The Vise of Alcohol

JOHN O. NEUSTADT, MD†

WHEN I WAS TRYING to reconstruct the planning that went into setting up this panel by Dr. Vernon Smith and his committee with its special attention on medical vice ("Medical Aspects of Vice" is what the program says), the order of panelists interested me. Here we were all assigned a half hour to cover these aspects in this fashion, and I wondered why the order was originally gambling and the girls, then smoking, then drinking. I don't know what change led to placing the discussion of smoking first, whether that indicates an increasing or decreasing order of importance. In any case, I came to the conclusion that the order had been decided on by this principle: that after an evening at cards with the girls in a smoke-filled room, or even more so in a smoke-emptied room, there's nothing to take the place of a good stiff drink.

This interpretation of the order of the speakers at this meeting was presented by me to the former dean of the Johns Hopkins University School of Medicine, his successor, and several other of the senior medical men in that institution at lunch yesterday. They disagreed with me. Led by the present dean, they concluded instead that the unmistakable purpose of the planners of this panel was to provide this audience with this knowledge: prostitutes should never gamble with smoking in bed while drunk.

You may agree with me that it is strange the activities that have been listed here tonight as vices: smoking, drinking, gambling, and sex. I suppose we should be thankful that so far nobody in medical research has turned up indisputable indications that breathing, neither breathing in nor breathing out, is especially dangerous. Actually, it *is* somewhat dangerous if carried to extremes and can become so severe a habit as to be called a vice. It might then be labeled "air-greed," or, put in scientific German, "Luft-Lust."

Certainly those of us who have worked with patients in hospitals have seen them become addicted to having their breathing done for them, as for instance patients in a respirator, after their recovery from poliomyelitis and other illnesses. The difficult problem is to wean them from the respirator. That's how everyone on the ward talks about it—as a weaning process.

Now there's another breathing assistance that has come into vogue in recent years, thanks largely to the efforts of Dr. Peter Safar, who was at the Baltimore City Hospitals for many years; this is called "mouth-to-mouth breathing." I understand that it has become extremely popular among young people on the beaches in the evening; hence it, too, could become an addiction or a vice.

Without question vices relating to alcohol merit our attention. And there are *some* vices that are surely connected with alcohol. There is, for example, a sense of willful choosing of possible harm that sets the stage for what we call alcoholism.

Nonetheless, it is well that we not overlook the virtues that go along with these vices. Let me quote for your pleasure from the incomparable Dr. William Dock's remarks. Dr. Dock is from New

Presented May 7, 1964, at the annual meeting of the Medical and Chirurgical Faculty of the State of Maryland. This paper was part of a panel on "Medical Aspects of Vice."

†Dr. Neustadt died November 19, 1964. He was assistant professor of psychiatry and instructor in medicine, The Johns Hopkins University School of Medicine.

York City, and he attended a symposium on alcohol in that absolutely appropriate state of California in 1961, where he said we need

> Proper perspective about alcohol in an age and land where the therapeutic and civilizing functions of alcohol are concealed by its abuse among those crippled in the urban rat-race. . . . We seem now to have a nihilistic attitude toward a chemical which is a proved diuretic, a stimulant of gastric secretion, a dilator of blood vessels; and which, above all, has an action on the mind which by varying the dose and the rate of ingestion can bring either cheerful bustle or profound anesthesia.[1]

Dr. Dock went on to say,

> Alcohol, as the human race discovered thousands of years ago, makes one's troubles whether organic or emotional seem less alarming. This carefree attitude, so dangerous for the automobile driver, is most helpful for the aging parents of normally ungrateful children (and there is the genius of Dr. Dock, that word "normally"), as well as for the man or woman with failing sense organs or failing vital organs, with dying contemporaries and a narrowing circle of friends.

Dr. Dock was obviously feeling his age but, as always, quite illuminatingly for the rest of us. There are a few other quotations from that same symposium that you might enjoy. Jules Masserman:

> Addiction to drink, then, is a "disease" only in the sense that excessive smoking, gambling, or wandering are also "dis-eases"; that is, partly condoned ways in which men try to haze over, compensate for, challenge, or escape from . . . un-ease.

Also Chauncey Leake:

> The use of alcoholic drinks at the end of an emotionally gruelling day may have a real civilizing effect on the over-tense, over-wrought, over-anxious, and over-irritable *husband* (that's the only noun in his comment so far) seeking rest and peace in his home. . . . A couple of cocktails . . . will really perform wonders in helping husband and *wife* (now the other noun comes in) to feel tolerant and understanding of each other.

Finally, Leon Greenberg summarized it: Alcohol used in moderation is, I believe, of all the tranquilizers, probably by far the oldest and probably, for most people, by far the safest"; and Dr. Dock suggested that anyone who invented alcohol yesterday would be a billionaire today.

But it is obvious that we are here to talk about alcohol not just in these socially useful, graceful, and amusing ways but about its abuses. In this connection, perhaps many of you are aware of the medical legend that says that all doctors suffer from their own diseases: for instance, all neurologists and neurosurgeons have migraine. The legend gets a little shaky when you talk about male obstetricians and gynecologists, but I have been thinking, in preparation for this panel, that this legend puts Dr. Hochbaum in a rather compromising position, me in a somewhat worse position, perhaps; but I am not sure that I don't envy Dr. Linden.

Fig 1

DEFINITIONS OF ALCOHOLISM

I. Chronic behavioral disorder:
- **1. detrimental preoccupation,**
- **2. loss of control,**
- **3. self-destructive attitudes;**

resulting from:
- **a. early deprivation and altered physicochemical responses,**
- **b. significant identification with excessive alcohol users,**
- **c. milieu causing ambivalence, conflict and guilt.**

(Chafetz & Demone, *Alcoholism & Society, 1962.*)

II. "Any use of alcoholic beverages that causes any damage to the individual or society or both."

(Jellinek, *The Disease Concept of Alcoholism, 1960.*)

Definitions of alcoholism, adapted and quoted from two recent texts.

Alcohol and alcoholism are so familiar to so many of us that, like all such things, it is curiously difficult to see them. They're so close we can't even make out their features. It's like our friends, our family, the paintings in the room, we so often don't realize what is present until we conscientiously set out to take account.

Let me show you what alcoholism is like as a field of study and how, for instance, two serious and important investigators can diverge apparently when trying to frame the essence of what they are talking about. Figure 1 is taken from two of the best recent books.

Alcoholism is a "chronic behavioral disorder" signaled by a "detrimental preoccupation" with alcohol, which means a continually increasing and damaging obsession. "Loss of control" means that once the drink is taken, a person of this description is not able to stop. Dr. Tuerk tells about a man who knew that he should never take the *first* drink; so he learned to go into a bar and ask the bartender for a drink, which he then set aside, in order to begin with the second. "Self-destructive attitudes" are exemplified not only in these alco-

Fig 2

ALPHA ALCOHOLISM

("Problem Drinking")

1. **Psychological reliance: relief of felt pain.**
2. **"Undisciplined" rule-breaking: time, place, event, amount, effect.**
3. **Damage: Interpersonal Family Budget Some absenteeism production loss nutritional deficiencies.**
4. **NO Loss of Control Inability to Abstain Withdrawal Effects Signs of Progressive Process.**
   (Yet, may be developmental stage.)
5. **Symptom of pathology it relieves.**

"Alpha alcoholism," one of the species defined by Jellinek, as adapted from *The Disease Concept of Alcoholism*.

holic involvements but in other matters as well.[2]

The "resulting from . . ." portions of the definition represent efforts to bring together a wealth of material, some of it speculative, some of it illuminating, and some biochemical. For instance, the "early deprivation and altered physicochemical responses" implies that there is a biochemical parallel to the emotional life.

"Significant identification with excessive alcohol users" means early intimacy with repeated drunkenness, maybe in good old Uncle Charlie whom he really loves. The "milieu causing ambivalence, conflict and guilt" refers to many other issues in addition to alcohol.

The second the bare-bones definition of Jellinek.[3] Let me read you what Jellinek said in defense of this definition. "Vague as this statement is, it approaches an operational definition," and as a weary investigator in the field of alcoholism, I can assure you he's right. Jellinek goes on:

> It may be said that such a loose definition has little value. With such a vague definition, we cannot even ask whether alcoholism so defined is an illness. Obviously, there are species of alcoholism—so defined—which cannot be regarded as illnesses. One may well say that such a vague definition is therefore useless. But in this uselessness lies its utility, for it forces us to single out species of alcoholism . . . and to speak of them in stringent terms. We must be particularly definite about those forms which we wish to examine as possibly constituting illnesses."

Jellinek went on to spell out what he means by the various species of alcoholism, particularly those he proposes be accepted as illnesses. These were covered recently by Dr. Marvin Block when he spoke before the City Medical Society. I've tried to compress and put them together for this occasion.

Figure 2 illustrates what Jellinek calls "Alpha alcoholism," which means the way so many people you know drink, but it doesn't necessarily become an illness. "Problem drinking," psychological dependence, undisciplined, these are the people who drink too much in the wrong places. It can damage interpersonal life, family budget, and work but without any loss of control or the inability to abstain; with no withdrawal effects nor progression. Yet, it may be a developmental stage, when reviewed years later. The final statement is very nice, the usual paradox that is so often useful: a symptom of the very pathology that it relieves. Excessive drinking relieves something, and what it relieves it is also a symptom of.

The Alpha is a whiskey drinker, and may well be called an alcoholic in America; but Beta alcoholism (Fig. 3) is the wine-drinking, French-type alcoholism, and I've called it here "insidious imbibition." Beta alcoholism results partly from the social pressures of the community that conspire to make people drink frequently and, combined with poor nutrition, produces most of the common diseases we know that go along with alcoholism. Jellinek says "no interpersonal damage," but I have added that question mark; I find it difficult to believe. No withdrawal effects and no dependence—these people just drink incessantly, by his account.

Fig 3

BETA ALCOHOLISM

("Insidious Imbibition")

1. **Social habituation & pressures: custom, culture, economics.**
2. **Poor nutrition and physical damage: cirrhosis, gastritis, polyneuropathy; nutritional deficiency diseases.**
3. **Damage: family budget, production loss, curtailed life span.**
4. **NO Interpersonal (?) Withdrawal Effects Dependence, psychological or physiological.**
   (Yet, may be developmental stage.)

"Beta alcoholism," another species defined by Jellinek, adapted.

Fig 4

GAMMA ALCOHOLISM
(AA Image)

1. **Physical dependence ("craving") and withdrawal effects.**
2. **Acquired increased tissue tolerance and adaptive cell metabolism.**
3. **Loss of control.**
4. **Damage: Greatest, in all spheres.**

DELTA ALCOHOLISM
("Inveterate Drinker")

As above but,

3: **Inability to abstain (vs loss of control).**

"Gamma" and "Delta" alcoholism, adapted from Jellinek.

Gamma alcoholism (Fig. 4) is the one that interests Jellinek the most. He considers AA influential in having made it regarded as the only type of alcoholism where there is true physical dependence—what they call "craving"—and a real withdrawal syndrome. And then these terms "tissue tolerance" and "adaptive metabolism" I won't bother to define for you now, but they mean that something has changed in the central nervous system. *Loss of control* is the principal manifestation; one drink and that's it, although these drinkers can often abstain between bouts. Damage is great in all the spheres mentioned.

Delta alcoholism (Fig. 4) is the equivalent French version of going over the boundary into true addiction; this is the inveterate drinker. All these things are the same except he cannot abstain like the American whiskey-drinker. He drinks his three liters of wine every day, every single day, but he doesn't "lose control."

Figure 5 shows some of the other species Jellinek mentions, added to a little by me. "Alcoolisation" is a French term; you certainly know what "drunken driving" is; and "periodic dypsomaniac," the fellow who stays dry for six months and then goes on a prolonged spree. "Explosive drinking" occurs when a man takes just a few drinks and then becomes really psychotic; "fiesta drinking," like people who go to New Orleans in February; "lost weekending"—you know as many of these as I do. Perhaps the chief merit of Jellinek's scheme, as he himself comments, is that his use of the Greek alphabet allows for numerous species to be added.

Fig 5

OTHER ALCOHOLISM SPECIES
(α-ω)

"Alcoolisation"	**Explosive Drinking**
Drunken Driving	**"Fiesta" Drinking**
Epsilon: "Periodic Dipsomania"	**Lost Weekending**
	You Name It.

Other species of alcoholism, adapted from Jellinek.

The incidence of alcoholism is the next issue to consider. It's difficult to estimate the statistical impact, and the reason is obvious. People just don't run down to the health department and check in to tell them, "I'm now an alcoholic, not a gambler, nor a prostitute, and so forth." An indirect method is necessary to get some idea of the magnitude of the incidence.

Fig 6

JELLINEK ESTIMATION FORMULA (1940)

$$\text{"Ailing" Alcoholics} = A' = \frac{D\,P}{C_1 C_2} \times 100 = \frac{D\,P}{K}$$

where A′: Ailing alcoholics alive in a given year,
D: # reported deaths from cirrhosis that year,
P: % D attributable to alcoholism,
C_1: % Ailing alcoholics with cirrhosis,
C_2: % C_1 dying from cirrhosis.
K: $\frac{C_1 C_2}{100}$.

Then, Total Alcoholics = A = R A′,
where A: all alcoholics alive in a given year,
and R: ratio of all alcoholics to all ailing alcoholics.

The Jellinek formula for the indirect estimation of the incidence of alcoholism, based on observable incidences of cirrhosis; and adapted from Jellinek.

Jellinek devised this formula (Fig 6) to obtain some rough approximation of the impact of alcoholism, as derived from observable medical facts.[4] The formula depends on taking the observable facts, like the number of deaths reported annually from cirrhosis (D in the formula) and the findings of cirrhosis in alcoholics, whether incidental (C_1) or fatal (C_2). These determinable facts also permit an immediate estimation of one other factor: how many of the deaths from cirrhosis were related to alcoholism (P). This can be determined by history and examination.

Fig 7

ALCOHOLISM INCIDENCE: 1960

	Total	Men	Women	Men:Women	Rate (DAP)	Rank
1. USA (10^6)	4.5-6.4	3.8	.7	5.4	4%	
2. Maryland (10^3)	73.8-105.5	64.5	9.3	7.0	4%	17
3. Nevada (10^3)	11.7	10.3	1.4	7.4	11%	1
4. Alabama (10^3)	32.7	26.4	6.3	4.2	2%	48

The incidence of alcoholism in the United States and selected states in 1960, as estimated by Efron and Keller, using a modification of the Jellinek formula; with supplemental estimates by Gibbs.

All of these factors go together in this way to give you a figure that stands for "Ailing Alcoholics," which is my brief term for what is called "alcoholics with complications." Taking that number, and using an estimated ratio of four or five to one (the ratio obviously varies in different places at different times), you can find out how many alcoholics there are altogether by the Jellinek formula. So far, this is the only standard way of making reasonably valid estimates of alcoholics in a given area.

Reviewing all this, I wondered if maybe in some circles a more direct method of estimation might not be to count the number of guests still going strong at a cocktail party three hours after it was supposed to be over and multiplying by the number of olives left in the martini glasses.

Figure 7 gives some statistics reached by application of the Jellinek formula. The 1960 alcoholism incidence for the USA as worked out from that formula (modified) was 4.5 million.[5] Dixon Gibbs questioned the validity of this estimate and went back over the figures and the original formula. He got the estimate of 6.4 million, and I think he's right.[6] But, using the 4.5 million figure as given by Efron and Keller, here's how it divides between men and women: 3.8 million men and 700,000 women. The ratio is 5.4:1. Perhaps the most significant way of looking at these totals is this figure of 4% in the column marked *Rate*. The *DAP* abbreviation stands for the *Drinking Age Population*, which is everyone in the United States over the age of 19. In effect, this states the important comparison of actual alcoholics as compared with all those who might be considered to be at risk of alcoholism.

The next figures are for Maryland and are in the thousands, ranging from 74 to 105 in Keller's[5] and Gibbs'[6] estimates. You notice that the ratio of men to women in Maryland is higher than the national average, whatever that means. You also notice that we rank seventeenth in the states and with a rate exactly the same as for the entire country.

Nevada has the highest incidence of alcoholism, and here you see the number of men and women. The ratio of men to women is even higher than the national average; hence the likelihood that the problems brought to Reno contribute to these figures just doesn't seem to show.

Alabama has the lowest incidence, and the ratio of men to women drops way down. My conclusion is that the gallant southern woman wants to save her man from danger and to make the ultimate sacrifice by sharing his condition.

My professional interest in the incidence of alcoholism dates back more than 10 years because of my connection with the Baltimore City Hospitals, where alcoholism matters tremendously much. One day in November, 1960, four assistant residents who were running the four medical wards estimated for me the impact of alcoholism in all medical patients present on the wards for all medical reasons. In order not to influence them with my bias, I asked them to do the rating without consulting with me or anyone else. I asked them to consider that "non-alcoholic" means that the patient either doesn't drink or doesn't drink any more than they do or doesn't drink enough to be a problem as far as they can tell. If they think he is an alcoholic, please rate him as doctors do everything, on a scale of 1 to 4 plus.

Figure 8 shows the results of that study. These are all acute medical patients. There were 67 on the ward at the time. (We did not include polio patients, who were from a different socioeconomic

Fig 8

ALCOHOLIC SURVEY: BCH 1960

	Men	Women	Total
1. All acute medical patients	34	33	67
2. Obvious drinking problems	20	6	26
3. Percentages	59%	18%	39%

Alcoholism among all patients on the acute medical wards of the Baltimore City Hospitals on November 29, 1960, as estimated by the four assistant residents in medicine in charge of the wards. (Poliomyelitis patients omitted; also admissions and discharges of that day.)

Fig 9

ALCOHOLIC SURVEY: BCH 1964

	Men	Women	Total
1. All acute medical patients	43	22	65
2. Obvious drinking problems	31	8	39
3. Percentages	72%	36%	60%

Alcoholism among all patients on the acute medical wards of the Baltimore City Hospitals on April 30, 1964, as estimated by the six assistant residents in medicine in charge of the wards.

Fig 10

ALCOHOLIC SURVEY: JHH 1964

	Men	Women	Total
1. All acute ward medical patients	62	57	109
2. Obvious drinking problems	27	10	37
3. Percentages	44%	18%	34%

Alcoholism among all patients on the acute medical wards of the Johns Hopkins Hospital on May 1, 1964, as estimated by the nine assistant residents in medicine in charge of the public wards.

class, nor patients admitted or discharged that day, whose charts were not in the office.) The number of men and women was about the same, meaning men and women on the wards for everything from heart attack to arthritis to whatever. The incidence of alcoholism among male patients was estimated by these assistant residents (and their separate estimates compare reasonably well) as roughly 60%; and among women as roughly 20%; for a net 40%.

Negro and white patients were approximately equal in number so that racial factors seemed irrelevant. Particularly important was the fact that most of the alcoholics in these estimates were in the mild-moderate categories, which means potentially redeemable. The more severe alcoholics were all hospitalized for illnesses directly related to alcohol.

My wife pointed out that a one-day sample might not be very convincing. It could be slanted, or just happen to be true that day or that season, and might be different on another occasion. So I repeated the survey last week (Fig 9). This time there were 65 patients on the ward, and the estimates of alcoholism were 72% among the men; 36% among the women; with a 60% overall. I don't quite believe these figures, and my guess is that the residents were not as fully instructed as the time before. I am not at BCH full time now, and I will have to go back over these figures with the assistant residents because I think some of them put too many patients down as alcoholics. In any case, it shows at least that there is no improvement in the four years since we did the first survey and that the figures are no better.

Then I thought perhaps all this might be viewed as something special in the City Hospitals' population. So the next day I went on the public medical wards at Johns Hopkins and did the same thing (Fig 10). Here we have 109 patients in all, and approximately the same number of men and women; and the reported alcoholism was 44% of the men; 18% of the women; for a 34% average overall. I also don't believe these figures entirely either, but for the opposite reason. There were some assistant residents who were too conservative, as their chief resident had warned me might be true. Certainly when two residents are on the same floor, dividing up the care of patients evenly, when one of them reports no alcoholics and the other reports four or five, it doesn't seem entirely likely. In any case, these figures from the 1964 studies at both City and at Hopkins have not been worked over with the same intensity and careful review as the 1960 study. But they do give at least a consistent idea of the magnitude of the problem.

There are many important theories, hypotheses, and apparent factors connected with how alcoholism starts. I am not going to try to cover them all but rather to focus on one or two. Psycho-

analysis, with theories of orality and so forth as discussed by Dr. Linden, provided initially exciting ideas and more recent investigations have been turning up some new considerations. I thought you might be interested to learn about these newer approaches, since the older notions have been such common coin throughout the many years since Freud's discoveries.

It was once associated with Dr. Lester Gliedman, at Hopkins, who was productively struck by the clear fact that so many alcoholics have a tremendously constricted time-sense. They just seem to be aware only of the present. Indeed, he called this "present-orientation"; and the attitude it represents could well be characterized as impatience. Similarly, the inattention to the past, you might refer to as impulsivity; and the corresponding inattention to the future, heedlessness. These three characteristics of impatience, impulsivity, and heedlessness are indeed striking.

Then, Dr. Gliedman became fascinated with the many intriguing parallels between alcoholism and another condition in which these three characteristics are often seen so clearly: brain damage. He began some studies that we, his colleagues, have carried on to explore the interplay between heavy drinking and early brain damage, as well as personality factors. We believe we have found significant differences in the conditionability and arousal patterns for alcoholics as opposed to controls, matched in all other regards, which may shed some light on this interplay.

The most promising line of investigation today deals directly with the most critical issue in alcoholism. Lots of factors have been considered: psychological, physiological, sociological, and other possibly fruitful approaches to understanding alcoholism. But the critical center is when and how this escape route, this habit, this dependence, becomes an addiction with all the properties of any addiction that we know anything about—morphine addiction, cigarette addiction, any other. The best work that I know on this central problem has been done by Dr. Robert Myers, who used to be at Hopkins and is now at Colgate, and I would like to sketch it for you briefly (Fig 11). He put little tubes into the brain ventricles of rats to avoid the problem of absorption, of crossing the blood-brain barrier, and so forth. These charts simply show that the rats that got high concentrations of alcohol steadily in their brains developed a fantastic taste for drinking the most fantastic quantities of alcohol, up to 30% concentration; this was a breed of rat that normally drinks no more than 5% or 6% in water. In the experiment, the control rats amiably sipped alcohol in concentrations of 3% most of the time, but they balked as the beverage concentrations were increased and went completely on the water wagon as the alcohol concentration approached 10%. But the rats infused cerebrally with the highest amounts of alcohol kept slugging away the drinking alcohol almost exclusively until the beverage concentration passed 30%![7]

Figure 12 is another chart from the same paper by Myers,[7] which records an even more striking observation that is as profoundly important as any yet in the literature. Here, alcohol in microliter amounts was put into the brains of rats for five days and then was stopped. But even after the brain infusion was stopped, the rats went along preferring to drink alcohol in concentrations up to 15% as against water. Then for five days the rats were given nothing to drink but water. Then they were offered alcohol again, and again they preferred it to water in the 10%-15% range of concentration. Tranquilizing drugs for the next few days had slight effect, except perhaps to whet the rats' taste for more alcohol. (These were rats with no previous experience with alcohol, of a breed that normally will not drink greater than a 6% alcohol concentration.)

I would like to say a few serious words about what it means to be an alcoholic. It does not seem likely to me that hell is any the less hell because it was built drink by drink by the inhabitant nor because it exists now just as well as hereafter or can be found night after night as well as in eternity. There are those who can and those who do drink sociably and enjoyably as part of the celebration of home and family, of friends and warmth, those who drink in time-honored associations and even in celebration of God's goodness and His gifts. But there are those, many of them better men than I, for whom that same warm cup that cheers and delights or makes tender and vivid becomes the avenue to degradation, self-hate, and destruction of themselves and everything they love. Some of the best brains ever fashioned finally procured their own destruction, or near destruction, by taking enough alcohol to turn that often friendly substance into a poison that no brain, no matter how wonderful, can forever withstand.

I had the extraordinary fortune to know only

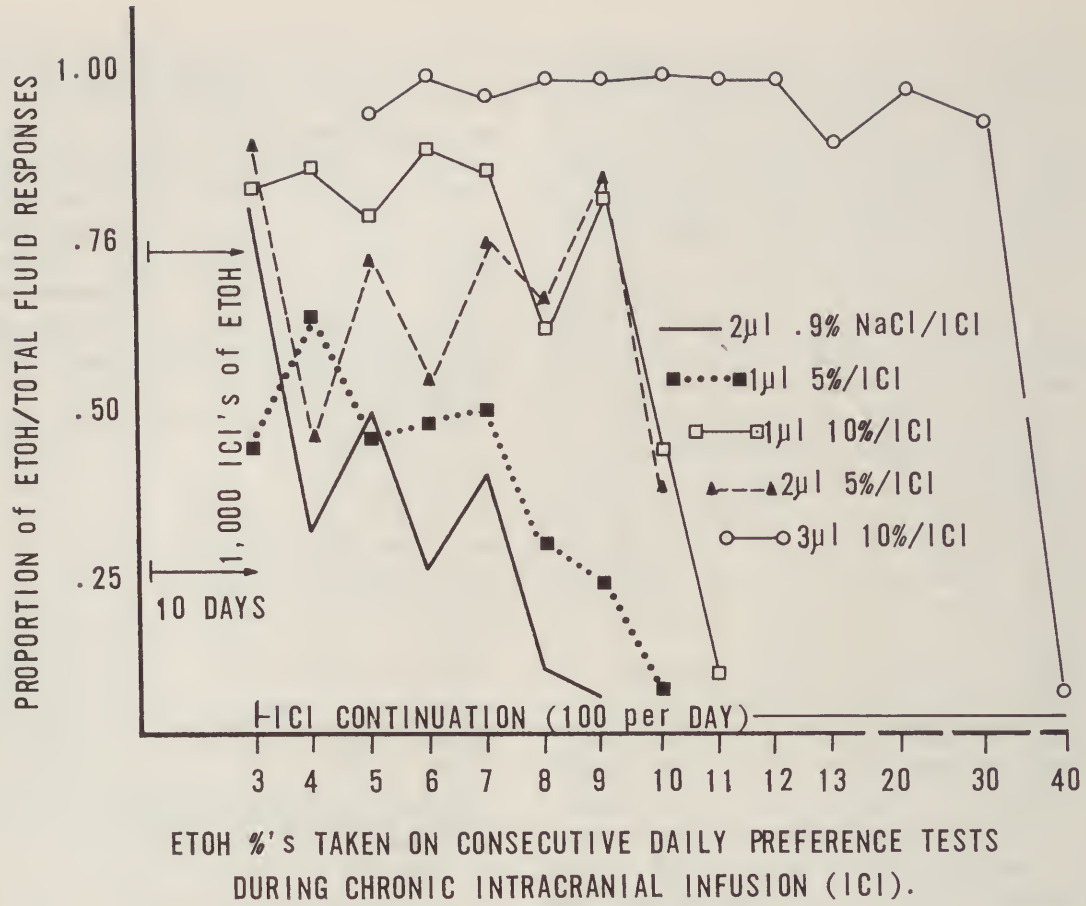

Fig 11

Preference for drinking high concentrations of alcohol (as opposed to water) in rats infused intracerebrally with high concentrations of alcohol, as compared to control rats infused with saline and lower concentrations of alcohol.[7]

slightly, but unforgettably, when I was 17 or 18, one of those glorious brains that some of you here tonight may have known better than I. It belonged to F. Scott Fitzgerald, and I am sure that is one reason that I am standing here on this panel tonight in this role.

There are other once beautiful persons whose names are familiar to you all that I could mention, but perhaps we would do better instead to call that roll together in silence and in prayer. And let me remind you that in some eyes, namely their children's, those BCH patients I counted for you aren't just statistics, but every bit as dear, as crucial, and as determining to those children as the finest and noblest names I could have mentioned a moment ago.

I bring this all up in this way because this is the way that people like myself feel who work away at this problem. The problem is, of course, infinitely more complex and monstrous than our few poor tools to deal with it. And there are those who scoff at efforts by hospitals, doctors, and many specialists, not just psychiatrists, in fact not even particularly psychiatrists, but various doctors, psychologists, social workers, clergymen, nurses, and all the honorable roll. Some people scoff at all that. They scoff at the official stand of the AMA that categorizes alcoholism as an illness and hospitalisable. They think that the attempt to find a formula for making alcoholism a matter of serious, responsible, scientific, and helpful concern is simply nonsense. These are the people who say, "It's a weakness," "It's a self-indulgence," "It's a deliberate willing of evil versus

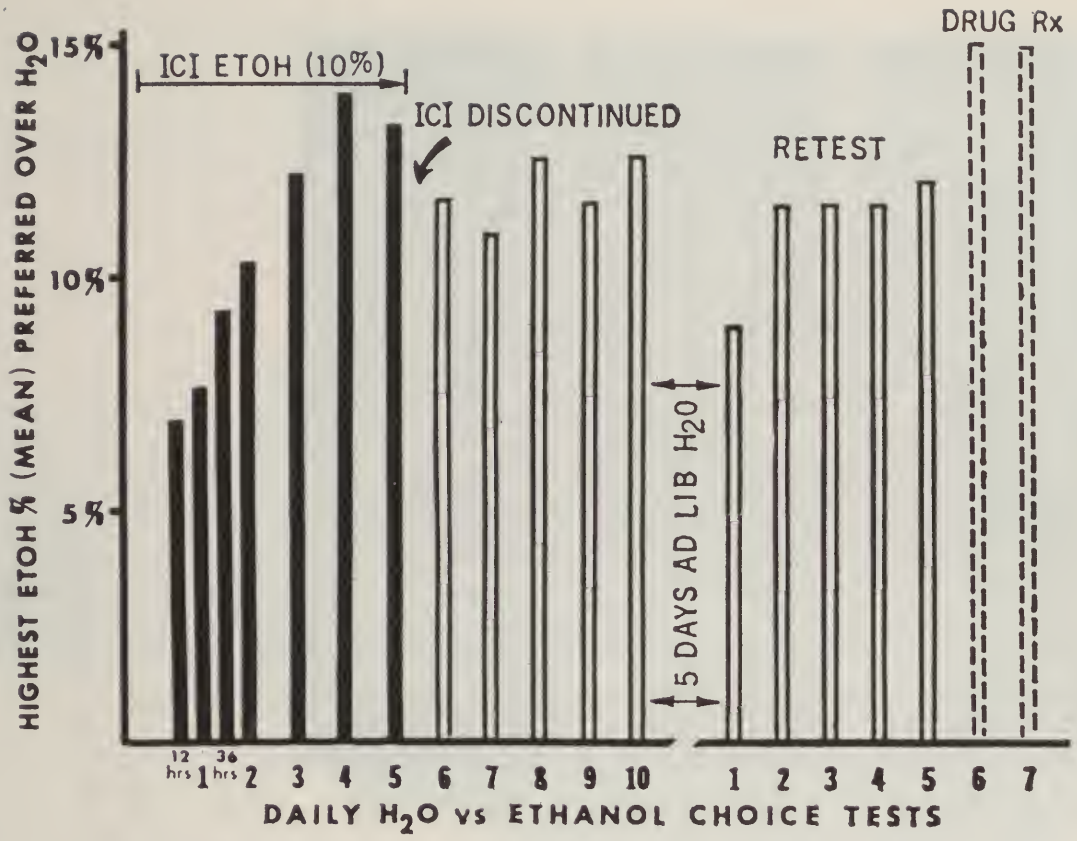

Fig 12

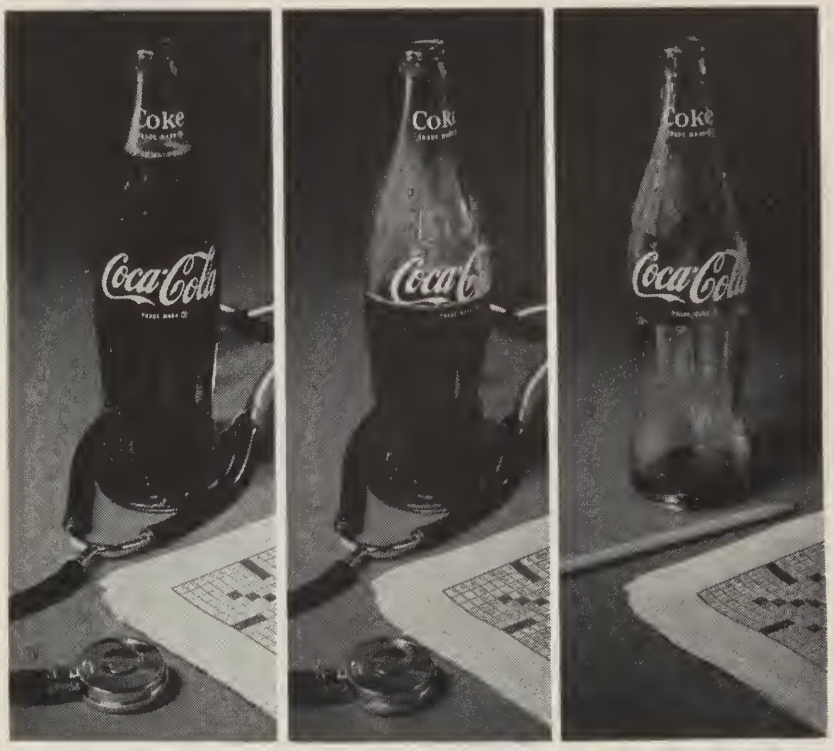
Continued preference for drinking high concentration of alcohol in rats previously infused with alcohol intracerebrally, after the cessation of infusions; and resuming after a five-day total unavailability of alcohol. Tranquilizing drugs (meprobamate and hydroxyphenamate) only increased the oral intake of alcohol.[7]



good"; in other words, a sin, or in the words of the panel tonight, a vice.

Well, it is an intricate matter for me, as it must be for you, to separate out free will from necessity. It always is, and that issue has occupied the minds of many thoughtful men through centuries. But we are doctors, we are physicians, we come from a tradition that didn't ask for the philosophical definition and the moral categorization of suffering before trying to relieve it. Doctors through the ages didn't wait till all the scientific evidence was in, the irrefutable pathophysiology and the infallible remedies, before trying to do something for people suffering from mysterious maladies (and of course all maladies are mysterious, as indeed the absence of malady is).

In our tradition in medicine is a staff with a snake entwined that goes back to Asclepius. I tried to find out whether that snake had a traditional name and what it might be. I couldn't, but I have a notion of what that name should stand for. It is skilled, compassionate responsibility, applied wherever it can be of use and benefit.

Think of our predecessors down the centuries who didn't know that appendicitis existed. They didn't know about myocardial infarction; schizophrenia, ACTH, or desoxyribonucleic acid. They didn't have all our modern advantages: the x-ray, the research lab, the Hill-Burton Act, and the antibiotic, the computer and the administrator, Ben Casey, *Time*, and the *Reader's Digest*. Well, what did they have? Just what we would have if those modern miracles were taken away from us: that staff and that snake. That skill as good as we and our schools can make it. That compassion, the best we self-invested creatures can give. And that responsibility that permits us as trusted, trained, and licensed agents of society to share or take for the patient—and equally for his family—the grave significant troubles and decisions that he and they face.

Those three things: skill, compassion, and re-

sponsibility are what every man needs and asks of us in the hour of his death; yea, and even in the meaningful crises of his life. And if we offer not some portion of these qualities, we be as tinkling symbols.

The scoffers point out what we already know only too painfully: that we doctors can't really quite know what we are doing. But, by God, we do it.

Doctors have always taken account first of the need that we could recognize and then of the amelioration that we might bring. And amelioration is the act that we better become fond of now that "cure" has been lost to us in almost every branch of medicine. So we take account of the need and the amelioration before turning to acknowledge the enormity of our ignorance; and then we—or at least the talented ones of us—turn to relieving that ignorance, just as the rest of us try to relieve the patient.

We go about our work, I hope and I believe, as quietly, as sturdily, and as sensitively as we know how, giving our diuretics, our antibiotics, our tranquilizers; without shrinking, without apologizing, and without insisting on sifting out definitively the moral and ethical aspects of the patient's illness beforehand, when our job is to *care* for him.

I wanted to talk about the vise of alcohol, V-I-S-E. I wanted to ask those who came tonight to join in the search for ways to get back out of that vise all those we can who are now caught in its relentless jaws. And to do it just as urgently and thoughtfully as those do who are exploring for us how those jaws ever closed.

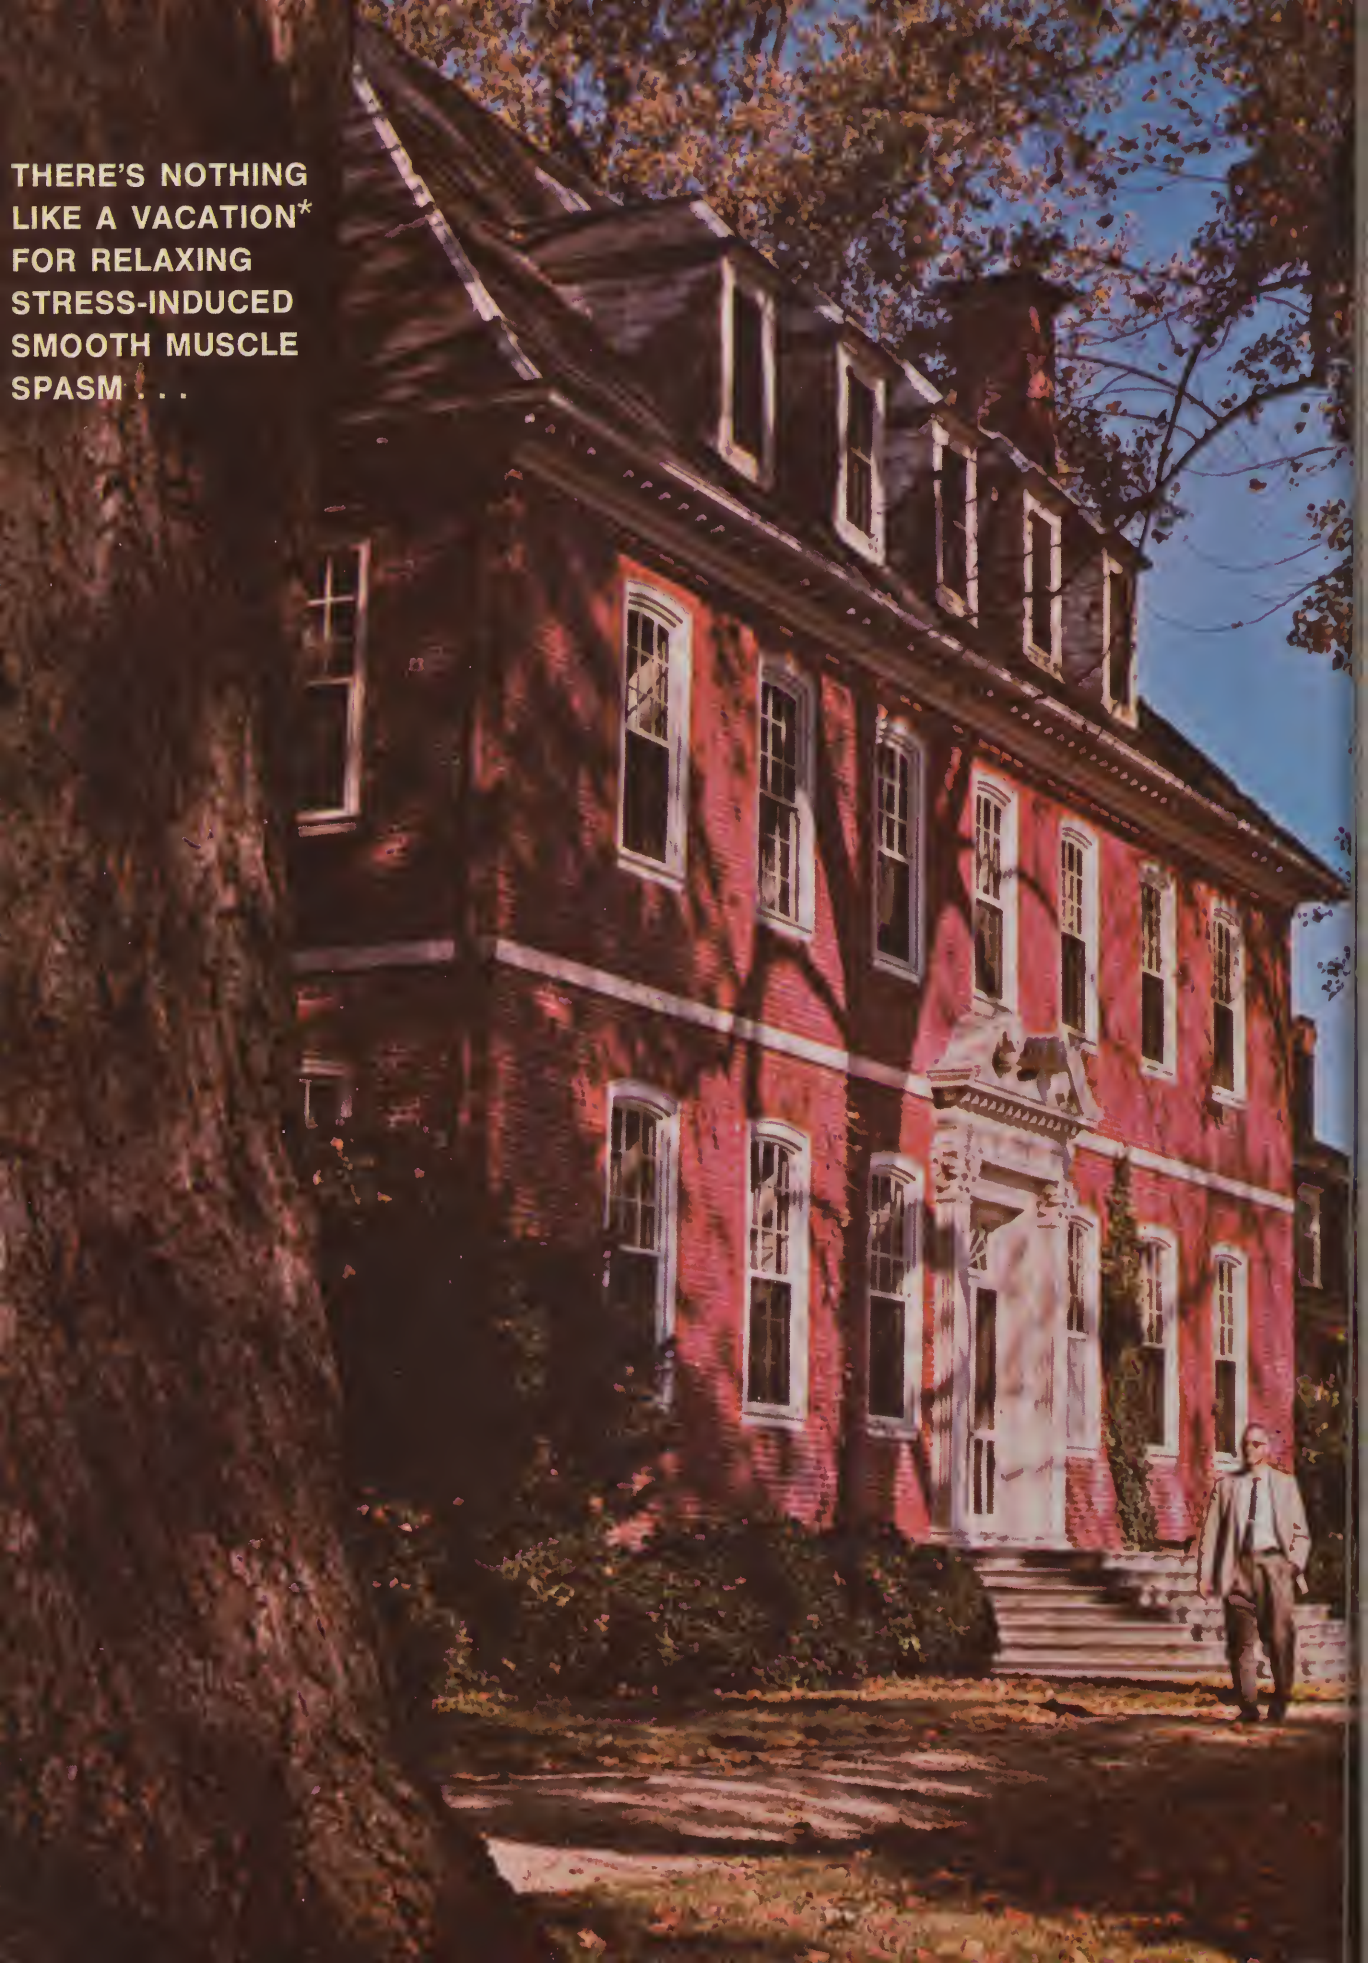
ECONOMY



When you prescribe or recommend Allbee with C, you can be sure your patient is getting a rational, specific multivitamin formulation at an economical price. The potent formula is sensible and simple. It contains therapeutic amounts of the water-soluble B and C vitamins. These vitamins are expended rapidly in the body and need to be replenished frequently. There are no extraneous factors, no frills in Allbee with C. It's the no-nonsense vitamin in the yellow and green capsule that always gives your patient his money's worth.

Each capsule contains: Thiamine mononitrate (B_1), 15 mg.; Riboflavin (B_2), 10 mg.; Pyridoxine hydrochloride (B_6), 5 mg.; Nicotinamide, 50 mg.; Calcium pantothenate, 10 mg.; Ascorbic acid (vitamin C), 300 mg.

—a good reason for 

ALLBEE® WITH C

THERE'S NOTHING
LIKE A VACATION*
FOR RELAXING
STRESS-INDUCED
SMOOTH MUSCLE
SPASM . . .

. . NOTHING, THAT IS,
EXCEPT THE SEDATIVE-ANTISPASMODIC
BENEFITS OF

DONNATAL®

There's nothing quite like a vacation to ease the pressures of the modern, "workingday" world. And for the patient who can't get away from it all, there's nothing quite like Donnatal to relax stress-induced smooth muscle spasm. For 31 years it has been the antispasmodic-sedative most often prescribed for relieving functional disturbances of tone and motility of the gastrointestinal tract.

belladonna alkaloids in optimally balanced ratio

In Donnatal, natural belladonna alkaloids are rationally balanced in a specific, fixed ratio that provides "the greatest efficacy with the smallest possible dose."[1] They avoid the clinical uncertainties of the variable tincture and extract of belladonna, and are considered superior in range of action to atropine alone.[2] Furthermore, they are generally recognized as being more effective than the synthetics for relieving visceral spasm.

phenobarbital for sedation

Years of clinical use have established phenobarbital as one of the most efficient and highly regarded sedatives. In fact, for general sedation it is the drug of choice.[3] In Donnatal, phenobarbital potentiates the spasmolytic effects of the belladonna alkaloids, lessening emotional tensions and checking the neurogenic impulses that trigger GI disorders.

more than 24 indications in PDR

Donnatal has withstood the test of time to become the classic sedative-antispasmodic because of its unsurpassed effectiveness, safety, economy, uniformity of composition, and dosage convenience. Its widespread acceptance and usage by the profession can also be attributed to its versatility in treating disorders characterized by smooth muscle spasm. There are more than two dozen distinct and separate indications for Donnatal listed in the current PDR.

IN EACH TABLET, CAPSULE, OR (5 cc.) OF ELIXIR

hyoscyamine sulfate	0.1037 mg.
atropine sulfate	0.0194 mg.
hyoscine hydrobromide	0.0065 mg.
phenobarbital	(1/4 gr.) 16.2 mg.

(warning: may be habit forming)

IN EACH EXTENTAB

hyoscyamine sulfate	0.3111 mg.
atropine sulfate	0.0582 mg.
hyoscine hydrobromide	0.0195 mg.
phenobarbital	(3/4 gr.) 48.6 mg.

(warning: may be habit forming)

BRIEF SUMMARY: Blurring of vision, dry mouth, difficult urination, and flushing or dryness of the skin may occur on higher dosage levels, rarely on usual dosage. Administer with caution to patients with incipient glaucoma, or urinary bladder neck obstruction. Contraindicated in acute glaucoma, advanced renal or hepatic disease, or a hypersensitivity to any of the ingredients.

Announcing the opening of a new Jobst Service Center

Suite 415, Medical Arts Building, 101 West Read St., Baltimore. Phone 539-0560

Jobst Venous Pressure Gradient Supports are custom made to precise measurements of your patient's extremity. Our service center is staffed with experts who will measure and fit your patient on your prescription only. Each support is individually engineered to exert the correct counter pressure according to your diagnosis and each support is guaranteed to fit, no strangulation, no puddling, no tourniqueting. Send patients to our Baltimore center for measuring and fitting; there is no charge for this service. For complete information have your secretary phone or drop us a card.

GLAUCOMA PATIENTS / A Plan for Improved Management

A central glaucoma testing facility staffed by technicians under the direction of a board of ophthalmologists would facilitate the testing and retesting necessary for proper management of glaucoma patients.

DAVID PATON, MD

The ultimate aim of all investigations of glaucoma, whether clinical or research, must be the improved care of the patient. But little attention is now being given to the practical problem of how every patient with glaucoma can receive the careful, professional scrutiny his disease requires.

As the population enlarges and ages, the prevalence of glaucoma is constantly increasing. There are approximately one million citizens in the United States with glaucoma. Of the quarter of a million persons who are legally blind, about one-fifth have glaucoma. Unquestionably, glaucoma is the most significant cause of blindness in this country; yet a relatively small number of physicians must manage the hordes of patients with this disease.

According to statistics from the American Board of Ophthalmology, there are about 4,600 Diplomates practicing in the United States. Approximately 3,000 non-certified ophthalmologists, or EENT physicians, have clinical practice; and the American Medical Association reports that there were less than 1,000 residents in ophthalmology as of 1962. If all of these physicians are grouped together—the only people qualified to manage glaucoma patients—conservative estimates show that there are between 100 and 200 glaucoma patients to be cared for by each doctor. This number has particular importance when it is realized that glaucoma, like diabetes and heart disease, is a chronic ailment whose course and control must be precisely monitored.

Practical measures for improving management of our country's glaucoma population have not kept pace with present-day knowledge of how blindness from glaucoma can be checked. We know that every patient's intraocular tension should be constantly maintained at normal levels. We know that every patient's visual field must be diligently tested and retested to assure adequacy of tension control. If the patient is not followed closely, with rigorous attention to both intraocular tension and visual field changes, the physician is compromising what he knows to be optimal glaucoma management. The treatment of each patient, whether medical or surgical, must be custom-designed. There is nothing to indicate that glaucoma can ever be managed by predetermined formulas.

Thus, the typical ophthalmologist is confronted by a time-consuming responsibility for his glaucoma patients; yet these cases usually constitute a minor portion of his total practice. Patients with glaucoma may have to wait several months for a routine checkup because the doctor is heavily scheduled in advance. Even then, retesting may be limited to a single tonometer reading and perimetry—inadequate information to assure optimal control.

There are other difficulties, too, in the usual office management of a glaucoma case: visual field charts of one physician are often of no value to a consultant because different testing techniques prevent accurate interpretations. Certain surgeons may staunchly advocate a given operative tech-

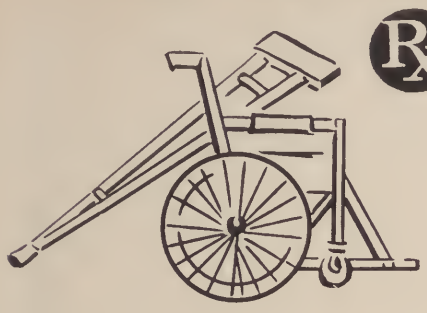
nique without being able to appraise their results objectively in relation to others, because there are no standard criteria for comparisons. The major factors in glaucoma care are the ophthalmologist's time, his particular interests, and the availability and competence of assisting personnel to expedite his studies.

There seems to be no adequate means of assuring optimal nationwide glaucoma management if all the testing and retesting of glaucoma patients is performed exclusively by ophthalmologists. In my opinion, the crux of the problem is the extent to which ophthalmologists are willing and permitted to rely overtly upon technical assistants in performing tonometry, tonography, and perimetry.

In medical teaching centers and ophthalmology departments of various sizes, most testing is performed by technicians under the direction of ophthalmologists. Because of priority clinical-research projects and inconvenient locations of the testing facilities, the services of these technical staffs are generally not suited for large-scale work with routine patients; and even if they were, such services might not be available to patients of ophthalmologists unaffiliated with the parent institution.

Some ophthalmologists employ their own technicians, often a privately instructed nurse; but because of other office duties and the limitation of time available for glaucoma-testing alone, the patient management can be very haphazard when it is not performed according to systematized technique by full-time technical workers. Compromise in obtaining complete re-evaluations is too often an undesirable necessity.

I have been interested in the continuum of glaucoma management. In early 1960, a proposal to establish a community glaucoma facility for the use of practicing ophthalmologists was drawn up and submitted to the Eye Section of the Baltimore City Medical Society. It was hoped that this "testing station" for patients with glaucoma would be a prototype for future affiliated facilities throughout the country, so that uniform standards of technician training and of testing methods could be maintained. The Baltimore facility was to consist of a suite of rooms in a medical office building, near a teaching hospital but completely independent of that hospital. It was to be a nonprofit organization under the direction and supervision of a board of ophthalmologists. The purposes of this trial facility were to be: 1) to obtain a practical method of providing ophthalmologists with complete technical information on the adequacy of tension control in their own patients; and 2) by compiling objective data, to determine optimal methods of medical and surgical control of glaucoma.



According to the plan, the ophthalmologist would send his glaucoma patient to the facility with a card containing basic information for filing, such as the patient's diagnosis, history of ocular surgery, and current medications. At the facility, trained technicians would perform measurements of visual acuity, visual field testing with standardized targets and stimulus intensity, and tonography, with or without a water provocative test, depending upon the request of the ophthalmologist. Originally it was suggested that the facility be prepared to measure diurnal tension variations, but this eventually seemed impractical outside a hospital environment.

The estimated cost to the patient (and indirectly to the doctor) for the technical services of this large-scale glaucoma testing station would be considerably less than if this work were done in a doctor's private office. The availability of the service to every patient with suspected or definite glaucoma would, of necessity, improve the quality of glaucoma care available to the community without detracting from the ophthalmologist's sole responsibility for the management of his case. A duplicate copy of the results of each serial testing appointment would be coded and filed at the facility. This accumulated data would eventually provide a means of valid comparison of large groups of glaucoma patients managed according to varied techniques.

The response of Baltimore ophthalmologists to this proposal four years ago was not sufficiently enthusiastic to establish the facility. The most common objections to the proposed facility were that it did not seem *necessary* (most ophthalmologists apparently consider their present management techniques adequate) and that it would lead to a change in the patient-doctor relationship.

Letters explaining the proposed testing station were sent to several outside experts in glaucoma. Some of their comments may be of interest here. Dr. Bernard Becker wrote, "I am in complete agreement with your overall plan for

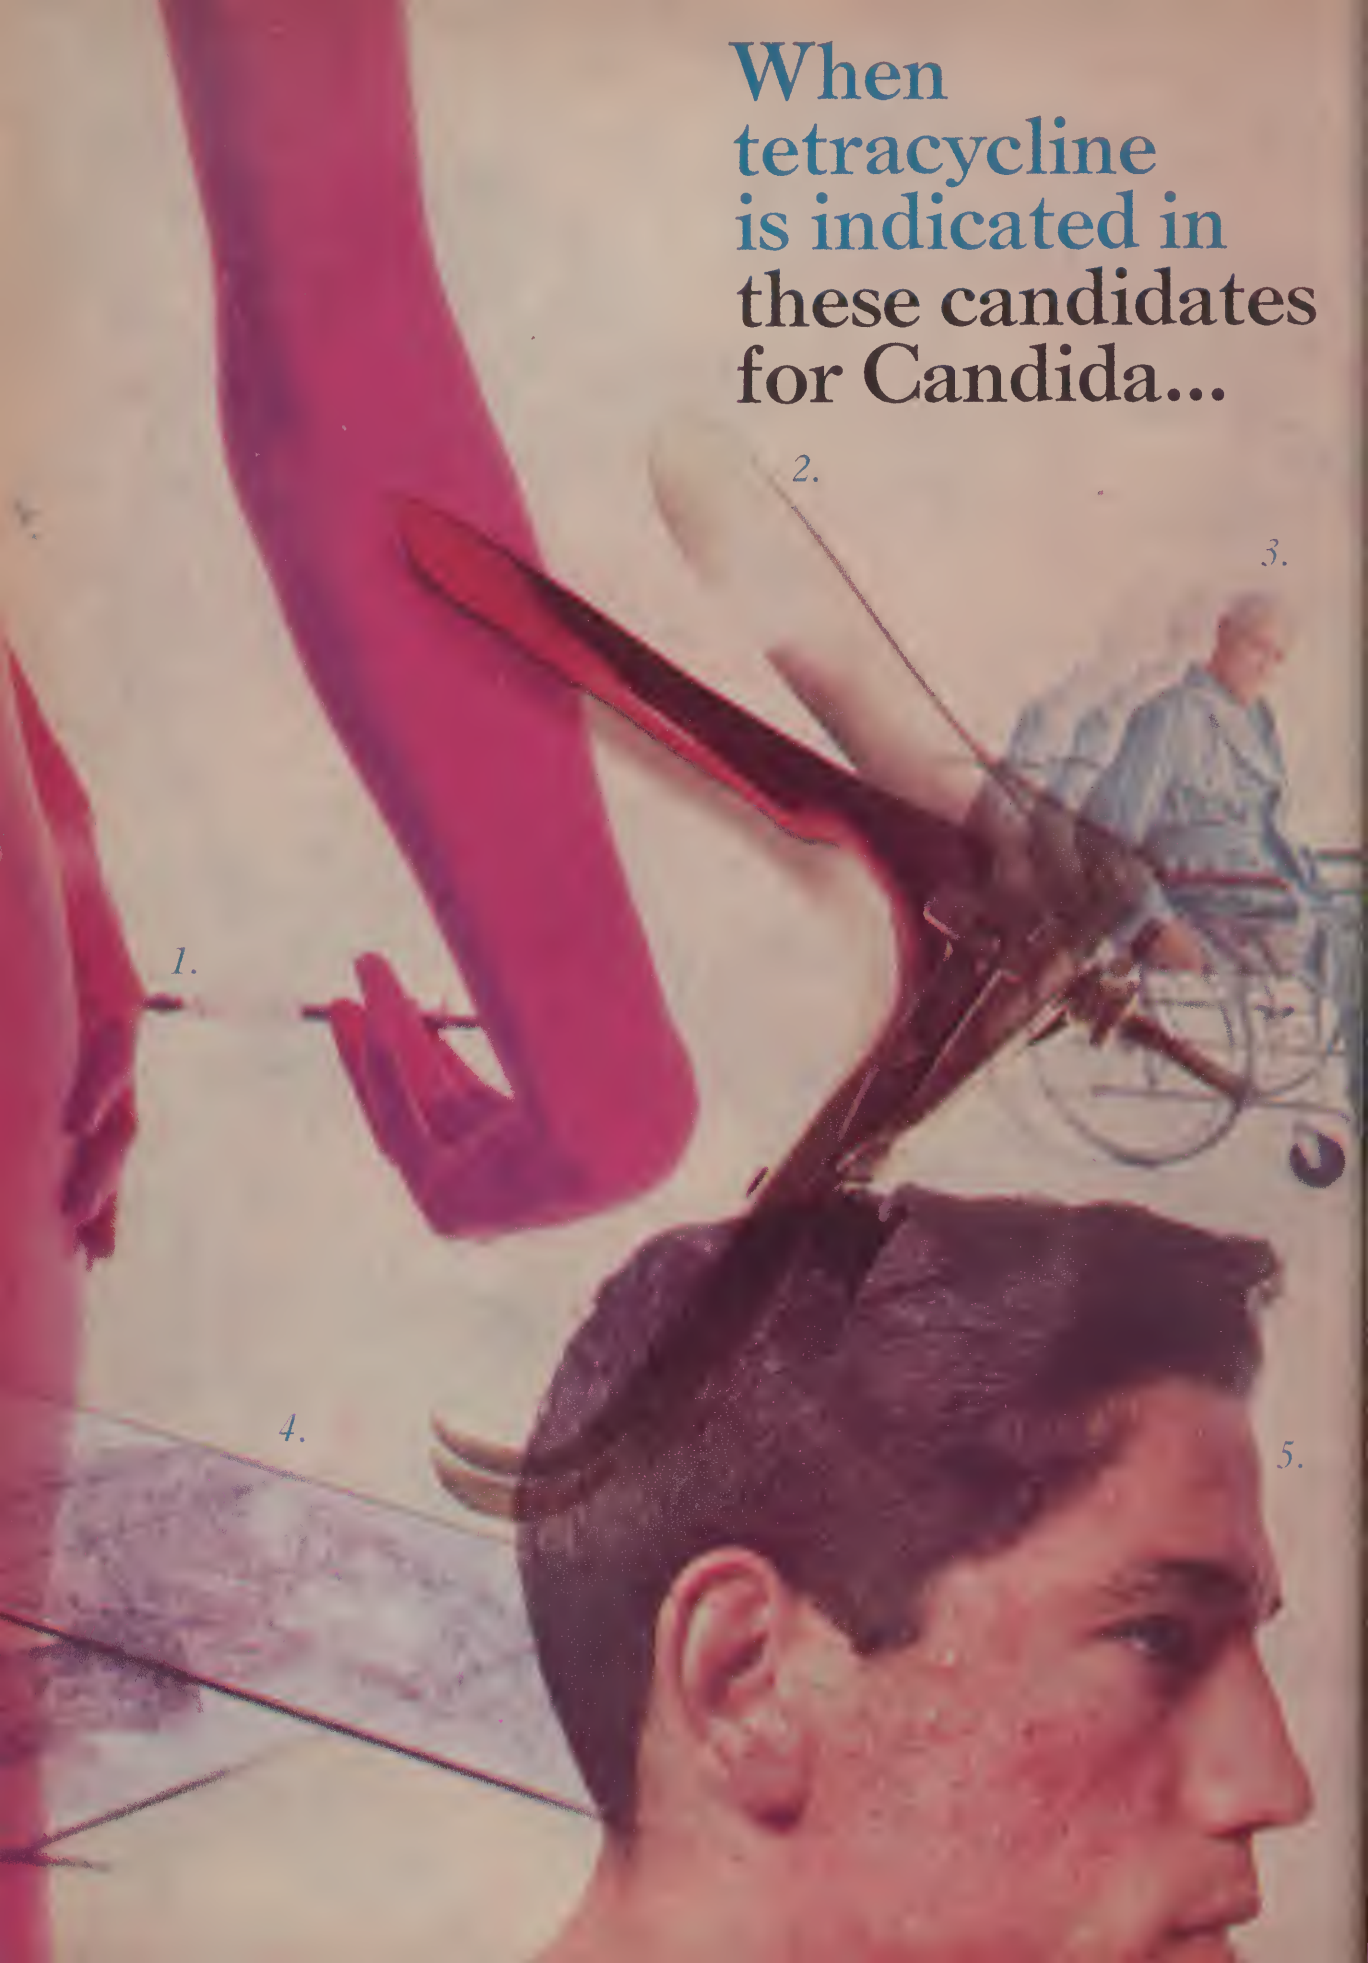
the management of glaucoma patients"; and Dr. Robert Schaffer wrote, "There is no doubt as to both theoretical and practical merit of such a plan as you propose." Dr. Paul Chandler, disagreeing with the emphasis in 1960 on diurnal tension measurements, further responded, "No one knows better than I how poorly, in general, glaucoma is treated . . . If you establish such a center there (Baltimore), you might eventually raise the whole standard of glaucoma treatment in your area, and could do nothing but good." Thus, there was considerable discrepancy between the majority opinion of local practicing ophthalmologists and nonresident experts in the glaucoma field.

There were other major objections raised to the concept of a glaucoma facility as outlined above. One noted ophthalmologist wrote: "I believe that at least in private practice few patients would care to trust the recording of tension to technicians, nor do I feel this should be encouraged." Another commented, "As long as this remains a hospital experimental projection I can understand the value of such an undertaking, but once you begin to hire an office in a downtown building, I can easily visualize commercialization by other groups who would have a perfect right to organize such a checking station."



That last comment undoubtedly referred to a group such as the optometrists, who have a legal eye on what might be permitted to technicians but not to them. *Optometrists must not test for or treat glaucoma.* The pertinent differences between them and medical technicians is that the latter work only under the supervision of the medical profession and do not participate in the medical management of a patient. These medical assistants have become as crucial to the modern ophthalmologist as a physiotherapist is to the orthopedist, or an x-ray technician to a radiologist. It is true that all of these skilled workers are entrusted with potentially hazardous duties. If ophthalmic technicians are legally prohibited, we will be unable to cope with our growing responsibilities for the complete care of each patient that we examine.

In summary, the idea of a separate glaucoma testing facility for a large community depends upon the performance of technical skills by non-ophthalmologists. The interpretation of the test results, the prescription of medicine, and the decisions on medical or surgical management must always be the sole task of the ophthalmologist. So long as the facility proposed here is directed by ophthalmologists, the actual performance of tonometry, tonography, and perimetry by trained technicians would hardly differ from what is now customary in many ophthalmic practices.

It has now been over four years since the testing station idea was proposed in Baltimore; perhaps majority opinion has since changed and the need for such a facility will now be recognized. Once one is convinced, as I am, of the general inadequacy of present glaucoma management, one must concede that there are too few ophthalmologists to perform the continual retesting that each patient deserves.

Practical solutions should keep pace with present knowledge and present needs. Today we turn our thoughts to glaucoma surveys and to basic research; likewise, we must soon design efficient and effective ways to manage, *with optimal medical scrutiny*, the million patients who have this chronic disease.

5.

New low-cost tetracycline/ antifungal therapy

Tetrex®-F

tetracycline phosphate complex –nystatin

Because new Tetrex-F (tetracycline phosphate complex-nystatin) is the most economical therapy of its kind that you can prescribe, it is a sound choice whenever tetracycline therapy is indicated in patients predisposed to monilial infections.

Who are these "candidates for Candida"?

1. diabetic patients
2. nonpregnant women with a history of recent or recurrent monilial vaginitis
3. elderly or debilitated patients
4. patients with a past history of moniliasis
5. patients on long-term tetracycline or corticosteroid therapy.

For these patients, Tetrex-F (tetracycline phosphate complex-nystatin) provides efficient tetracycline therapy against a broad range of infections *plus* protection against superinfection associated with the overgrowth of *C. albicans* in the G.I. tract.

Priced for savings

Tetrex-F (tetracycline phosphate complex-nystatin) is lowest in cost—priced 20% lower than most tetracycline/antifungal products.

BRISTOL THERAPEUTIC SUMMARY
For complete information consult Official Package Circular.
Indications: Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms, in patients with increased susceptibility to monilial infections.
Contraindications: The drug is contraindicated in patients hypersensitive to its components.
Warnings: Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. No cases of photosensitivity have been reported with Tetrex (tetracycline phosphate complex). With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood).
Precautions: Bacterial superinfection may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months.
Adverse Reactions: Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis, and allergic reactions may occur.
Usual Adult Dosage: 1 capsule q.i.d. Continue therapy for 10 days in beta-hemolytic streptococcal infections. Administer one hour before or 2 hours after meals.
Supply: Capsules, bottles of 16. Each capsule contains tetracycline phosphate complex equivalent to 250 mg. tetracycline HCl activity and 250,000 units of nystatin. Oral Suspension, 60-ml. bottle. Each 5 ml. contains tetracycline equivalent to 125 mg. tetracycline hydrochloride and nystatin, 125,000 units.

PROSTATITIS—A review of the changing concepts in the causes and treatment of acute and chronic prostatitis. The physiologic factors in the disease process are delineated. The role of surgery in this disease is clarified, and the relationship of prostatitis to benign prostatic hypertrophy is noted. A brief outline of therapy is given.

PAUL BORMEL, MD

Prostatitis is the cause of many perplexing abdominal, rectal, and genital complaints. It has long been an enigma to both patient and physician because of the many ways in which it presents itself and of the difficulty in treating it successfully.

During a one-year study of chronic prostatitis, Edward Gartman[4] listed more than 178 different symptoms involving every system from the hair of the scalp to the tips of the toes. The usual symptoms, thin, watery urethral discharge, perineal discomfort, and vesical irritability (urgency, frequency, dysuria, and nocturia), are easily recognized; however, the subtle symptoms, such as decreasing libido, feeble erections, and what the patient refers to as the "early morning dew," are becoming increasingly appreciated as due to low-grade prostatic infection.

Etiology

In the earlier textbooks of medicine and urology one finds the statement: "The commonest cause of prostatitis is *Neisseria gonorrhoeae.*" Advantage was taken of this in the old days when a person was a suspect of gonococcus (GC) without a discharge. He was given lots of beer or alcohol to stimulate his gonococcal prostatitis or urethritis to produce sufficient secretions for a urethral specimen to verify the diagnosis.

In recent years the venereal cause of prostatitis has been disappearing from the standard medical text and is being replaced by concepts founded on newer medical knowledge.

Acute prostatitis as observed today frequently begins as an accompaniment of a venereal disease. A young man at the time of the initial contact with the gonococcus organism may also be inoculated with staphylococcus, streptococcus, *escherichia coli,* or any of the host of other organisms present in the vagina. The gonococcus produces an inflammation in the urethra and prostate, allowing other organisms to establish secondary infection in the absence of the protective response of the normal, healthy tissue. The venereal disease is successfully treated with penicillin, but the urethral discharge may continue or subsequently recur several weeks or months later. This is not to be confused with the Mimea infections, which also appear as gram negative diplococci but which can be differentiated culturally

from gonococcal infections (aerobically cultured on E. M. B. agar).

A second source of acute prostatitis, not requiring a precedent venereal disease, is an antegrade urethral infection. This may occur during intercourse when a posterior urethritis is present which originated from a bladder infection. Again, the normal protective mechanism of the prostate is reduced, allowing infection to occur.

Hematogenous spread of infection in most young men is an infrequent source of prostatitis. Although it has a rich blood supply, the prostate is seldom involved in conditions which become systemic to the same extent as the kidney or lung.

Chronic prostatitis is due to an ascending urethral infection, becoming entrenched in the depths of the prostate. It tends to become recurrent and refractory because of the virulence of the organism, inadequate initial treatment, inadequate local tissue response, or fibrosis. Anyone who develops acute prostatitis is subject to chronic prostatitis if the initial response of the prostate is inadequate to cope with the infection.

Prostatic Physiology

The sole apparent function of the prostate is external secretion. The prostate gland manufactures and stores fluids which convey sperm during copulation. There is no convincing evidence that the prostate may also produce hormones. In addition to producing a vehicle, seminal fluid furnishes extracellular foodstuffs for sperm, thus supplementing the intracellular nutritional reserve.[6] The average male secretes 0.5-2cc of prostatic fluid a day, most of which is eliminated with the urine.[3]

Prostatic secretion is primarily a function of androgenic activity (testosterone) and secondarily of chemical and nervous stimulation. Such drugs as pilocarpine hydrochloride will increase prostatic secretions. Stimulation of the hypogastric nerves and the nervi erigentes induces prostatic secretions. According to Hugh Young,[2] it is difficult to clinically separate infections of the prostate from those of the seminal vesicles.

Alcohol causes congestion of the prostate, increasing the symptoms and tendency to "overflow" with secretions. Alyea[2] has suggested that alcohol and irritative condiments may aggravate chronic prostatitis via its irritant effect on the posterior urethra.

Treatment

The principles of treatment of acute prostatitis are:

1. Bed rest
2. Antibiotics
3. Sitz baths
4. No urethral instrumentation, prostatic massage, or intercourse
5. Aspirin
6. Adequate fluid intake
7. Mild laxative

Bed rest and antibiotics are of paramount importance in treating acute infections of the prostate. Sitz baths provide heat to aid healing in the infected, localized site of the prostate. Hot enemas, diathermy, electrical pads, or electrodes in the prostate are alternate methods of obtaining heat to the area of the prostate.

The principles of treatment of chronic prostatitis include:

1. Antibacterial agents
2. Warm sitz baths
3. Avoidance of alcohol, spicy foods and black coffee
4. Prostatic massage
5. Psychological support
6. Frequent intercourse
7. Mild laxatives

Antibacterial agents are used if large accumulations of leukocytes are present. Suppressive doses of nitrofurantoin, 50mg, four times a day; sulfisoxazole, two tablets (0.5 grams) four times a day; or methenamine in the same dosage can be used. Antibiotics will not cure the condition. At best, the infection is simply suppressed with milder agents, since it is a chronic condition. The effect of frequent and changing antibiotics merely increases the resistance of the organism or makes the patient susceptible to the various complications which can occur on long-term antibiotic treatment.

With regard to warm sitz baths, the same comments apply as were mentioned for acute prostatitis. Usually the patient sits in a tub of warm water every night for 20 to 30 minutes. Alcohol, spicy foods, and black coffee are eliminated because of their irritative effect. Prostatic massage should be gentle. Rough handling of the prostate not only will aggravate the condition but also

will cause you to lose a patient from a treatment which he sorely needs.

Psychological support is of paramount importance in the treatment of this chronic disorder. Once the nature of his problem and its chronicity is explained, the patient is able to live more comfortably with his illness. Karl Lewin[5] and Edward Gartman[4] have stressed the importance of the psychosomatic aspects of chronic prostatitis. Although the value of prostatic massage cannot be minimized, the possibility of aggravating a pre-existing psychologic or erratic disturbance which may be focused in or around the prostate must be considered. Prostatic massage is not a substitute for frequent intercourse, which is an integral part of the treatment of chonic prostatitis.

Role of Surgery

Since prostatitis involves the *true prostate*, surgical extirpation is not ordinarily indicated. A radical prostatectomy would be necessary, which carries with it all the risks of a major surgical procedure plus the possibility of impotence, incontinence, stricture, or possible fistula formation.

A transurethral resection usually is not indicated because it would intensify the patient's symptoms unless all prostatic tissue is removed. This is difficult to achieve even by the best surgeon.

Relationship to Prostatic Hypertrophy

Prostatitis and prostatic hypertrophy are independent entities and usually exist in different age groups. A large obstructing prostate gland with residual urine in the bladder may become infected and form microscopic foci of chronic prostatitis. Chronic prostatitis, however, does not require prostatic hypertrophy to initiate the disease process, or vice versa.

Sustained circulatory, respirator and cerebral stimulation for th

Fig. I. Average plasma levels of C-14 radioactivity following oral administration of C-14 nicotinic acid tablets. Key: ▬ Group A, one sustained-release tablet containing 150 mg. C-14 nicotinic acid, ═══ Group B, one nonsustained-release tablet containing 50 mg. nicotinic acid, ▬ Group C, one nonsustained-release tablet containing 50 mg. C-14 nicotinic acid at 0, 4 and 8 hours.

(fewer absent doses by absent-minded patients)

Human volunteer subjects were administered Geroniazol TT tablets with the nicotinic acid component made radioactive with C-14. Plasma and urine samples were analyzed. (See Figures I and II) The radioactive tracer study substantiated the previous clinical evidence that the release of nicotinic acid from the Geroniazol TT tablet produced a gradual rise in plasma levels to a plateau for a total of 12 hours and more.

Such proven sustained activity makes the management of geriatric patients much easier by minimizing the possibility of neglected doses through absent-mindedness or senile confusion. Therapy *can* be continuous on a daily dose of only one Geroniazol TT tablet every 12 hours.

The gradual release of nicotinic acid in Geroniazol TT will provide the well-known peripheral vasodilatation needed in patients with deficient circulation and with a minimum amount (if any) of "flushing." Also cerebrovascular circulation is complemented by pentylenetetrazol, long-established as a cerebral and respiratory stimulant.

Geroniazol TT improves the typical, unfortunate signs of senile confusion. Patients become more alert

ged and debilitated

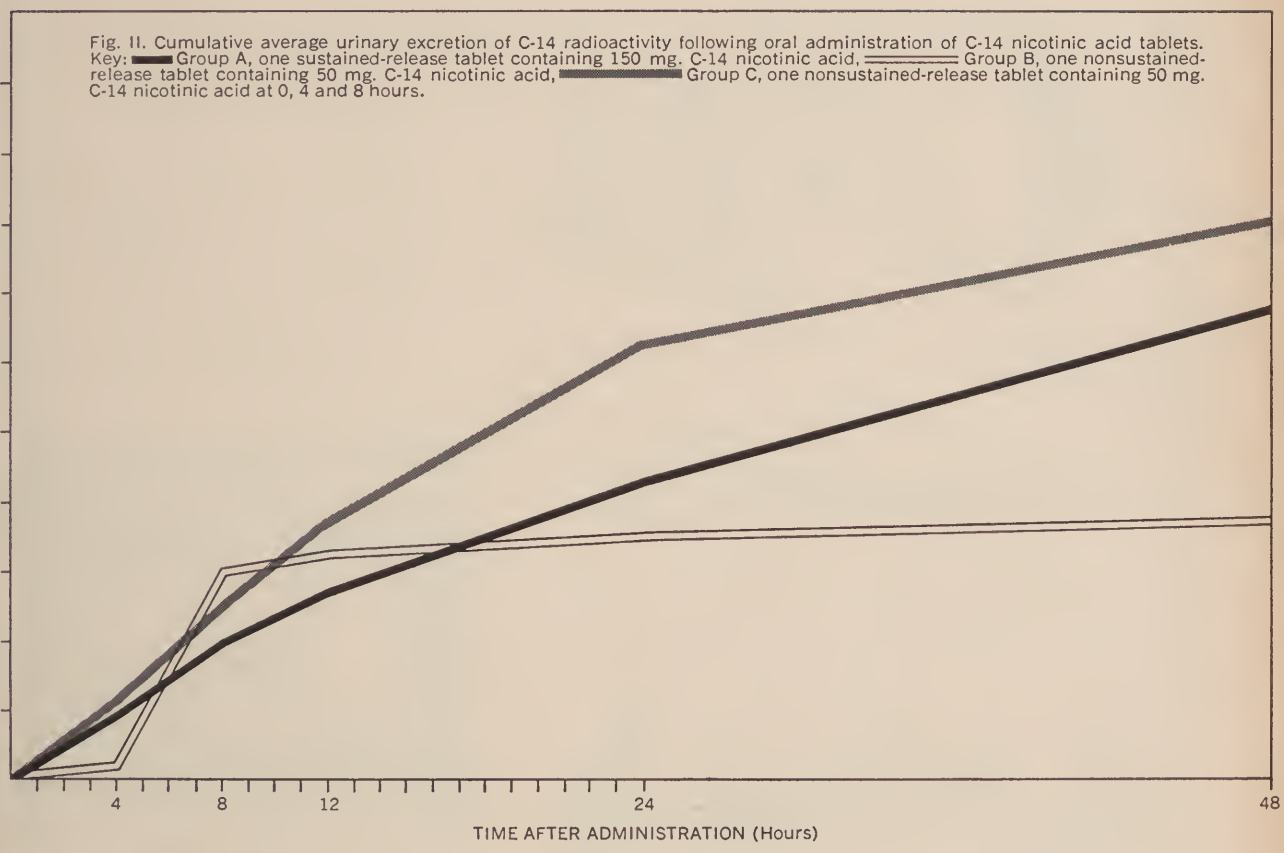

Fig. II. Cumulative average urinary excretion of C-14 radioactivity following oral administration of C-14 nicotinic acid tablets. Key: ▬ Group A, one sustained-release tablet containing 150 mg. C-14 nicotinic acid, ═══ Group B, one nonsustained-release tablet containing 50 mg. C-14 nicotinic acid, ▬ Group C, one nonsustained-release tablet containing 50 mg. C-14 nicotinic acid at 0, 4 and 8 hours.

ess confused and moody. Personal care, memory, motional stability, social attention improve. Fatigue, pathy and irritability are reduced.

A prescription for 100 tablets of Geroniazol TT will ermit your patients to enjoy the benefits of time-rolonged nicotinic acid/pentylenetetrazol therapy, t an economical price. Dosage is only one tablet every 12 hours.

Contraindications: There are no known contraindications.

Precautions: Exercise caution when treating patients with a low convulsive threshold.

Side Effects: Side effects are rarely encountered, however due to the vasodilatation effect of nicotinic acid, transitory mild nausea, flushing, tingling and pruritus are possible.

Dosage: One tablet every 12 hours.

Supplied: Prescribe bottles of 100 tablets, to take advantage of recent price reduction.

The nursing profession has permitted the clinical tradition to decline while attention was focused on education, the development of administrators, teachers, and research workers. The student nurse interested in clinical nursing has no goal of attainment or recognition in clinical nursing. It is proposed that a graduate program or school of clinical nursing be organized within the structure of the school of nursing. There should be a goal of attainment in the field of clinical nursing that will offer a lifelong challenge to the interested, capable, and intelligent nurse.

CLINICAL NURSING

O. C. BRANTIGAN, MD

Thomas Sydenham wrote, "The primary aim of medicine is the care of the patient." The direct immediate care of the sick patient is clinical medicine; it is clinical nursing. Facts discovered and collected by scientific research are important to the sick patient only when properly applied to his particular disease and to his individual variation from normal over and beyond his specific illness. Scientific information must be perused, sorted, and those facts applicable woven into a pattern of treatment that can be administered to the individual patient who is ill. The proper assessment of the condition of the patient and the proper timing of intervention is the work of the clinician; and only the clinician has developed this skill by closely working with sick patients.

The medical and nursing professions have made tremendous strides forward in the past 20 years. In the past decade, because of a twentyfold increase in funds for medical research, research science has been overemphasized with a falling off of attention to clinical medicine.[1–3] The increased work of administering the large research sums of money and the lack of attention to the clinician has led to less effective medical school teaching in the

clinical field. In the nursing profession, there has developed a host of ancillary help: the nurses aide, the ward clerk, the dietetic aid, and so on. This development, though sorely needed, has not freed the nurse for more needed work. It has accentuated the need for the nurse administrator. It is a good example of Parkinson's Law or the rising pyramid.[4]

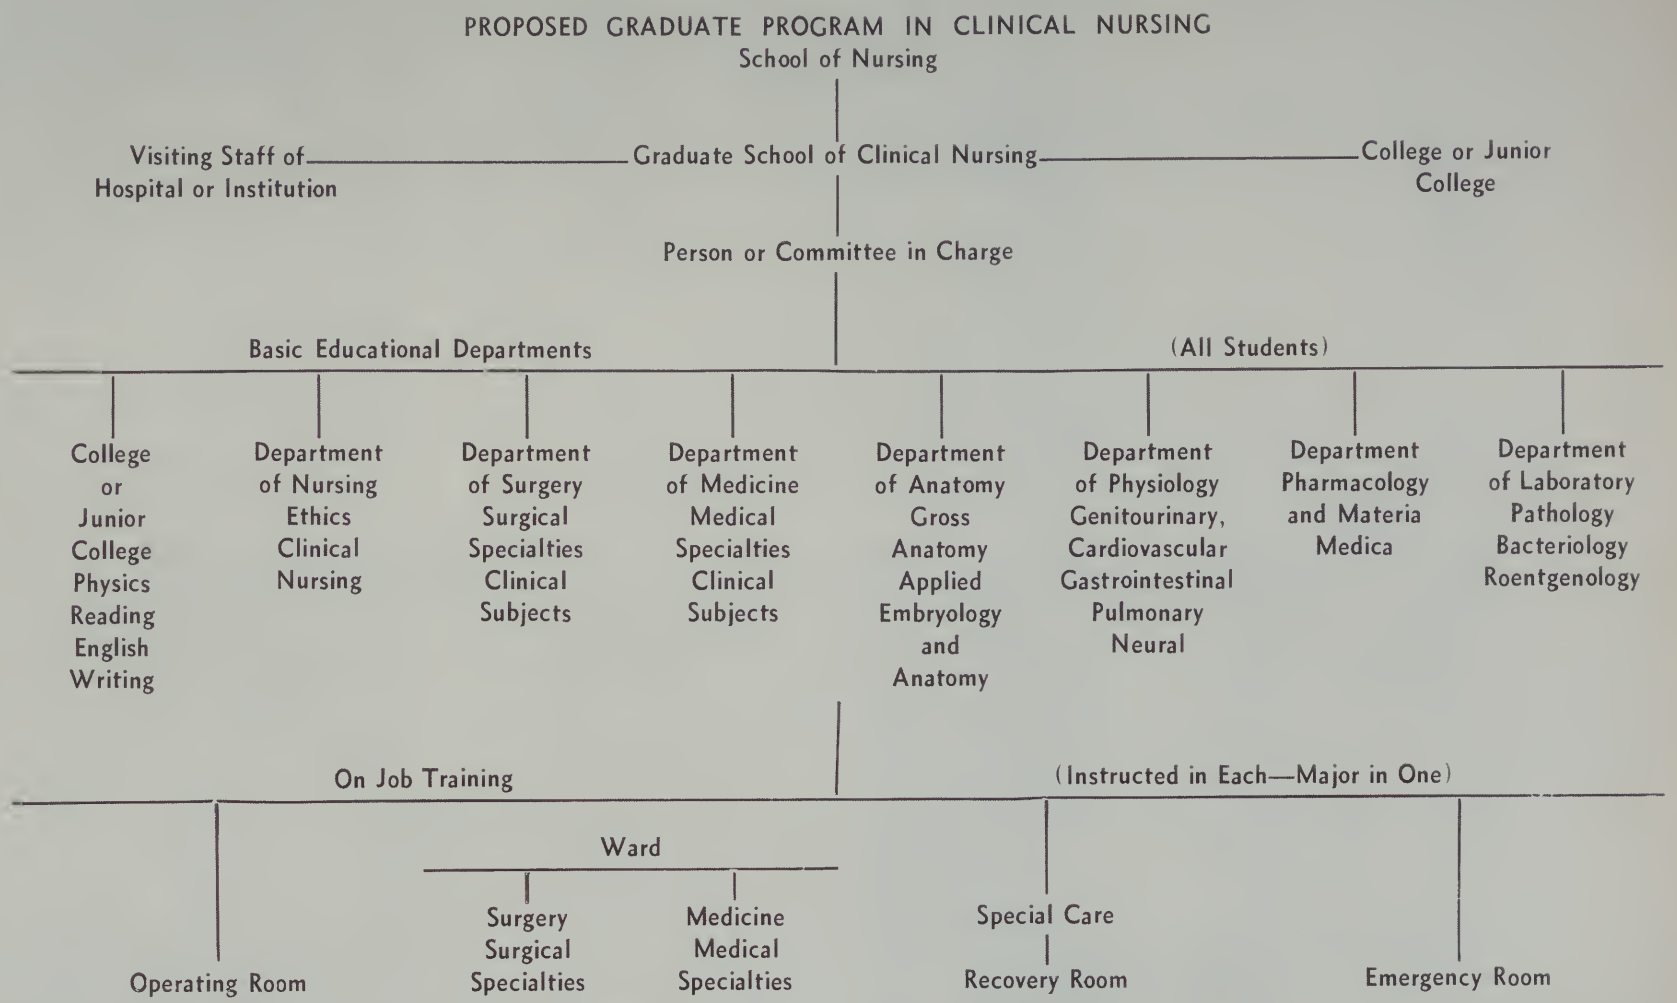
The nurse administrator must continue to supervise the nurses; but, in addition, the nurse in charge of a ward or area must be competent to direct, control, and supervise the group of aides who often are not of the highest intelligence and surely are not dedicated to the work. The nursing profession is to be complimented for the development of administrators with a high degree of skill.

The nursing profession has interested itself in research, and there is promise that great programs will be developed in the near future. The favored word throughout our great nation is *research*. It is to be fostered but not to the detriment of other needed areas of development.

In the nursing profession, much effort has been directed to the development of teachers. Teachers have been developed within their own ranks, and perhaps this has been one of the greatest achievements of the nursing profession. Interest in and the development of teachers has brought about an enormous improvement in the education of the student nurse. It can be seen in the increasing numbers of baccalaureate and nursing degrees that are being conferred and in the increased activity of colleges and junior colleges participating in the teaching of basic science to the nurses.[5]

The general improvement in education is admirable. It makes a better qualified and better oriented nurse. However, the teaching of a clinical nature and teaching of clinical material by the doctor of medicine has been neglected or at least has failed to make advances commensurate with teaching in other areas. With interest of the nursing profession focused upon administration, research, and teaching, the field of clinical nursing has failed to advance. The cause is similar to or parallel to that found in the medical profession in its failure to advance clinical medicine.

The nursing and medical professions are so closely allied that one is completely dependent upon the other.[6] It is folly to believe that one could exist without the other; yet it seems that in the past 15 to 20 years there has been an ever-widening chasm between the two. Perhaps in some way it is related to the failure of both to put proper emphasis upon improving and developing top flight clinicians. It is obvious that the doctors and their organizations should interest themselves in the problems of the nurse. They should help and support the nurse in developing an adequate goal of attainment worthy of the interest and ability of the intelligent, capable nurse and to help the nurse in securing appropriate economic reward for the important work that is done.[7]



Re-emphasis on teaching clinical material to the student nurse and the development of a recognized and well-organized graduate program for clinical nursing might well be the catalyst that will reunite the two professions. The doctors of medicine should participate more actively in the teaching of student nurses and should carry the major burden of teaching in a proposed graduate school of clinical nursing. The renewed association and mutual activity would close any breach in the relationship between the two great professions and would in time draw them into an inseparable amalgamation of purpose and accomplishment.

It would be easy to incorporate more and renewed effort in the teaching of clinical nursing to the student. The development of a graduate program or school for teaching of the art and science of clinical nursing would be more difficult. After many years of study, aided by able clinicians in both medicine and nursing, a skeletal outline of a proposed graduate program or school of clinical nursing is presented in the Table.

The philosophy of the program is to bring capable workers into a system that will provide the best possible treatment and care of the sick patient and, at the same time, provide a fitting lifelong career that will challenge the best efforts and intellect of the capable nurse.

The purpose of the program is to improve the care of the sick patient and to give additional education and training to the capable graduate registered nurse in order that the nurse can, through proper training, exercise greater responsibility in the care of the sick patient, but always under proper medical supervision.

The proposed graduate program must be under the direct control of a recognized (accredited) school of nursing, but doctors in clinical practice should have an important role in the advisory committee or council. It is desirable to have an affiliation with a university, a college, or a junior college. The faculty thus would include a selected

number of teachers from the school of nursing and members of the affiliated institution of higher learning; however, most of its faculty members should be doctors who are engaged in the clinical practice of medicine.

Details of time spent, exact subjects studied, and number of faculty has been worked out and should be variable. The nursing school with its faculty would occupy an important sphere of teaching. The university, college, or junior college affiliation would teach basic physics in order that the student would better understand the complicated machines now employed in the treatment of patients. The student would study reading, writing, and English for the educational advantage and for aid in accomplishing the record-keeping necessary in the new duties.

The departments of medicine, surgery, and their specialties can be enlarged or curtailed as desired. Obviously, the faculty members could be recruited from the doctors practicing in the respective clinical field. The department of anatomy should teach gross anatomy and applied embryology and anatomy from cadavers. Anatomy should be taught by a doctor in the clinical practice of medicine who has a special interest in anatomy. The department of physiology could be outstanding. The subjects should be taught by doctors who are specialists in the respective fields. For example, the specialist in obstetrics and gynecology would teach the physiology of female reproductive organs and excretory system. The specialist in male urology would teach physiology of the male genitourinary system. The department of pharmacology and materia medica would be taught by internists who are especially adept in their use of basic and important medicines. The department of laboratory would be taught by the doctor or doctors in charge of the various areas, such as pathology and roentgenology. In all areas, the teachers will be clinicians expert in their fields of endeavor, and they will keep their instructions on a practical clinical basis, never forgetting that basic knowledge allows variation in practical application. All students would participate equally in the basic subjects outlined.

The on-the-job training areas or departments would be in charge of the regular nursing supervisor and the doctor normally designated as head of the particular area. The teachers or faculty members would be the doctors in clinical practice in the area and nurse teachers especially prepared for the duty. It is in this clinical area that the scope and responsibility of the nurse should be greatly expanded under proper medical supervision and control. The nurse would become an assistant or associate of the doctor in charge of the patient.

It is believed all students should have a brief period in each of the areas, but the student should specialize (major) in one area in order to attain maximum efficiency in the chosen field. It is suggested that the registered nurse graduate from the course be called a clinical associate nurse in the field in which the major study was taken. The details of the subjects taught have been worked out but are too lengthy for a description here. The graduate clinical associate nurses will take up duties in their respective areas of specialization. It seems imperative that the clinical associate nurse be under the control of the supervisor of nurses in the area; however, the doctor in charge of the area must have authority in assigning the duties and supervising the work done by the graduate clinical associate.

The duration of the course of teaching should be one year. It seems impossible to develop a person with adequate skill in less time. Success of the program demands that the graduate must be an able, intelligent, and well-trained person. No other person should be admitted to or graduated from the program.

The entrance requirements should be rather exacting, since it is believed that only the exceptionally capable graduate nurse from an accredited school of nursing should be admitted to the program of advanced training. The quality of the graduate from the program can be controlled to a great extent by the careful screening of those permitted to undertake training.

It seems that any accredited hospital of 300 to 400 beds that has an accredited school of nursing could organize such a program, since the desired faculty and clinical material would be available. If the program is developed under nursing authority there would be assurance that diploma mills could not occur.

The concept of a specially trained capable nurse being allowed to carry out duties and treatments now restricted to the doctor is worthy of honest, deliberate, and exhaustive study, consideration, and discussion.

The following are natural areas for study and discussion. Is the proposal legal? Will it be ac-

cepted by the accrediting agencies, the nurses, the medical profession? Will the nurse shortage be aggravated? Is the program needed? Is the material to be taught the same material that should be taught to the student in nursing? Obviously, many other questions could be considered.

The legality of the increased duties and responsibility of the graduate clinical associate is always uppermost in the minds of administrators and nursing leaders. It cannot be illegal to give additional training to persons qualified to accept training. The doctor who assumes the responsibility of treating a patient will continue to exercise that responsibility. The right (legal) of the clinical associate to administer to the patient will be acceptable so long as the medications and treatment are at the specific order and direction of the physician who is responsible for the patient, even though the care and treatments are in a category not now ordinarily performed by the nurse. Presently, the nurse can and does carry out orders of the responsible physician.

It is fair to presume that precedent and common practice must be seriously considered when the nurse is to be given advanced training to permit increased responsibility. There are schools teaching anesthesia to nurses who, when graduated, administer general and other anesthetic agents. The Johns Hopkins Hospital has a school of midwifery open to nurses interested in obstetrics.

By using increased responsibility, help in the care of the sick or injured patient is now carried out extensively throughout the United States in the office of doctors, in first-aid departments of industrial plants, in the armed services, and in almost 6,000 hospitals without house officers.[8] The responsibility and duties of the nurse serving in these areas are far greater than in the hospitals where there are house officers. A survey in these areas indicate that the nurses permitted to and encouraged to execute increased responsibilities are proud of their ability and work. Satisfaction of attainment is the reason they are working in their particular area. Many denied the right would leave nursing for other more challenging pursuits. However, it is most important to realize that the nurses assuming the increased responsibility in the care and treatment of the sick or injured are doing it under the direction of the physician responsible for the care of the patient. It is also well to realize that these nurses have had no formal or organized training in their field of increased responsibility. The new, intensive treatment wards are capably manned by nurses of this category. The proposed program merely suggests that these excellent and capable nurses be given the opportunity of formal recognized advanced training in the duties they are called upon to carry out in the care of the sick or injured patient. It merely asks for recognition of a practice prevalent throughout the United States. It suggests that these unusual nurses be permitted to do their fine work in the care of the sick patient with the blessings of all concerned. The graduate clinical associate will not be asked or called upon to make decisions except within the confines laid down by a discussion with the physician responsible for the particular patient.

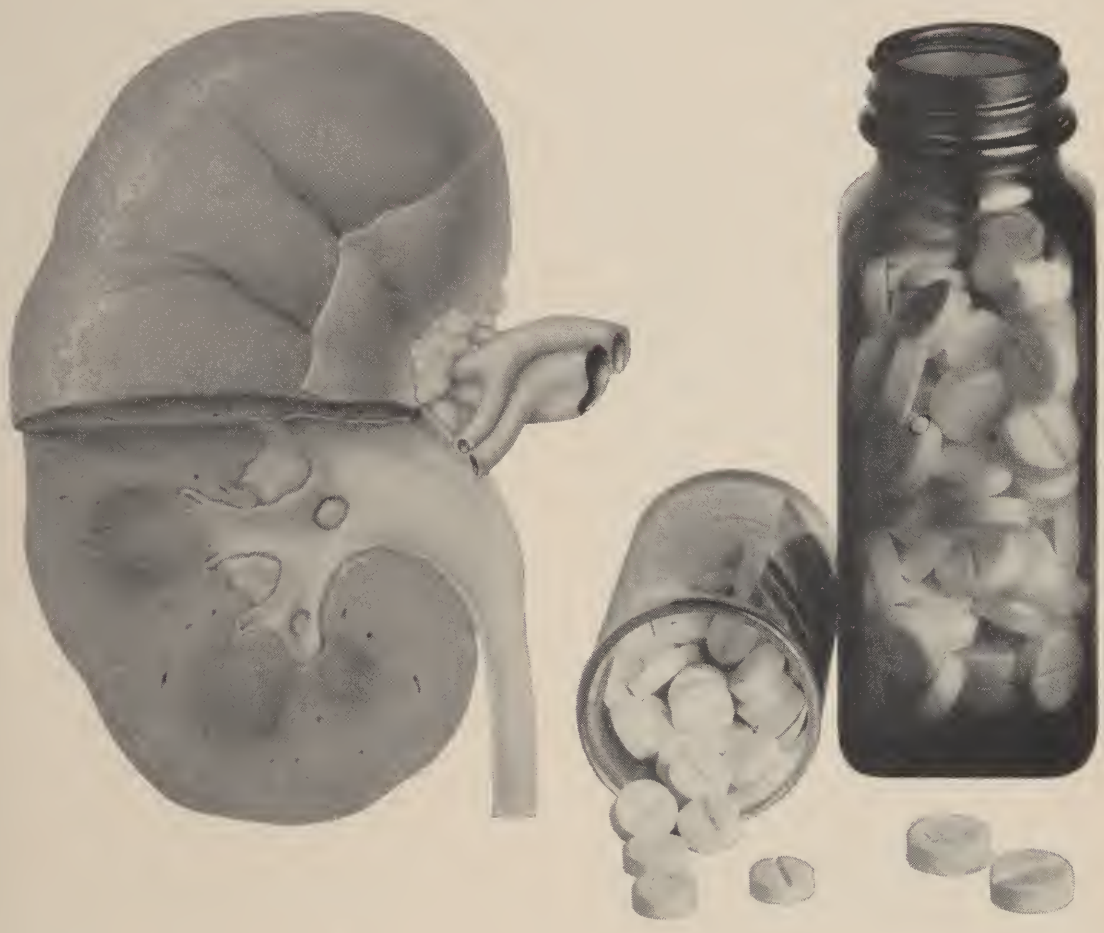
There will be no direct answer to whether or not the accrediting groups will accept the program until a detailed program is drawn up and submitted to the proper organizations; for example, the National League for Nursing, the American Nurses' Association, the Joint Commission on the Accreditation of Hospitals, the Council of Medical Education and Hospitals of the American Medical Association, and to the state and national medical societies. It seems none would object to better training for persons administering to the sick or object to improving the care of the sick patient. In an unofficial discussion with an important council of the American Medical Association, a pilot study of the program was encouraged. Hudson, a member of the Council on Medical Service of the American Medical Association suggests a program of training using basically less able and less well-trained personnel than the graduate nurse.[9]

If the acceptance of the program is further discussed, several important impressions can be brought out. The rank and file of graduate nurses are interested in the program and many are enthusiastic about the prospect of being permitted a greater field of service and responsibility brought about by the opportunity of additional training. The administrators of nursing schools are reluctant to accept the program, but it would be unfair to state that they are not interested. In addition, Francis Reiter has urged that nurses assume more active roles in their relationship to physicians by freely sharing observations, interpreting patient reactions, and offering suggestions for patient care.[10] The method of control of the

clinical associate and the relationship of the regular graduate nurse seems to be a cause for misgivings in the minds of directors of nursing schools. The clinical associate would be on a level with the operating room supervisor or the supervisor of an area, but, when working in an area, the clinical associate would be under the authority of the nurse supervisor, very much the same relationship of a nurse-teacher who works with student nurses on a particular ward or area.

All who are acquainted with the problem of nursing agree there is a shortage of nurses. It is said that the answer to a shortage of nurses is not to enlarge their sphere of activity, thus creating an additional demand upon the already chronic shortage. Such a viewpoint, however, is a short-sighted approach to the problem. If the goal of attainment for the nurse is enlarged to include clinical nursing, and a position in clinical nursing made worthy of the best talent in the intelligent, capable nurse, there will be numerically more and also more capable and intelligent students attracted into the field of nursing. The young person dedicated to helping humanity will be able to enter the noble profession of nursing and know there is a place of recognition and attainment other than in administration, teaching, or research. There will be the rewarding field of clinical nursing. A recognized sphere of attainment in the field of clinical nursing is now practically nonexistent. It is difficult, if not impossible, to know how many nurses drop out of work in the nursing profession because they cannot advance in the field of clinical nursing.

It is interesting to speculate upon the number of professional graduate nurses in the United States and its territories who may or may not be employed in their profession. In 1950 there were 374,584 professional graduate nurses employed. In 1960 there were 504,000 professional graduate nurses employed, of which 90,000 were working part-time.[5] From 1950 to 1960 there were graduated approximately 317,221 nurses.[11–16] The number employed increased 129,400. The increase is only about 41% of those graduated. If one considers those who died and those who retired by becoming overage in the 11-year period, it will roughly amount to about 66,000, or about 21% of the group graduated during those years.[17] Based upon these figures and interpolated for the past years of existence, one can roughly estimate that the group of professional graduate nurses not employed in nursing equals approximately 40% of those employed. Why this large group is not employed in the nursing profession can at best be only speculation. Of 191,925 not employed in nursing when studied by the American Nurses' Association 85.7% were married, while 6.8% were over 59 years of age.[5] Of the group of graduate nurses not employed in nursing perhaps many would re-enter the field of nursing if a program of advanced training in clinical nursing were open to them.



It has been said that if the student nurse were properly taught and the profession properly oriented there would be no need for a special program to develop the specialist such as the clinical associate in nursing. Obviously, this is far from the fact. All student nurses will not have a desire to develop beyond the fundamentals of nursing, and perhaps many are without the native ability to do advanced nursing. A number of student nurses will aspire to become experts in the field of administration or teaching, and the future will see those who will desire to go into research. The plea is to continue the present high standards of education and teaching in nursing and to enlarge the sphere of nursing by providing a field of advanced teaching in clinical nursing.

at Merck Sharp & Dohme...

understanding... precedes development

The development of chlorothiazide and probenecid were events of major importance, but perhaps even more important for the future was the Renal Research Program by which they were developed. When Merck Sharp & Dohme organized this program in 1943, it was expressing in action some of its basic beliefs about research:

• Many problems connected with renal structure and function were still undefined or unsolved. The Renal Research Program would begin its basic research in some of these problem areas.

• From knowledge thus acquired might come clues to the development of new therapeutic agents of significant value to the physician.

For example, the Renal Research Program put fifteen years into this search before chlorothiazide became available. But because these years had first led to a greater understanding of basic problems, the desired criteria for chlorothiazide existed before the drug was developed.

Along with other research teams at Merck Sharp & Dohme, the Renal Research Program continues to add new understanding of basic problems—understanding which will lead to important new therapeutic agents.

MERCK SHARP & DOHME Division of Merck & Co., Inc., West Point, Pa.

where today's theory is tomorrow's therapy

A Key Site of Action of the Protoveratrine A in Salutensin

"The main function of the carotid sinus is regulation of the blood pressure...."[1]

The veratrum component of Salutensin acts here (and in the myocardium), initiating "...a reflex fall in blood pressure through a generalized vasodilation and fall in heart rate."[2]

SCHWENK

This is a logical Blood Pressure Regulator

BECAUSE IT ENHANCES THE BODY'S OWN MECHANISMS FOR REDUCING BLOOD PRESSURE

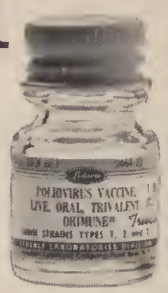
In mild to moderate hypertension:

Salutensin enhances the body's own mechanisms for lowering blood pressure. The veratrum component of Salutensin acts on the carotid sinus and myocardial receptors, initiating "...a reflex fall in blood pressure through a generalized vasodilation and fall in heart rate."[2] To achieve this reflex modification of hypertension, Salutensin utilizes protoveratrine A. In addition, to facilitate and maintain blood pressure reduction, Salutensin incorporates reserpine and a highly effective thiazide. In general, side effects have been reported infrequently but may include those listed in the therapeutic summary.

Simple dosage—low-cost therapy: Many patients on Salutensin respond to 1 tablet *b.i.d.* Long-term economy is assured, since dosage can frequently be lowered after initial control is established.

Available: Prescription-size bottles of 60 tablets.

References: 1. Editorial: JAMA *191*:592 (Feb. 15) 1965. 2. Meilman, E., in Moyer, J.H.: Hypertension, Philadelphia, W.B. Saunders Company, 1959, p. 395.



BRISTOL THERAPEUTIC SUMMARY
For complete information consult Official Package Circular.
Indications: Essential hypertension.
Warnings: Small-bowel lesions (obstruction, hemorrhage, perforation) have occurred during therapy with enteric-coated formulations containing potassium, with or without thiazides. Such potassium formulations should be used with Salutensin only when indicated and should be discontinued immediately if abdominal pain, distention, nausea, vomiting or gastrointestinal bleeding occurs.
Contraindications: Salutensin is contraindicated in severe depression.
Precautions: Azotemia, hypochloremia, hyponatremia, hypochloremic alkalosis and hypokalemia (especially with hepatic cirrhosis and corticosteroid therapy) may occur, particularly with pre-existing vomiting and diarrhea. Potassium loss, which may cause digitalis intoxication, responds to potassium-rich foods, potassium chloride or, if necessary, stopping therapy. Serum ammonia elevation may precipitate coma in precomatose hepatic cirrhotics. Discontinue therapy two weeks before surgery or if myocardial irritability, progressive azotemia or severe depression occur. Exercise caution with patients with peptic ulcers or renal insufficiency (if severe, Salutensin is contraindicated).
Side Effects: Hydroflumethiazide: Purpura plus or minus thrombocytopenia, hyperuricemia, leukopenia, hyperglycemia, glycosuria, malaise, weakness, dizziness, fatigue, paresthesias, muscle cramps, skin rash, epigastric distress, vomiting, diarrhea and constipation. *Reserpine:* Depression, peptic ulceration, diarrhea, Parkinsonism, nasal stuffiness, dryness of the mouth and, with overdosage, agitation, insomnia and nightmares. *Protoveratrine A:* Nausea, vomiting, cardiac arrhythmia, prostration, excessive hypotension and bradycardia. (Treat bradycardia with atropine and hypotension with vasopressors.)
Usual Dose: 1 tablet *b.i.d.*

BRISTOL LABORATORIES
Division of Bristol-Myers Co.
Syracuse, New York

Salutensin®

Each tablet contains: protoveratrine A, 0.2 mg.; hydroflumethiazide, 50 mg.; reserpine, 0.125 mg.

single-dose vials for convenient and economical polio immunization

ORIMUNE® TRIVALENT
POLIOVIRUS VACCINE, LIVE, ORAL SABIN STRAINS TYPES 1,2 and 3

Fast, simple administration—and economy for the patient—make the new 0.5 cc single-dose vial of ORIMUNE Trivalent ideal for private practice. (Packaged 5 to a box with 5 sterilized disposable droppers for your convenience.)
(Also available in 2 cc and 2 drop dosage forms.)

Only 2 doses required for complete, initial immunization for patients more than a year old.

Effectiveness—may be expected to confer active immunity against all three types of poliovirus infection in at least ninety percent of susceptibles only if given at full dosage, as directed. No characteristic *side effects* have been reported. There are, however, certain *contraindications*. These are, broadly: acute illness, conditions which may adversely affect immune response, and advanced debilitated states. In these, vaccination should be postponed until after recovery.

In infants vaccination should not be commenced before the sixth week of life. Do not give to patients with viral disease, or if there is persistent diarrhea or vomiting. ORIMUNE and live virus measles vaccine should be given separately.

Dosage—initial immunization: two doses each given orally at least 8 weeks apart. (Give a third dose to infants at 10-12 months.) Booster immunization: one dose, given orally. See package literature for full directions.

THE LEGAL SOLUTIONS TO PROBLEMS IN DAILY MEDICAL PRACTICE

GEORGE D. SOLTER, ESQ.
MAX R. ISRAELSON, ESQ.
Moderator: RUSSELL S. FISHER, MD

The Good Samaritan Act
Lawyer-Doctor Liaison in Trial Work
Emergency Medical Calls—The Doctor's Liability
Reporting Medically Unfit Automobile Drivers

DR. FISHER: As you probably know, I am Dr. Russell Fisher and will moderate this session this evening. It is a presentation of the Joint Committee of the Medical and Chirurgical Faculty and the Bar Association of Baltimore City and the Maryland State Bar Association. This committee, which has been in existence now for 12 or 14 years, is divided into three subcommittees: the one on Interprofessional Relations, the one on Court Procedures, and the one responsible for your evening's entertainment—I hope—the Subcommittee on Symposia Management. The chairman of the overall committee for the legal side is Mr. Theodore Waters and for the medical side, Dr. John Classen. Your panelists this evening are Mr. George D. Solter and Mr. Max R. Israelson.

Mr. Solter is a Baltimorean, educated here in primary schools, at Johns Hopkins University, and in law at the University of Maryland. He was assistant state's attorney for some four years, from 1950 forward, and then retired from this post to enter trial practice, in which he has been engaged since 1954. He is a partner in the firm of Due, Nickerson, Whiteford and Taylor, and we will direct specific questions to him as time goes on.

Mr. Max Israelson is also a native of Baltimore. He also was educated in the primary schools in Baltimore, spent some time at the University, and studied law at the University of Baltimore. He is a member of the City, State, and American Bar Associations and former national chairman of the Personal Injuries Section of the National Association of Claimants Counsel of America. He is a former president of the Maryland Plaintiffs Bar Association. He is a member of the Joint Committee on Medicolegal Problems, which sponsored this whole series of meetings. He served as assistant city solicitor when the late Judge Simon Sobeloff held the post of city solicitor; is in the private practice of law in the city.

The subjects to be discussed are listed, and without further ado, we will get directly into the business of the evening. We will not follow the exact order in which you see them printed, but I will start it off by asking Mr. Solter about the Good Samaritan Act, which the legislature passed and the Governor signed in a recent session.

Would you define this act and state what effect it has on the doctor's obligation to render aid at the scene of an accident and his liability for alleged negligence on rendering such aid.

THE GOOD SAMARITAN ACT

MR. SOLTER: First of all, I am sure most of you have some idea what the Good Samaritan Act or law is. To state it simply, it is a law that is designed to free the physician from liability when he stops in good faith to render aid in an emergency.

One might ask why it is necessary to have such a law. Contrary to public belief, it is not because there has been a rash of malpractice suits

Medicolegal symposium presented May 9, 1963. Arranged by the Joint Committee on Medicolegal Problems.

directed at doctors under such fact situations; it is more the fear that such would be the case that has made it necessary for several of the legislatures in the country to consider whether such an act would be advisable and helpful as a matter of public policy generally.

Since the end of the last war there has been in this country a marked increase generally in malpractice claims and suits. I am not referring now to the emergency aid situation that we are dealing with, but in a general sense there has been an increase of about 14 per cent, according to the American Medical Association. As a result of this, most doctors—29 per cent, according to a survey of the Association—have covered themselves with some form of liability insurance, in varying degrees of coverage, in the event they are sued or claim is made against them on the basis of malpractice.

Of course, the continued growth in the number of malpractice claims has caused an increase in the insurance premiums, and in some instances, in some areas, which I believe Mr. Israelson will discuss with you, it has been a considerable hardship, because it seems that there is some sort of geographical character about these malpractice claims and suits and causes the premiums to go up. Yet they are affected generally, although most of the claims are in certain specific areas of the country.

Research indicates that actually there are very few claims that arise out of emergency care rendered by a passing physician at the scene of an accident or in some other circumstance where the normal doctor-patient relationship would not have an opportunity to exist.

The increase in claims in malpractice suits has brought about an awareness on the part of doctors which has, in turn, generated in them a fear that they should not stop and get involved. They fear that they will be charged with a hasty and incomplete examination, with improper treatment, with a failure to follow an accepted or standard procedure in a given situation, with assault and battery for failure to obtain consent, and with not following a case to a conclusion. After the doctor renders aid, the ambulance arrives and takes the patient off to the hospital, and the doctor doesn't follow up, which would seem perfectly natural once he is in the hands of an attendant or at least delivered to the emergency room. But doctors have been sued for failing to follow a case once they have undertaken to treat it.

There are valid reasons for their fear, I think. Some fear that the lack of proper equipment at the scene of an accident will hamper them; they fear that under the circumstances, they will have to exercise an immediate matter of judgment on a situation that they are not totally familiar with; or they fear that perhaps their own specialty has not equipped them, since the days of medical school, to handle the situation they may run into at an emergency.

There is some opposition to this law even among lawyers. They fear that perhaps this law sets up a special shield for doctors, whereas it does not pertain to a lay individual. Doctors are being protected in a situation where they above all are more equipped and ready to handle a situation than a lay person would be. In substance, they feel that the law should read "any person," and not just doctors, who stops and renders aid should be protected by the statute.

The pressure of this problem in the last few years has culminated in the passage of statutes of this type in 15 states. There may be one or two that have passed it in the last few months that I have not been able to pick up, but at the beginning of 1963 there were 14; and I know that Maryland has now joined the list.

The California statute was the first one to be passed, in 1959, and is the forerunner. It really is the simplest, and I will read it.

> No person licensed under this chapter who in good faith renders emergency care at the scene of an emergency, shall be liable for any civil damages as a result of acts or omissions by such person in rendering the emergency care.

When it refers to "no person licensed under this chapter," it is referring to doctors, nurses, and the like under the medical chapter of the California Code. That does not mean any person generally.

In 1961 and 1962 the other states followed along. They vary in the actual wording and context of the statute, but basically most of them follow the California pattern. In Maryland, in 1963, the legislature passed Senate Bill No. 117, which the Governor has signed and which will become effective on June 1, 1963.

That statute reads as follows:

> A physician licensed to practice medicine by the Board of Medical Examiners of the State of Maryland, who in good faith renders medical aid, care not in a hospital, and assistance, for which the physician receives no fee or

compensation, at the scene of an accident, shall not be liable for any civil damages as a result of any professional acts or omissions by him, not amounting to gross negligence. In rendering such aid, care and assistance, the physician shall have the defense against any action not amounting to gross negligence, for negligence or malpractice brought against him because of any professional acts or omissions in the rendering of such care, aid and assistance.

Right off the bat you see that our legislature has inserted an exception in the form of gross negligence. In other words, you are protected from ordinary negligence but not from gross negligence. This opens up a big area of what is gross negligence. All I can do is tell you what our Court of Appeals has said about it and define it. Usually it comes up in connection with the operation of a motor vehicle or some other instrumentality that is capable of rendering harm and injury. Nevertheless, for what it is worth, these are some of the definitions that have been given for gross negligence.

It is the omission of that care which even an inattentive and thoughtless person never fails to take of his own property. It implies malice and evil intention. Gross or criminal negligence is a wanton or reckless disregard of human life.

The word "wanton" means characterized by extreme recklessness and utter disregard for the rights of others.

Conduct to be in reckless disregard of the safety of others must not only be done with the knowledge of the risk involved but with perception of the extent thereof and realization that the conduct involves a high degree of probability that substantial harm will result from it. An attempt to discharge a high moral duty cannot be termed negligence unless the actor's conduct exhibits such a reckless indifference to danger as amounts to rashness entailing almost certain injury.

That last sentence, I think, certainly should apply in the case we have been discussing. Frankly, I think this whole thing is a big tempest in a teapot that his been grossly exaggerated. Records of the courts and the medical societies show there are very few instances where any such claims have ever been brought, and yet these statutes have been brought about because of a fear on the part of doctors that they will be brought.

Perhaps the statute will relieve the minds of some at least while in Maryland. I don't know whether they will have any list they can check as they pass from one state into the next to make sure they can stop in West Virginia, for instance, and help somebody or not. But suffice it to say, in my humble opinion, I think the need for the law is greatly exaggerated; but since it has now come on the statute books, I think it is probably one of those laws that eventually should be turned over to the American Bar Association for conformity so that it would be uniform in all states.

If anybody is interested in a capsule comment on the subject, I suggest you read the May issue of *Reader's Digest*. There is a fairly short and concise article on the point there.

DR. FISHER: Mr. Israelson, would you like to comment on this act.

MR. ISRAELSON: Mr. Solter has covered it most thoroughly. The only note I would make on it would be to try to give a practical illustration of the remoteness of any charge or claim under this act. When Mr. Solter defined gross negligence so well, that was the legal definition. To give an idea of how it applies in law, manslaughter by automobile calls for proof of gross or wanton negligence. In Maryland, while we have roughly 400 to 500 motor vehicle fatalities in the course of each recent year, the ability to prove wanton or gross negligence is so very difficult, even in cases of the worst and most flagrant abuse of the law —such as drunken driving and driving at tremendously high speeds—that there are rarely more than possibly one, two, or three convictions in any of those cases in the course of a year.

My understanding is that the American Medical Association in one recent publication indicated there were only approximately four, five, or six of these claims throughout the whole country. I agree that it is somewhat of a tempest in a teapot, but now the medical profession is fully protected.

REPORTING MEDICALLY UNFIT AUTOMOBILE DRIVERS

DR. FISHER: Mr. Israelson, to move to the next question, it is commonly stated a significant percentage of all accidents are caused by medical disability on the part of drivers. Without debating that, would you assess for us the doctor's duty and his liability in reporting possible disabling disease in his patients to the Commissioner of Motor Vehicles. And would you carry this a little further and suggest what combined efforts on the part of our two professions you would like to see brought about in order to better protect the public in this regard.

MR. ISRAELSON: The reluctance of doctors to report medically and mentally disabled drivers to the appropriate authorities is understandable, principally reflected in the starry-eyed light of youth and of the relatively early age at which they take the Hippocratic oath, which forbids

them from divulging the communications of their patients. However, this reluctance should be weighed against the doctor's duty to the public and to the patient and, secondly, to the lack of any liability for so reporting.

Taking those two in reverse order, commenting shortly on the lack of liability: in common law, physicians, when called upon to testify as witnesses, could not decline or refuse to disclose any information on the ground that such information had been communicated to them confidentially. While this condition of the law has been looked on with disfavor by distinguished judges and by the profession generally, some of the states have enacted statutes making the communications between doctor and patient confidential. Maryland is not one of those states.

In Maryland, following the common law, doctors in court, in nonjudicial proceedings—in fact, in any others really short of slander or libel, which is of course handled under a different category—none of these really have a legal liability for divulging patient information. Basically, then, any reluctance would go to the problem of ethics.

I think that should be weighed against the duty that I spoke of, both to the public and to the patient. In the last few years the public has been keenly alerted to the physically impaired driver. Many of the magazines and newspapers have reported episodes in which a physically impaired driver has been the cause of an accident.

Time Magazine, May 3, 1960, reported the findings of Dr. Nelville Murray, a Scottish-born psychiatrist, in San Antonio, who first spoke before the American Psychiatric Association about a peace-of-mind drug that resulted in drivers' actions bringing injury to both themselves and to others.

Wide press coverage was given to pep pill abuse, from benzedrine to amphetamine. In one instance, a truck-bus crash in or near Tucson, Arizona, resulting in the loss of nine lives, was traced directly to such use, according to the report of the investigators from the Interstate Commerce Commission.

News Week, in a recent issue, gave front page coverage to a Pennsylvania law requiring applicants to present health certificates from doctors and, following that, under a new program which I believe has already been instituted in that state, organized and developed by the state secretary of health, Dr. Charles L. Wilbur, and a medical advisory committee, Pennsylvania plans to require all drivers to have periodic health examinations every ten years up to the age of 60 and every five years thereafter.

Currently Maine, Delaware, Illinois, Indiana, New Hampshire, the District of Columbia, and possibly some others in the most recent enactments of the legislatures, require complete re-examination upon renewals of driving privileges at certain ages, usually 65 or 70.

It may interest the doctors in the audience to know that one alleged authority on the subject, speaking of doctors as drivers, claims they are the most inept, irresponsible, and unprofessional of all driving license holders; their minds are elsewhere, on life and death matters; they constantly worry about finding a parking space; they are always in a hurry, rushing to a sick patient or to a hospital.

I would like to interpose a defense on behalf of the doctors. I don't think they are any worse than the average driver on the street, and probably a little better. I just feel that they are a little more conspicuous and more easily identified by the MD or the blue cross on their cars when they happen to make a driving faux pas.

The state of Connecticut was recently chosen by the United States Public Health Service for a study to determine the relationship between the health of drivers and traffic accidents. They arranged a 43-foot mobile unit, a trailer, to move around the state as an examination center. It will be used for the performance of ten different health checks, chiefly for hearing and visual impairment, diabetes, anemia, heart and lung diseases, and even driving aptitudes.

In 1958 the Florida State Department of Public Safety examined more than a half million people in that state and found that approximately 11,000 —these are drivers already licensed—failed to meet visual requirements; 31,000 needed glasses; and more than 1,300 needed special car equipment to provide for safe driving with the physical disabilities that they had. The examiners referred many persons to doctors as part of the program. Investigating certain specific accidents they had on record, more than 11,000 license holders were told to report for re-examination. Out of this group 900 failed to pass the examination, and

their licenses were taken away. About 1,200 were restricted to glasses, and 216 of these re-examined people were required to get the special equipment to enable them to drive safely.

In that same group, 800 medical reports from the medical society of Leon County were received concerning drivers suffering from epilepsy, heart attacks, diabetes, blackout spells, and alcoholism. A recommendation is being made making it mandatory for doctors to report drivers in those categories who they know to be driving automobiles.

The *Journal of the American Medical Association* recently reported a grant of $809,000 to the Harvard University, Department of Legal Medicine, for research on fatal highway collisions.

Recent medical studies show that bus and truck drivers suffer beyond the average from ulcers. The stress and strain of operating big equipment over the highways and on the city streets for long intervals and meeting pretty steady deadlines and schedules produce strains in these men apparently manifested by ulcers. When you think of that as being accompanied by the usual symptoms and evidence of this disease of abdominal pain, weakness from bleeding, the necessity for special diet, these symptoms hardly lend themselves to efficient and safe driving. Stomach cramp or spasm, anything that may cause a momentary inattention to the wheel and to what is ahead of them can follow; and of course it only takes a moment for an accident.

Sedatives, tranquilizers, pep pills, and similar drugs all add to the fatal statistics on the highway.

So much for the realization of it. The AMA's Committee on Medical Aspects of Automotive Safety discussed these points and passed its opinion. First, a physician should not determine what physical or mental conditions render a particular patient an unsafe driver. The examining physician should furnish only specific clinical information with respect to pertinent specified conditions. The determination of whether or not the patient is an unsafe driver should be left to the motor vehicles administrator. The administrator should avail himself of competent medical advice.

Several states have attempted to establish these criteria, but the responsibility, in the opinion of this committee of the American Medical Association, is that the doctor should report the medical facts. He need not assert his own opinion that the patient is or is not an unsafe driver, but they believe he has an obligation to report them to the motor vehicles authority. In Maryland that authority is the Department of Motor Vehicles.

I inquired at our department and was pleasantly surprised to find that they have a routine which lends itself to this very recommendation. They have a medical advisory board which meets twice weekly. They have 15 doctors on whom they call to attend these meetings. The number at each meeting is five. Usually these are distributed among the following specialties: neurology, psychiatry, internal medicine, surgery, and orthopedics. They then have the license reviewers, of whom there are six, and a Mr. Robinson. One of the six hears only medical cases. He advises that up to now the doctors bear out this reluctance to report; but he is hopeful, with the assurance that it not only implies no liability on the doctor but really calls for a duty on the doctor's part to do so, that more doctors will feel inclined, when they come upon these people with any disease or any disability that would make them a danger on the road, to call the Department of Motor Vehicles. Here is what would then happen.

Typically, someone will call and say, "My father is now of an age and has such a condition that he should not really drive a car. We are fearful for his safety," and of course they really mean they are fearful for his safety and the safety of others. When that happens, the DMV communicates with the person and asks him to report to their headquarters. The person is then interviewed by Mr. Robinson. He tries to elicit all medical information that might be helpful in appraising him. He gets the person to sign an authorization for release of information from his doctor or from a hospital and forwards this to the medical advisory board for review. If he feels there is an imminent danger, he will suspend that license immediately, pending review and decision by the board. If the medical board wants to see the man himself or examine him, they will call him for that purpose.

This board's recommendation to the reviewer, Mr. Robinson, is only advisory, but this advice is almost always followed. If it is suggested that his license be revoked, that is done. I think that this is a great step toward getting unfit drivers off the road.

One of the most recent public relations or advertising projects that I have seen on the billboards is: "Drive as if your family were in the other car." I think it is an excellent slogan.

I think this follows the same theme, that it is the duty of the doctor to report these people and to let a medical advisory board decide whether the highway statistics cannot be lowered by getting disabled drivers and dangerous drivers off the street.

DR. FISHER: Mr. Solter, would you take that briefly.

MR. SOLTER: Just a couple thoughts occurred to me. Apparently the system now in effect here is sort of a voluntary one and probably comes up in connection with compulsory re-examination of drivers under certain circumstances. For instance, when there is a fatal accident, the driver, whether he is at fault or not, has to be reviewed. With the compulsory re-registration of drivers periodically you have to answer certain questions, I believe, on the application, such as whether you have epilepsy, are subject to coronary, and so forth. As a result, these things come to the attention of the commissioner more or less on a voluntary basis, or where the driver himself furnishes the information.

I think the answer probably is eventually a matter for the legislature in a statute that would set up certain requirements whereby doctors would have to report these various specified conditions without opinion as to whether or not they affect the driving, and then have a board established with the power to make recommendations with some sort of appeal provision for the driver.

You can see that this would be a serious thing for a person who must drive in order to make a living, so there must be adequate safeguards of the private interest as well as the public welfare.

You may have noticed in the paper a night or two ago an article telling of a car having gone through a wall right into a building. The caption under it was: "Police investigated and found that the driver was a 76-year-old lady who was dead." They were going to turn it over to Dr. Fisher, I think, to determine whether she died before or as a result of the accident.

I would like to drop the ball in your lap for a minute, Russ, because I heard you recently give a brief statement to us about this problem of people who die and cause an accident and those who die as a result of an accident.

DR. FISHER: I would confirm the fact that we have a real problem here. If the doctors can within their own ethics help to prevent these unnecessary accidents by helping the Department of Motor Vehicles to insure that only safe drivers are on the road, then it would seem wise to do so.

The statistics to which you referred, I think, were those that came from a survey of drivers found dead in automobiles involved in fixed-object collisions over a period of several years. Surprisingly enough, some 19 per cent of the drivers found dead after the crash in this series were found not to have had fatal injuries but to have had fatal disease. So that at least in this selected group of people who run off the road or run into fixed objects, disease accounts for the accident in nearly 20 per cent. I think this confirms the fact that we have a problem, and I think the suggestions made here tonight may stir up a little action in dealing with them.

EMERGENCY MEDICAL CALLS

Let us move on to another subject. A recent innovation in the Baltimore City Medical Society of a screening panel has caused considerable interest and comment. As you know, for a number of years the medical society has sponsored a program through Physicians' Exchange whereby any patient who did not have a family doctor and who needed a doctor in an emergency could call and he would be put in touch with a member of the panel of doctors who took these emergency calls.

This was not intended to take all calls just because a patient's doctor had gone to the movies and he couldn't be reached right away, but rather to supply doctors in emergencies when the patient did not have a family physician or could not reach his relief.

The society a year or so ago altered this program in order to lessen the burden a little bit on the panelists, the men on call, so that each member of the society acts in rotation for a twelve-hour period as a screener on these calls. That is to say, they are reported first to a doctor, not the one who might ultimately make the call but simply to one who screens the calls to decide if indeed it is an emergency situation, if indeed the patient needs a doctor to come to the home, or whether an ambulance should be dispatched.

He reaches a decision on the basis of talking with the person who calls in and advises the caller accordingly; either he will send an ambulance, or the patient doesn't need a doctor, or he should see his own doctor tomorrow, or what-have-you.

At any rate, he ends up producing advice via telephone, and this has interested us a lot. I would like to pose a question: What in your opinion is the liability of the physician who serves on this screening panel for the action he recommends?

MR. SOLTER: For those of you who are not members of the Baltimore Medical Society, in the Yellow Pages under "Physicians" there appears a little ad, if I may call it an ad. It reads as follows:

When you cannot locate your doctor, call Physicians' Exchange, PLaza 2-3340. If you cannot reach your doctor in an emergency, call Medical Service, PLaza 2-1400.

As I understand it, the last number is the one to which Dr. Fisher has just referred. First of all, as I understand it, an operator answers the call and does a little preliminary screening before she even calls the screening doctor. She then calls the doctor and fills him in briefly before he talks to the individual. So there is sort of a monitor service set up so that when the doctor does take the call, I believe the call is monitored by the operator, and perhaps—I don't know whether it is true or not, but maybe it should be done—some notes or records could be kept, over and above just the name and address and the date and the time, of just what transpired. I think this might be some sort of protection if somebody did cause trouble later.

In any event the questions to be answered are: Is a doctor needed now? Is an ambulance needed? Or is it something that you can tell them to hold until morning and go to the out-patient department or their own doctor, or find some doctor that will see them?

This is a pretty tough job, I would think, with the specializing in various fields. Frequently, when your turn is up, you might get some kind of case with symptoms that you are not familiar with, or disease you are not familiar with. You probably would refer a doctor to the case just out of good judgment or a fear that you might say the wrong thing, but in any event, this is a very difficult problem for a lawyer to answer, as to what the liability is under these circumstances.

Bear in mind we are not talking about the doctor to whom this call is eventually referred, if the screening doctor thinks a doctor should be called; we are just talking about the screening doctor.

Of course, generally, it is the duty of a physician to use the reasonable care and skill that are usually exercised by reputable physicians in the same community. That is the rule of thumb you have to follow. You have to exercise your own judgment as you see it at the time.

In researching this matter, I could find no case squarely on point. That does not say there is not one, but I was unable to find one. The closest case I could find was a New York case. Here suit was brought against a hospital and a physician for failure to treat the plaintiff's deceased husband. The plaintiff—the wife—took her husband to the hospital and informed the personnel at the desk that her husband was apparently having a heart attack. She also told the hospital personnel that they were members of some certain insurance plan. The hospital told her that they didn't handle patients under that plan. The nurse then called a doctor of the insurance plan on the phone, telling him the situation and describing the symptoms. The nurse then gave the telephone to the patient, who talked to the doctor and described his pains. The doctor told him to go home and come back when the insurance plan clinic was open. The patient died during the night.

The trial court dismissed the complaint against both the hospital and the doctor, but the Court of Appeals of New York took care of the situation and reversed, holding that a prima facie case had been established against both the hospital and the doctor and said that a doctor who undertakes to examine or treat a patient and then abandons him may be held liable for malpractice.

Actually I think that applies a little bit more to the second step in your procedure, but there it is for what it is worth. You would, I think, have to be extremely careful in using your judgment in these matters.

The fact that this is a gratuitous service doesn't relieve you from liability if you in fact are negligent under the definition which I have just given a few minutes ago. Having once undertaken to offer the service, the doctor must exercise that reasonable care and judgment that is accepted in the community in his advice.

I was asked whether I thought that the association as a group or as a unit would have any liability in a case of a doctor who negligently carried out this service. It was my opinion that the association probably would be exempted from liability because of its character and the fact that it is a non-profit organization which is rendering this service as a public service. But I am sure that could be debated quite extensively.

Of course, if the doctor is called as a result of the screening service, he must then go ahead and take the case and follow through to a reasonable conclusion until the patient is in the hands of someone who is competent.

I would like to say this at this juncture, before I close on this point, that I think there is a lot of fear of malpractice suits and liability on the part of doctors that is unjustified. It has been exaggerated because of the facts you see in the unusual case. I would like to read to you from one of the recent Maryland decisions what the plaintiff has to prove in a malpractice case in order to recover against you if you should be sued. This is a quote from *Suburban Hospital Association Incorporated v. Mewhinney.*

> It is settled in Maryland that the burden of proof in a malpractice case is upon the plaintiff to show a lack of the requisite skill or care on the part of the physician and that such want of skill or care was a direct cause of the injury; proof of either of these is wanting, the case is not a proper one for submission to the jury . . . General rules of negligence apply to malpractice cases as well as to ordinary claims of negligence. Therefore, to constitute actionable negligence, there must be not only causal connection between the negligence complained of and the injury suffered, but the connection must be by the natural and unbroken sequence without intervening efficient causes so that, but for the negligence of the defendant the injury would not have occurred. It must not only be a cause, it must be the proximate cause.

That is a stiff burden of proof for those of us who are in the area of negligence trial work, and I submit to you that it is a most difficult one to meet. Proof of that is that in the Maryland reports you will find that most malpractice cases that go to the higher courts end up—if they didn't end up below in favor of the defendant—in favor of the defendant, the physician, and the hospital.

LAWYER-DOCTOR LIAISON IN TRIAL WORK

DR. FISHER: We have one other question to be discussed here this evening. I am going to start by asking Mr. Israelson to discuss it and to round off the program by giving Mr. Solter a turn at it also.

There are frequent problems in communication between doctors and lawyers. Would you like to list several of these and suggest at least one method of dealing with each in the interest of better communication between the two professions?

MR. ISRAELSON: In approaching this, I selected what I think are probably four of the outstanding problems and approached it with the hope that in defining them, in discussing them, it may tend to draw our two professions closer together, help each to understand the other's problem, and possibly work a little more to eliminate them as problems.

The two professions meet most frquently in the personal injury field. You have two groups of physicians: the physician who has made up his mind he will accept these cases and will cooperate in their handling and the physician who will not. The first problem that arises is that of reporting on the case. Either a doctor is set up by inclination and secretarially to handle this or he is not.

If he is set up to handle them, then he should cooperate in reporting to the attorney on proper request. It is helpful, as you all by now have learned by the request of the attorneys, to report with several copies, because your report is not secreted in the lawyer's file—not under our present practice. Our present practice in the last twenty some years has been led by Chief Judge Emory Niles. Judge Niles' thorough administration of these discovery procedures has brought out of the darkness and eliminated surprise elements in the trial of cases by these procedures, which let both sides know what is in the other side's file. This means not only witnesses in the case but, from your viewpoint, the medical reporting of the case. So, when your report is received, if you are to testify in the trial of the case, a copy of your report must go to the other side in response to a proper interrogatory. Therefore, it helps immeasurably if you send your report in triplicate or duplicate, along with your bill, similarly in duplicate or triplicate.

If the doctors understand that everything stops in the negotiation and processing of a personal injury claim until their report is received and appreciate that this puts an absolute brake on the process of handling the claim, helping the patient

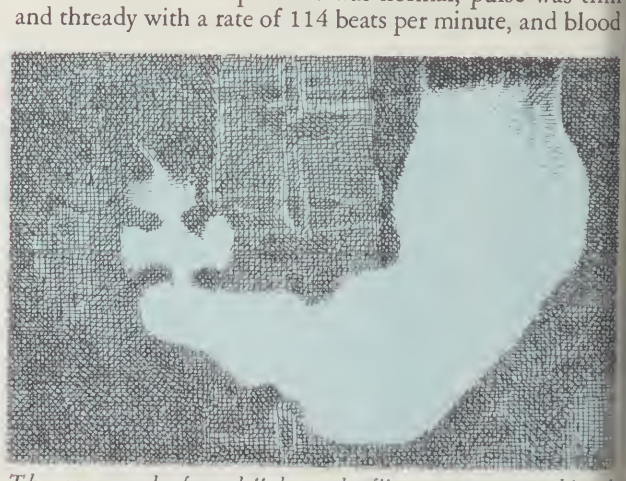
Duodenal mucosa with ulcer crater—
Approx. 80× Magnification.

Loosening epithelial cells of nasal mucosa during early stage of cold—Approx. 1800× Magnification.

this issue: partners in misery

Partners in misery: common cold and duodenal ulcer*

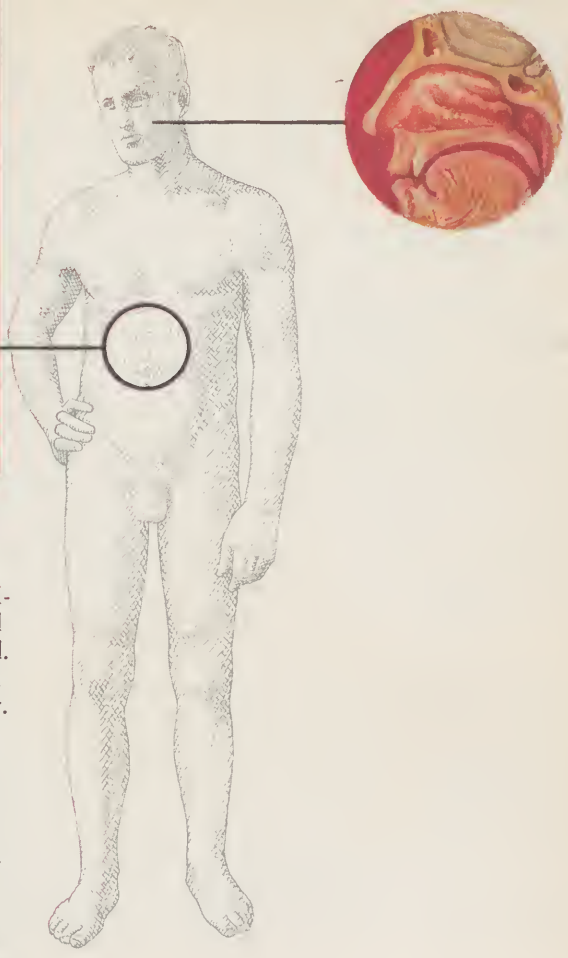
A century or two ago our forefathers believed that the common cold was caused by an excess of evil humors. Today we regard these baleful humors as a result of the cold rather than its cause. Only in the last ten years have some of the offending viruses been cultivated, and we now know many others can be transmitted to human volunteers although they cannot yet be grown in the laboratory. Various body defenses react to infection by a virus, and in the respiratory tract the lung is protected by the phagocytic properties of the pulmonary alveolar macrophage.[1]



Because of the brief history and large proportion of unidentified viruses, effective prophylactic vaccines have not yet appeared. A universal antiviral agent seems even more remote. Meanwhile, these viruses continue to produce epidemics of upper respiratory infection at seasonal intervals, particularly in spring, fall and winter, during which they propagate and distribute progeny indiscriminately. As a result, they are responsible for significant work loss. Since the immunity afforded is temporary, recurrent infections are common.

This recurrent morbidity in spring and fall is shared by duodenal ulcer, itself a cause of significant loss in wages and medical expense. Thirty years ago Emery and Monroe reported 1,279 recurrences of peptic ulcer of which 13 per cent could be attributed to upper respiratory infection, thus confirming a long-held clinical impression.[2] While the inflammation, congestion and secretion of the mucosa of the nasopharynx in the common cold, and the hyperemia and hypersecretion of the gastric mucosa during acute exacerbation of a duodenal ulcer may not be directly linked, it is probable that the miseries of the infection are reflected in the pain of the ulcer. The following case history illustrates this point.

Case report A 48 year old white male executive, suffering from hematemesis and melena for 12 hours was admitted to hospital on April 8, 1965. He gave a history of duodenal ulcer proved by x-ray studies 23 years previously. In the intervening years he suffered from typical epigastric pain occurring two hours postprandially, usually for two or three weeks each spring and fall. A hospital admission two years earlier had followed hematemesis of moderate amount.



The present admission was preceded by a recurrence of pain during a period of unusual business pressure. In addition he caught a cold one week before his entry to hospital and his already irregular eating habits were made more so by loss of taste and appetite, blocked nose and general malaise. During the final 36 hours he used aspirin to relieve his cold, taking 2 or 3 tablets with a glass of water on 6 or 7 occasions. Before retiring he drank a glass of hot toddy.

He awakened about 1 a.m. and vomited dark red blood and recently ingested food mixed with whisky. Melena followed and he was transferred to hospital. On admission he was pale, cold and sweating. Apart from epigastric tenderness and black stool on the examining finger after rectal examination, his general physical examination was not remarkable. Temperature was normal, pulse was thin and thready with a rate of 114 beats per minute, and blood

pressure measurement was 104/60mm. of mercury. Hemoglobin estimation was 8.6 grams per cent, but white blood count, chest x-ray and urinalysis were within normal limits. No further bleeding occurred. After blood transfusions and a suitable medical regime he was dismissed two weeks later and advised to return later for consideration of surgery.

The care of the ulcer patient suffering from a viral infection of the upper respiratory tract is additionally handicapped by the local and constitutional symptoms so produced. Indifference to food often makes it difficult to "feed a cold" even in a patient without an ulcer. In the ulcer patient this becomes more than a homily, for malaise and apathy towards irksome routine produce a lack of interest in adhering to an ulcer program and result in its eventual failure if these symptoms are not relieved. The absence of curative treatment for these viral infections has spawned many a strange therapeutic offspring and some of the more generally accepted remedies contain a special risk for the ulcer patient.

To the gastric physiologist, the shot heard around the world was not fired at Concord but was discharged through the stomach of Alexis St. Martin. The worthy voyageur had a more than modest thirst and on several occasions William Beaumont observed through the resulting fistula the changes of gastritis which followed an immoderate ingestion of alcohol.[3] It is now well known that alcohol stimulates the production of gastric juice and the patient with an ulcer, even in remission, should not drink alcohol without first taking food, milk or antacid. The use of various alcoholic remedies for the common cold is to be strongly discouraged in this type of patient. Factors already present can produce an acute exacerbation of ulcer symptoms without the added stimulus of alcohol.

Headache and facial pain, sore throat and generalized aching are subjective discomforts of viral infections of the upper respiratory tract or their complications. Relief from them is usually sought in the family medicine cabinet, and of all the medications habitually stored there, salicylates are the most frequently used. Oral ingestion of salicylates has produced

I can taste, Doctor!

On Sippy diet or unrestricted regimen, food tastes better to the patient with a cold when you prescribe the oral decongestant

Triaminic® *tablets*

Each timed-release tablet contains:

Phenylpropanolamine hydrochloride	50 mg.
Pheniramine maleate	25 mg.
Pyrilamine maleate	25 mg.

One tablet on arising, in midafternoon and at bedtime assures round-the-clock relief. You may occasionally encounter these side effects: drowsiness, blurred vision, cardiac palpitations, flushing, dizziness, nervousness or gastrointestinal upsets. Precautions: the possibility of drowsiness should be considered by patients engaged in mechanical operations requiring alertness. Use with caution in patients with hypertension, heart disease, diabetes, or thyrotoxicosis.

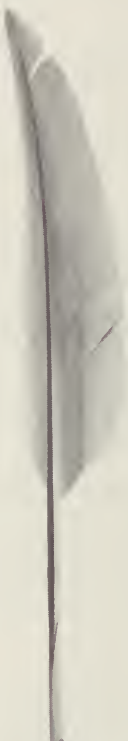
substernal pyrosis and sometimes epigastric pain in susceptible individuals. Bleeding from erosions of the gastric mucosa has followed their use and has been severe enough in some instances to cause hematemesis and melena.[4] It has been suggested that interference with the protective mucous layer of the stomach allows this to happen. There is no evidence that hypersecretion occurs, but the taking of aspirin has been followed by exacerbation of ulcer symptoms and occasionally by gastrointestinal bleeding.[5] The ulcer patient with a cold should take salicylates with an antacid, or preferably other means of symptomatic relief should be found.



Caffeine has two actions on gastric secretion. One directly stimulates production of acid and the other potentiates the out-pouring of gastric juice as a response to other stimuli.[6] In high doses to animals, it has produced erosive gastritis and peptic ulceration. Caffeine-containing beverages are discouraged for the ulcer subject and forbidden during an acute exacerbation.[7] Many cold remedies contain caffeine.

To sufferers from allergic rhinitis springtime brings symptoms of nasal obstruction, loss of taste and smell and malaise similar to those caused by viral infection but due instead to allergens which at that time of year are principally tree pollens. Relief from these symptoms can be obtained, though not wisely, by the use of steroid medication. Unfortunately, chronic sufferers from these allergies have used this approach with varying degrees of success. Steroid hormones increase gastric secretion and delay the healing of experimental ulcers.[8,9] Clinically their administration has been associated with reactivation of healed duodenal ulcers, and with bleeding and perforation which were not always preceded by typical ulcer distress. Because of these harmful effects, their use in the ulcer patient is best avoided for other than serious medical problems and then only with adequate antacid coverage.

Summing up It is immaterial by which pathways the malaise and lassitude, depression and irritability activate an ulcer, but it is the physician's responsibility to ensure that the medications he selects to relieve the symptoms of a cold do not further aggravate the ulcer.

conclude his claim, and payment of the doctor's bill, they would honor the request for reports as quickly as they can.

Reporting in these cases is just as much an obligation of the doctor who accepts the treatment and handling of it as the treatment itself. The doctor should never, of course, exaggerate or misstate his findings, his appraisal or his prognosis, any more than any other report should be exaggerated.

As to those who don't handle these cases, I lament their decision, and I have a feeling that Judge Niles would agree that those doctors who rid themselves of the problem by saying, "I just won't handle this kind of case," are really depriving both the patient and the judicial processes of some of the most competent and able advice in the medical field.

The next problem is what bothers you doctors so much: court attendance. The doctor's quite valid objection is the wasting of his time, but both the doctor and the lawyer can cooperate much more fully in this sphere toward eliminating this as fully as possible—you will never eliminate it completely—under the terrible situation in which the legal profession finds itself today.

For a combination of reasons, which committees of the Supreme Bench and the Bar Association are trying to fathom and correct locally, there is a serious backlog of cases, and I am sure all of you have heard or read of the backlog in most of the courthouses of the metropolitan areas in the country.

In one assignment, 209 cases were marked in the final assignment for one day, allegedly ready for trial with four civil judges operating the courts the following day. That is the unusual, and it is no use talking about the unusual or exceptional. Let's hope that this is a temporary situation and that it will revert to the former situation when cases could come up and be tried in normal course.

Here is the procedure followed in the courthouse in this city in connection with most of the personal injury cases. Three weeks before a case is tentatively scheduled for trial, the assignment commissioner sends out a postcard to the lawyers on both sides. Keeping in mind that at the optimum we have six civil trial judges in jury cases operating in our courthouse at any one time, you may wonder why the assignment commissioner sends out 100 cards—100 cases for a specific day three weeks hence.

I think you will find the answer rather obvious. In the course of three weeks many cases are settled; many are postponed for various reasons; and what we are trying to do is line up with enough cases, maybe just a few more, so that the six courts will be kept busy. When we speak of being kept busy, this means busy throughout a trial day, because you have to have a small backlog in case one of the assigned cases on that day is settled at the last minute or postponed at the last minute, and the judges, wanting to keep busy, want another case ready to go.

Of course, there is a multitude of reasons for postponements. Some of them are real; some of them are not so real. But many of them center around the absence of a witness, the absence of the client, the illness of a lawyer, the absence of a doctor, and many, many other reasons.

Nevertheless, the doctor's complaints are that he is notified to get ready; he puts time aside; he even cancels out office hours or eliminates some patients who are by set appointment. Then at the last minute he is called and told that the case is settled or postponed; in any event it is not going ahead.

He also complains: "I get a summons, I come to court, and that morning, after I have gotten to court, I am told the case is settled or postponed." The last complaint is when the case goes ahead, the doctor comes to court, but he is kept waiting.

These are valid complaints. To those in my profession, I lay at our feet a great part of the responsibility for this. It should be kept in mind, however, that the three-week notice is by no means more than a tentative notice, and it is utterly impossible for the court, for the judges, for the assignment commissioner, or for the lawyers to know with any reasonable degree of certainty until one day before the trial that a case is or is not going ahead.

When that takes place, after letting the doctor know tentatively a couple weeks in advance, the day before the trial is the first day of real activity. A call ought to go from the lawyer to the doctor or his secretary, telling him, "The case is in third or fourth position after the pending case. We may start tomorrow, doctor. I am sorry, that is the best we can tell you right now."

At least alert the doctor. It is not definite, but it is a maybe. We know that doctors have difficult schedules. If the lawyer checks with the lawyer in the pending court case to arrive at some estimate of the likely termination hour of that case, and then takes into consideration the one or two other cases ahead of him, he may be able to say to the doctor the day before, "I think we will get started tomorrow afternoon, in which case, doctor, we can't use you until day after tomorrow, because the opening hours will be taken with jury selection, opening statement, factual witnesses, and so forth."

On the eve of trial, and still better at ten o'clock the next morning, when the final assignment of cases is made, the lawyer is in better position to say to the doctor, "We think we will be able to call you between one and two o'clock tomorrow."

I think this gives the doctor some assurance that he need not sit by for any part of the whole first day and then look for another call the end of that first day for a fairly definite hour on the second day of trial.

One thing the doctors seem to resent is the issuance of a summons directing them to be in court at ten o'clock the next morning. You get a summons because the attorney must send you a summons. If he does not, and if he relies on merely telephoning and having you come in at the proper time, he lays himself open to severe censure from the judge if the case is on and the doctor is not there. The lawyer will very likely be asked, "Have you summoned the doctor?" If he dares admit he has not, the judge will direct him to proceed without the doctor, without the proof of injury, without the doctor's appraisal of permanency, without even the doctor's bill.

Some of the doctors ask, "Why can't my report be used instead of my coming to court?" Your report, excellent as it may be, detailed as it may be, does not contain all you will talk about in court. Still more important is the proposition that a report is not subject to cross-examination. You are. The opponent in the case has an absolute right to ask you questions, to try to qualify your opinions, to try to explain your findings and so forth, so that except in the very rare case that opposing counsel can stipulate, a report cannot be used.

When the doctor appears in court, the attorney asks, and usually the court will grant permission, to remove the witness on the stand, take the doctor out of turn, permit him to complete his testimony, and then excuse him promptly. If a judge does not do this, there is usually a good reason for it.

The third big problem has already been touched on by Mr. Solter, and that is the problem of malpractice. I agree with him, although we are frequently found on opposing sides of the trial table, that malpractice is exaggerated greatly, particularly here in Maryland. The newspapers and publications and reports out of California headlining the tremendous verdicts they get out there —none of which, incidentally, have ever been gotten in Maryland—is quite natural to rouse in the doctor some fear. The fear goes not only to his pocketbook but it goes to his ego. It goes to his professional reputation, so I don't blame the doctors for having the fear of it, but I would like to give you a few of the statistics I have been able to elicit. Unfortunately the State Insurance Department and the insurance companies do not segregate the statistics having to do with malpractice claims and payments as well as we might want; they are rather fragmentary.

This report was filed in December, 1962, with the State Insurance Department of Maryland. It is made by all companies reporting to the National Bureau of Casualty Underwriters. This includes approximately 150 out of 200 companies that report to the National Bureau. At the same time we ought to realize there are only four or five companies doing any appreciable business in Maryland.

Here are the statistics, which, unfortunately, while filed in December, 1962, are somewhat belated in that they refer to the five years preceding; 1955, '56, '57, '58 and '59. They are the latest reports we are able to find. In 1955 there were 24 claims; in 1956, 20 claims; in 1957, 25 claims; in 1958, 31 claims; in 1959, 35 claims. I am willing to assume there has been some increase in each of the next couple of years.

I spoke about this with an attorney of top standing in our community who has had some experience in this, and he felt—and I am inclined to agree with him—these sound like very low figures. However they are as complete and accurate as obtainable.

In that five-year period, based on the premiums taken in by all these companies reporting, com-

panies which did business in Maryland, the earned premiums for the entire period were $638,-668. The incurred losses were $321,061, meaning there is a loss ratio in the entire five-year period from 1955 to 1959 inclusive of 50.3 per cent.

That is not a strictly fair figure to the insurance company because in between earned premiums and losses incurred are the underwriting costs and the costs of doing business.

On the other hand, this statistic shows incurred losses, not paid losses, so that again there is an accounting difference there, it being, I believe, correct that the paid losses usually are below the reserves they put aside for what they call incurred losses.

This is the latest report available. It is my understanding that insurance rates are supposed to be geared to the loss ratio experience in the state of Maryland. I am confident that your society checks this carefully. In my best judgment, it would not be equitable if Maryland doctors are paying premiums based on *national* experience, because we know that many states around the country have much higher losses.

I am informed on good authority that at least one of our four major companies writing in Maryland is about to *decrease* its premium on malpractice insurance, which again would be an indication of the trend. If one does it, the four others are likely to follow suit.

So this bogey man that has been conjured up to scare the doctors and to alienate their affections for lawyers is not quite so big and dangerous a fellow as the exaggerated headlines might have us believe.

There is one other element of liaison where I think we could be on better ground. This has to do with the payment of doctors' bills. This is an inexcusable negligence on the part of attorneys, and I see a good many of my friends who are counselors in the audience. I say to you, if nothing else, I have two suggestions. I will get right to the meat of it.

In your power of attorney with your client, if you insert this, which I have incorporated into mine: "I further agree to be responsible for all depositions, medical, hospital, and other expenses as are necessary, and authorize my attorney to pay any that are unpaid out of my share of any recovery," that goes halfway, because this authorizes the attorney to pay them.

There is one more form I recommend to the lawyers, and I would recommend it to the doctors:

Dear Doctor, I retained Attorney So-and-so to handle my claim for injuries occurring (date). Kindly furnish him with such information and reports as may be requested of you concerning my physical condition or treatments given both before and since said injuries. I agree that I am personally responsible for all charges incurred for examination, treatment and/or reports, and should there be unpaid charges for these or other professional services due by me or my family owing at such time as any sums are recovered by my lawyer, he is authorized and directed to pay such unpaid charges in full out of my share of any recovery.

That would go three-fourths of the way. One more protection that the doctors can insist on if they care to, is to say; "I will be delighted to send you my reports, but, Mr. Attorney, please sign this last paragraph:"

I agree to comply with the authorization and direction of my client and pay the bills rendered by you in full out of any recovery to be obtained for said patient or his family.

Have the lawyer sign it, and you have a binding claim. I don't think any lawyer of repute would fail to pay a doctor's bill.

DR. FISHER: I am going to ask Dr. Classen and Dr. Ward to pick up any questions that may be written. While they are doing that, making a brief screening of these questions, I would like to ask Mr. Solter if he would like to comment on this general field of doctor-lawyer liaison.

MR. SOLTER: I certainly would like to comment on it, because I think that something has got to be done by both professions to erase the image as far as the lawyer is concerned of the demanding, selfish, inconsiderate person who is trying to use the doctor in order to make a big recovery and therefore a big fee, and the image of the doctor, on the other hand, of the prima donna who can't take time to follow his case to the logical conclusion that his association with the patient demands under certain circumstances.

I think that the two images are created by a small segment of both professions, but, as is always the case, the problem rubs off on everybody. The result is that you have unhealthy and unfriendly relationships existing.

I would hope that some day a president of the Bar Association of Baltimore City or the Maryland State Bar, or both, and the president of your society would form a joint committee to look into this problem, because I think it is extremely damaging to us both in the eyes of the public. Believe me, it is just as difficult from our side

as it is from yours, and I think the real answer to it is a simple one basically, and that is the use of common courtesy.

It is just as discourteous to a considerate lawyer to call up a doctor and ask him about a court appearance and get on the other end of the phone: "Who do you think you are? I'm not going to court. I don't testify and, furthermore, if you don't like it, you know what you can do about it." That happens, believe me. The only thing to do is issue a summons for him, and if he doesn't come in, ask for a bench warrant or appropriate summons. By the time he gets in, if you have to use him, he has lost his effectiveness because he is so mad that it rubs off on his testimony, and the whole thing turns into a great big fiasco.

I appreciate also the problem of the doctor who, without any prior notice, suddenly has a sheriff hand him a summons, particularly if he is one of the doctors who doesn't get into the situation often. The oldtimers who are used to it know how to handle the problem, but I have had clients of mine who are doctors call me up in a panic and say they have a summons for ten o'clock tomorrow morning. "I have got six operations set, an office full of patients, and so forth and so on; what am I going to do?" I won't tell you what my advice to them is, but it can easily be worked out.

I hope that this whole area can some day be explored and some helpful rules of mutual conduct developed that will make it easier for us, make it better for our patients and clients, and easier for the courts to cope with as well.

DR. FISHER: Here is a question directed to Mr. Israelson: What duty does the attorney have to pay an adverse medical witness that attorney may have to summons to court?

MR. ISRAELSON: When an insurance company requests an examination of the client, I permit it voluntarily without their having to get an order of court. If the report is reasonsably favorable, the attorney must ascertain if the opposing attorney is going to call the doctor to court. In one case I handled, although the opposing attorney said he was going to call the doctor to testify and indicated to the judge that he would, he failed to do so. So I summoned him. He then sent a bill for his testimony. I took the position that he had been called for examination by the opposing side; he had been paid by the opposing side, and should be paid for any court attendance made necessary by his examination.

DR. FISHER: Mr. Solter has two which I think are related to the problem of the Good Samaritan.

MR. SOLTER: These two questions overlap. What about a physician not licensed to practice in Maryland who in passing through Maryland encounters an injured individual? Is he protected according to Maryland law?

The other question is the other side of it: Is a Maryland doctor protected by the Maryland act if traveling in another state and renders aid and is later sued in Maryland?

This points up the problem I mentioned in the beginning. I would have to say, in answer to the first question, "Is a non-resident doctor protected in Maryland under the Maryland act?" the answer is no. The law specifically says a physician licensed to practice by the Board of Medical Examiners of the State of Maryland.

As to the second question, I would have to say no to that also, that the doctor from Maryland who is traveling elsewhere is not protected by the Maryland statute, but there might be more likelihood of that than otherwise if there is some comity between the states involved. This is not a reciprocal sort of statute in its present form, and I think these two questions clearly point up the need, if you are going to have the statute at all, to have it a uniform statute adopted in all states in the same language.

Of course, that is a rather rough problem, but it has been done in many areas of the law and maybe some day a Good Samaritan will be a Good Samaritan, whether he is in Baltimore or San Francisco.

DR. FISHER: One further question along that same line: What is civil negligence as applied to the Good Samaritan Act?

MR. SOLTER: That would be what I pointed out earlier in my notes here. It is a failure on the part of the doctor to exercise that degree of care, or a reasonable degree of care and skill that is customarily exercised by reputable physicians in the same area. Basically it is using that accepted standard of medical procedure which is customary in the community in which you are practicing. If you don't use that, then you have at least from a prima facie standpoint been guilty of an act or omission constituting ordinary negligence in the concept of a medical malpractice case.

DR. FISHER: As distinguished from criminal negligence in which there must be gross and wanton disregard for the life or property of another.

MR. SOLTER: I don't exactly agree that it would be necessarily criminal negligence used in the context of the Good Samaritan Act. We usually think of criminal gross negligence as having some sort of a penal aspect to it, but I don't think there is any penalty involved here except that of responding substantially in civil damages at the hands of a jury.

DR. FISHER: Here is a question which I believe will preempt my legal brethren from answering. Should out-patient mental patients who are under heavy sedation be allowed to drive?

This is a medical question, but I think any one of you here could answer it equally well, that any patient under heavy sedation has no business driving an automobile. Whether it be alcohol or drug sedation, he is a hazard on the highway, and he should be kept from driving in the interest of his own life as well as that of his fellow drivers.

Mr. Israelson has one with regard to some of the material he discussed. Is there any statutory authority for the action you set forth for the Department of Motor Vehicles as far as revocation of license is concerned?

MR. ISRAELSON: Yes, there is a statutory authority in the regulation given—the powers given to the Department of Motor Vehicles to regulate the safe driving on the highway. Under that they have set up this medical examining board that I have mentioned earlier. The reviewers and license examiners and those in authority then, upon recommendation of that board, have a complete right to revoke that license.

The question really went on: Does the person whose license is so revoked have appeal to the courts, and does prior good record enter into consideration? Yes, there is an appeal; any decision of the Department of Motor Vehicles revoking a license is appealable.

DR. FISHER: Here is a brief one: It it necessary to testify in court without proper arrangements for payment of services being made prior to trial? If so, how can payment be assured?

While you are cogitating about that, I am going to read one which is obviously a statement not a question, but you may enjoy it: "I wish to bring your attention to how inconsiderate some attorneys are in summonsing a doctor the day before trial, when the summons is the first notice the doctor has had of a case coming to trial, for instance, of a patient he examined many months ago."

I think we will get a comment from both members of the panel with respect to the question about pre-arrangement of service or fees before the trial and how a doctor is assured he is going to get paid later.

MR. ISRAELSON: There are two classifications, as I understand it, having to do with payment to physicians for testifying in court, one with regard to the so-called expert witness—that is, the witness called in to give an expert opinion—as opposed to merely his treatment of the patient and the factual medical details. Either can insist on payment. The nice way and proper way to accomplish this would be to call the attorney and say, "Now, you have asked me to come to court; my time is valuable; I would like some assurance of payment."

I am glad to say that most attorneys will cooperate on this. A doctor will set a reasonable fee; the lawyer will consult with the client and see if he is willing to assume this; that is, without contingency, because the doctor's fee is not on a contingency basis. The lawyer is nearly always on a contingent basis, so the lawyer runs a risk of not getting any fee.

Either the client-patient or the attorney can assure the doctor of payment if he chooses to do so. In any event, and especially in the cases in which there is a recovery, the payment for court attendance in my humble judgment is just as binding on the attorney to deduct from the recovery as is the bill for services for treatment.

MR. SOLTER: I have nothing to add to that. Is a medical student from out of state without a license to practice in Maryland covered by the Good Samaritan Act? The answer is no, because he is not licensed to practice by the Board of Medical Examiners of the State of Maryland, which is specifically set forth in this statute. This points out the complaint that many people have about the statute generally, that it should say "Any person who gives medical aid should be protected," because now it is giving the doctor greater protection than a layman or perhaps a person like this medical student who may be just

about ready to take his boards and really knows what he is doing.

The next question which has been handed me is: What is the law pertaining to attorneys referring clients to physicians? Are they practicing medicine when they do this?

I don't know exactly what is meant here, whether the question is when your client manages to pull himself into your office before having gone to a doctor, and then you send him to a doctor, or whether it means when you have a medical-legal problem in the course of preparation of a personal injury case and you refer him to a specialist for an examination and a report. Certainly the latter would in no sense be improper in any way I can think of.

The other, I must say I don't know the answer. I don't think the lawyer is practicing medicine, of course, but there may be some ethical point involved. I would think that if the lawyer, in his judgment, felt that the client needed help because he didn't know a doctor or had no way of getting medical advice and had some ostensible signs of injury, he would be entitled to suggest a doctor for him to see. I think the converse of the problem usually comes up more frequently, about doctors referring patients to lawyers, but I won't comment further on that.

MR. ISRAELSON: May I say just one word on that? There is no impropriety whatsoever for an attorney in the course of handling a case to get in touch with the treating doctor and ask certain information which may call for a specialist's opinion. It would be better from protocol to ask the treating physician to refer him to a specialist, but if the treating physician indicates he has no choice of a specialist and the attorney wants to suggest or recommend a reputable specialist, there is no impropriety whatsoever.

I cannot understand why lawyers shudder in court when the opposing counsel asks: "Were you sent to the doctor by the plaintiff's lawyer?" The plaintiff's lawyer should tell this in the opening statement to the jury: at some point in this case a question came up as to whether Mr. Jones had a certain condition. I called Dr. Smith and asked him to give me his opinion. As a matter of fact, frequently we call in a physician for private consultation, for the attorney's own information, to ascertain the real condition of the client.

DR. FISHER: There is a brief question here to outline the procedure or procedures to be taken in advance by an attorney to prevent the doctor from losing precious time at the trial by being forced to await his turn to testify.

MR. ISRAELSON: I mentioned that in the course of the main discussion, but when the attorney suspects he may have any difficulty with the judge, he should go to the judge in advance, before the case starts or at some juncture in the case when he is at the bench, and merely say, "Your Honor, I expect Dr. So-and-so in here at eleven o'clock. I know it will be taking him out of turn, but would you permit me to do this?" He may consult the other attorney; the other attorney may or may not object. Then it is entirely up to the court.

DR. FISHER: I'm going to ask Mr. Solter to answer a brief one, again about the Good Samaritan Act, comparing it in this state with other states, on the basis of the fact that our act specifies acts of the doctor without fee shall not be subject to litigation.

MR. SOLTER: Our act says, "For which the physician receives no fee or compensation." The question was asked: Our Good Samaritan Act contains the statement, "To a doctor who does not receive a fee." Is this statement or phrase in the acts of other states? If not, does this make the Maryland law different.?

Just shuffling through the other statutes here I see some of them do and some of them don't. Georgia said, "Without making any charge." There was another one that used the word "gratuitously." Then I ran across this one which answers one of the previous questions. This is the North Dakota statute. Specifically it extends the benefits of this statute to any physician or surgeon duly licensed to practice his profession in any other state.

They all vary. They all have different terms. I just wonder how much of a problem this really is to a doctor under those circumstances.

DR. FISHER: I would like to express the appreciation of the committee for the attendance of my two counselors, who have certainly done a very excellent job this evening. I would like to express the gratitude of the committee to those of you who came out on this threatening night which turned out to be one whale of a rainy night to join us.

TOPICAL TREATMENT

TYPICAL RESULTS

PRIMARY PYODERMA

AFTER TREATMENT WITH
'NEOSPORIN' ANTIBIOTIC OINTMENT
AND SALINE COMPRESSES

with 'NEOSPORIN'® brand

Polymyxin B-Neomycin-Bacitracin OINTMENT

Each gram contains:

'Aerosporin'® brand Polymyxin B Sulfate ..... 5,000 Units

Zinc Bacitracin ..... 400 Units

Neomycin Sulfate (equivalent to 3.5 mg. Neomycin Base) ..... 5 mg.

Tubes of ½ oz. and 1 oz.

- clinically effective
- comprehensive bactericidal action against most Gram-negative and Gram-positive organisms, including Pseudomonas
- rarely sensitizes

For the eradication of infectious organisms in a wide range of dermatologic disorders: impetigo, ecthyma, pyodermas, sycosis vulgaris, paronychia, traumatic lesions, eczema, herpes and seborrheic dermatitis. Prophylactically, for protection against bacterial contamination in burns, skin grafts, incisions and other clean lesions, abrasions and minor cuts and wounds.

Caution: As with other antibiotic preparations, prolonged use may result in overgrowth of nonsusceptible organisms and/or fungi. Appropriate measures should be taken if this occurs.

Contraindication: This product is contraindicated in those individuals who have shown hypersensitivity to any of its components.

Flagyl destroys trichomonads
here & here & here & here
No topical treatment can

Flagyl®

brand of

metronidazole

Flagyl eliminates the difficulties and frustrations that have long attended the treatment of trichomonal infection.

These difficulties arose mainly from:

1) the failure of any previously known agent to destroy the protozoan in paravaginal crypts and glands;

2) the failure of any previously known agent to prevent reinfection by eradicating the disease in male consorts.

The introduction of Flagyl removed both of these long-standing deficiencies. Hundreds of published investigations in thousands of patients have confirmed the ability of Flagyl to cure trichomoniasis.

Correctly used, with due attention to repeat courses of treatment for resistant, deep-seated invasion and to the presumption of reinfection from male consorts, Flagyl has repeatedly produced a cure rate of up to 100 per cent in large series of patients.

Nothing cures trichomoniasis like Flagyl.

Dosage and Administration

In *women:* one 250-mg. oral tablet t.i.d. for ten days. A vaginal insert of 500 mg. is available for local therapy when desired. When the inserts are used one vaginal insert should be placed high in the vaginal vault each day for ten days, and concurrently two oral tablets should be taken daily.

In *men:* in whom trichomonads have been demonstrated, one 250-mg. oral tablet b.i.d. for ten days.

Contraindications

Pregnancy; disease of the central nervous system; evidence or history of blood dyscrasia.

Precautions and Side Effects

Complete blood cell counts should be made before and after therapy, especially if a second course is necessary.

Infrequent and minor side effects include: nausea, unpleasant taste, furry tongue, headache, darkened urine, diarrhea, dizziness, dryness of mouth or vagina, skin rash, dysuria, depression, insomnia, edema. Elimination of trichomonads may aggravate moniliasis.

Dosage Forms

Oral–250-mg.tablets/Vaginal–500-mg.inserts

GLUCOLA™

Carbonated Preparation for
Carbohydrate Tolerance Tests

NEW

- **For use in glucose tolerance tests**
- **In preference to the postprandial test meal**

A NEW SOLUTION FOR AN OLD PROBLEM

Ready to use • Pleasant tasting cola flavor • Well tolerated

A 7-ounce bottle of GLUCOLA provides a liquid oral loading dose equivalent to 75 Gm. of glucose* for carbohydrate tolerance testing. GLUCOLA avoids the nausea that frequently results from lingering sweet laboratory preparations, and the occasional emesis that necessitates rescheduling the test. With GLUCOLA, no time is lost weighing and mixing glucose "cocktails"—only a bottle opener is needed.

753(R2)64

*The rapidly hydrolyzable saccharides in this formulation assure optimum absorption and glucose levels comparable to those obtained with a 100 Gm. loading dose.

Available through your regular supplier:
cartons of 12 7-oz bottles (6 bottles per pack, 2 packs per carton).

History of the Baltimore City Hospitals

BY DOUGLAS CARROLL, M.D.

Chapter 5.—The Almshouse At Calverton: The Beginning of Scientific Medicine (1840-1865)

It would be impossible to tell in detail how Louis' students brought back his spirit and his methods to their daily work, and of the revolution which they gradually effected in the study and in the treatment of disease.

Partly because the time was ripe and they were active agents in bringing the new art and science to the New World, partly owing to inherent capabilities, etc., but not a little because the brightest minds among them fell under the influence of Louis—they more than any others gave an impetus, which it still feels, to the scientific study of medicine in the United States.[1]

Advances In the Science of Medicine

If a time had to be set for the introduction of scientific medicine into the City of Baltimore, the year would be 1840; the place, the Baltimore City and County Almshouse; and the person, Dr. William Power. For it was in Dr. Power that the new age of scientific medicine was personified and brought to Baltimore.

Born in Baltimore in 1813, Power graduated from Yale in 1832 and from the University of Maryland School of Medicine in 1835. He was a student at the Almshouse in 1834. He then went to Paris to study five years with Pierre Louis. He was one of a number of Americans who brought back Louis' spirit and methods to the United States. As resident physician at Calverton in 1840, he introduced careful medical history, the new methods of percussion and auscultation in the physical examination, proper progress notes, and careful postmortem examination to try to understand the nature of disease. He

Staffordshire dark blue china teapot. "Baltimore Almshouse" From Moore, N. Hudson: "The Old China Book," Tudor Publishing Co., New York 1903 (Reprinted 1937, see p. 76). Picture of Almshouse is copy of Latrobe's "Alms House, Calverton."

continued his interest until 1852, when he died at the age of 39.

Characteristic of this period were the scientific papers resulting from work performed at the Almshouse. Dr. Thomas H. Buckler wrote his interesting book on the cholera epidemic.[2] William P. Howard carefully studied patients with malaria.[3] Articles on other infectious diseases were published.[4]

All through this period, medical students, residents, and visiting men participated in a teaching program as well as in patient care. Clinical lectures by the visiting physicians were frequent.

A number of students and residents at the Almshouse later became professors at the University of Maryland: Christopher Johnston in surgery in 1869; Frank Donaldson in physiology and hygiene in 1866; George Warner Miltenberger in obstetrics in 1858, and William T. Howard in diseases of women and children in 1867.

A large vegetable garden and dairy herd helped supply food for the inmates. There was a shoemaker shop, a tailor shop, a tin shop, a barber shop, a blacksmith shop, and a children's schoolroom. In 1865, 1,615 people were admitted; 57 children were born in the institution; 1063 were discharged; and 174 died. About 45% of the people admitted were of foreign birth. The largest number of admissions was in the age group 20-30 years. No residence requirements were necessary for admission. Nearly half the people admitted were thought to be "intemperate." The most common diagnoses made in 1865 were: debility, gonorrhea, primary syphilis, secondary syphilis, ulcers, acute and chronic rheumatism and phthisis pulmonalis.[5]

Attitudes Toward Inmates of the Almshouse

Segregation of the races was definitely being enforced at the Almshouse as early as 1818 and continued into the 20th century. Slaves were not admitted.

During the cholera epidemic in the Almshouse, two leading men of Baltimore, James McHenry, "a gentleman of fortune," and John C. Brune, not only volunteered their personal services as nurses but also give money to help the sufferers.

Perhaps much of the reforming zeal of this period was being used in the improvement in public education. In Baltimore, at least, there was no major loss of humanitarian energy in the abolition struggle.

In his book on cholera at the Almshouse, Dr. Buckler in 1851 noted that a single attack of illness often consigned an individual to the doom of pauperism. He stated that the first duty of every community is to take care of the poor and ignorant because they are unable to take care of themselves. This view echoes Chrysostom's wholly Christian point of view: "The poor have only on recommendation: Their need. If he be the most perverse of all men—should he lack necessary food, we ought to appease his hunger."[6]

In October, 1866, because of gradual deterioration of the building and the unhealthy situation, the Calverton Almshouse property was sold for $341,000, and the move to the present location was carried out.

Calverton had been unfortunately located in a mosquito-infested swamp. It was prone to epidemics of all the infectious and mosquito-borne diseases. In the midst of ignorance, epidemics, and filth, the beginnings of scientific medicine were laid by Dr. William Power.

SAXON

Well, Doctor Cunningham, I was just telling Herbert I should talk to you about my cough. It comes from down here and...

Chances are the symptom recital may prove to be as difficult to control as the cough. If it's the useless, exhausting type of cough that often accompanies respiratory infection or allergy, you can provide prompt relief with Novahistine DH. Its decongestant-antitussive action controls frequency and intensity of cough spasms without abolishing cough reflex. And the fresh, grape flavor of Novahistine DH appeals to children and adults alike.

When your diagnosis is bronchitis, complicated by thick tenacious exudates, Novahistine Expectorant is particularly useful. It not only provides decongestive action and controls the cough, but also encourages expectoration, thus easing bronchial obstruction.

Use with caution in patients with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Ambulatory patients should be advised that drowsiness may result. Continuous dosage over an extended period is contraindicated since codeine phosphate may cause addiction.

Each 5 ml. teaspoonful of Novahistine DH contains codeine phosphate, 10 mg. (Warning: may be habit forming); phenylephrine hydrochloride, 10 mg.; chlorpheniramine maleate, 2 mg.; chloroform (approx.), 13.5 mg.; l-menthol, 1 mg. (Alcohol 5%). Each 5 ml. of Novahistine Expectorant contains the above ingredients and, in addition, glyceryl guaiacolate, 100 mg.

ALLEGANY COUNTY

NEW 1966 OFFICERS

On December 15, the following officers were elected to serve for 1966: **David H. Miller, MD,** president; **L. Michael Glick, MD,** vice president; **Lester Kiefer, MD,** secretary; and **Wyand F. Doerner, MD,** treasurer. The Society has planned an active program for 1966, which includes outside speakers, joint meetings with the Pharmacists' and Bar Associations, and several social functions.

NEW PROFESSIONAL PERSONNEL COME TO ALLEGANY COUNTY

In June, 1965, **G. Allen Moulton, MD,** joined **Lester Kiefer, MD,** pathologist and director of laboratories at the Memorial Hospital, to serve as pathologist. Dr. Moulton is a graduate of The Johns Hopkins University School of Medicine. He was formerly associated with the Department of Neuropathology at the University of Maryland School of Medicine under the auspices of the National Institute of Neurological Diseases and Blindness, National Institutes of Health.

Allegany County Medical Society Officers, left to right: Lester Kiefer, MD, secretary; David H. Miller, MD, president; L. Michael Glick, MD, vice president; and Wyand F. Doerner, MD, treasurer.

In July, **Wayne C. Spiggle, MD,** joined **L. Michael Glick, MD,** in the private practice of internal medicine. Dr. Spiggle is a graduate of the Medical College of Richmond, Va., 1961. He completed his training in internal medicine at the West Virginia Medical Center, in Morgantown, with a subspecialty in clinical hematology.

In September, **Robert F. Miller, MD,** joined the Department of Radiology of the Memorial Hospital as associate radiologist. Dr. Miller received his training in radiology at the Germantown Hospital in Philadelphia. He became a Diplomate of the American Board of Radiology in 1964. Before his present position, he was radiologist at the Keesler Air Force Base Hospital, Biloxi, Miss.

In October, Kenneth N. Takehara, PhD, joined the laboratory staff of the Memorial Hospital as clinical biochemist and associate director of labo-

"Everything I eat turns to FAT!"

For the patient who must lose more than 15, 25 or even 50 pounds

For the patient who must lose more than 15, 25 or even 50 pounds...

the patient who must adhere to a long-term regimen — mere appetite suppressants are often not broad enough in scope. They suppress appetite and help achieve minor weight loss, but after several weeks the patient frequently becomes discouraged by a weight plateau. Many times other problems such as anxiety, constipation and hunger spasm complicate therapy.

Phantos Day-Long Action Capsules afford more complete obesity control because one capsule daily provides much more than mere appetite suppression. In addition to day-long appetite control, Phantos capsules supply a mild metabolic boost, alleviate hunger spasm, provide general mild laxation and promote sound sleep.

Unlike ordinary anorectics, the Phantos formula anticipates the problems which demoralize the dieting patient. The components are released at different times throughout the day, thus adhering to the changing pattern of the patient's need.

Each Phantos Day-Long Action Capsule supplies: for immediate release—amphetamine sulfate 5 mg., thyroid ½ gr., atropine sulfate 1/360 gr., aloin ¼ gr.; for intermediate release—amphetamine sulfate 5 mg., thyroid ½ gr., atropine sulfate 1/360 gr.; for final release—amphetamine sulfate 5 mg., thyroid ½ gr., phenobarbital* ¼ gr.
Also, Phantos-10: two-thirds above formula.

Dosage: One Phantos capsule daily, taken before breakfast.

Precautions: Contraindicated in cases of marked hypertension, coronary or cardiovascular disease, diabetes mellitus and thyroid disease. Use with caution in patients hypersensitive to barbiturates or sympathomimetic compounds (*Warning: May be habit-forming).

eczema: scourge of childhood

R. R., Age 11—Before treatment—atopic eczema of long standing

After treatment—with ARISTOCORT Topical Ointment 0.1% for two weeks

ARISTOCORT® Triamcinolone Acetonide Topicals have proved exceptionally effective in the control of various forms of childhood eczema: allergic, atopic, nummular, psoriatic, and mycotic.

In most cases responsive to topical ARISTOCORT, the 0.1% concentration is sufficiently potent. The 0.5% concentration provides enhanced topical activity for patients requiring additional potency for proper relief.

Administration and Dosage: Apply sparingly to the affected area 3 or 4 times daily. Some cases of psoriasis may be more effectively treated if the 0.1% Cream or Ointment is applied under an occlusive dressing.

Contraindications: Tuberculosis of the skin, herpes simplex, chicken pox and vaccinia.

Precautions and Side Effects: Do not use in the eyes or in the ear (if drum is perforated). A few individuals react unfavorably under certain conditions. If side effects are encountered, the drug should be discontinued and appropriate measures taken. Use on infected areas should be attended with caution and observation, bearing in mind the potential spreading of infection and the advisability of discontinuing therapy and/or initiating antibacterial measures. Generalized dermatological conditions may require systemic corticosteroid therapy. Steroid therapy, although responsible for remissions of dermatoses, especially of allergic origin cannot be expected to prevent recurrence. The use over extensive body areas, with or without occlusive nonpermeable dressings, may result in systemic absorption. Appropriate precautions should be taken. When occlusive nonpermeable dressings are used, miliaria, folliculitis and pyodermas will sometimes develop. Localized atrophy and striae have been reported with the use of steroids by the occlusive technique. When occlusive nonpermeable dressings are used, the physician should be aware of the hazards of suffocation and flammability. The safety of use on pregnant patients has not been firmly established. Thus, do not use in large amounts or for long periods of time on pregnant patients.

Packages: Tubes of 5 Gm. and 15 Gm.; ½ lb. jar.

sell, MD, instructor in medicine, The Johns Hopkins School of Medicine; and **Samuel Charache, MD,** fellow in medicine, The Johns Hopkins School of Medicine. The subject of the panel discussion was polycythemia and related disorders.

Dr. Conley said that the term *polycythemia* means an elevated hemoglobin content and hematocrit in the circulating blood but that a high hematocrit alone is not necessarily a part of the definition. Dehydration and diuretics may reduce the plasma volume and produce a falsely elevated hematocrit. The clinical manifestations of polycythemia are the result of the increase in blood volume and in its viscosity. The clinical manifestations are florid appearance of the face, changes in the vascular system with a tendency to disease of all blood vessels, primarily manifested by insufficiency and thrombus formation. The primary cause of polycythemia is arterial oxygen unsaturation which leads to the formation of erythropoietin in the juxtaglomerular apparatus of the kidney. Anoxia is the stimulus for this production. Causes are hypoventilation, the so-called Pickwickian syndrome, high altitude living, arteriovenous fistula, diseases of the lungs and heart which lead to an effective right to left shunt, abnormality of hemoglobin impairing the transfer of oxygen such as methemoglobinemia and an inherited hemoglobinopathy recently discovered and named Chesapeake Hgb, which has high affinity for oxygen. Administration of testosterone and the overproduction of corticosteroids such as in Cushing's disease may be associated with polycythemia. Finally, exposure to cobalt salts, which stimulate erythropoietin production, may cause polycythemia.

Dr. Jackson described polycythemia vera as a condition in which there is elevation of the hematocrit, the white blood corpuscles, and the platelets, accompanied by splenomegaly. Occasionally, the leukocyte count may not be elevated. Dr. Jackson reported on a patient who had conjunctival suffusion, nasal congestion, an hematocrit of 73, and was found to have a mass in the left upper quadrant of the abdomen. He was operated on and was found to have a hypernephroma. Dr. Jackson reviewed the incidence of polycythemia in association with hypernephroma. There is an incidence of polycythemia with nephroma. In such patients the plasma contains measurable erythropoietin, which the kidney produces. The

erythropoietin disappears with removal of the tumor and reappears when metastases from the hypernephroma occur. This has been seen also in renal carcinoma, adenomas, and sarcomas of the kidney, in renal cysts and renal tuberculosis, and in nephrosis, as well as in association with tumors of the brain, liver, adrenal, and uterus.

Dr. Russell described a group of patients who had elevated hematocrits without apparent cause. They were found not to have renal tumors, and there were no definitive causes (such as Dr. Conley outlined) of polycythemia associated with their illness. The inpatients were all men around 45 years of age who complained of dizziness and headache. Many had previous myocardial infarctions and history of gastric or duodenal ulcers. They all smoked fairly heavily, had histories of hypertension in the family, and exhibited other manifestations of vascular disease. On physical examination they all had hypertension and were generally of a stocky build and overweight. For the most part they exhibited only a rise in hematocrit but had normal leukocyte counts, normal platelets counts, normal differentials, and no splenomegaly. The patients had been treated by vena section in the past which brought little or no benefit. Six of these patients have been followed-up for 12 years. None has developed polycythemia vera, none has developed tumor, and none has developed splenomegaly. Dr. Russell suggested that a definite syndrome is associated with hypertension which is characterized by these patients, who are all tense, stocky, white men, heavy smokers with hypertension, and have a recurring of prior manifestations. Patients with this syndrome have been described earlier by Gaisback. This is one form of polycythemia which is not true polycythemia. There is no proof of increased erythropoietin in their blood, nor is there proof that vena section prevents further arterial disease.

Dr. Charache discussed the problem of blood viscosity and vascular complications in patients with polycythemia vera. When the hematocrit is high, viscosity rises. With the increase in the fluid viscosity, the heart's action to pump, in theory, must be greater. In actual fact, patients with polycythemia vera have no heart trouble; rather they have small hearts but they do suffer from intravascular thrombosis. Dr. Charache described the properties of fluids in terms of viscosity and shear and the theoretical relationship between these two. When shear decreases vis-

cosity increases and an increased hematocrit exaggerates the viscosity. Blood volume is increased, vascular distention occurs, flow is slower, viscosity is greater, and the hazard of thrombosis is greater. Dr. Charache showed the effect of a reduction of hematocrit upon shear and viscosity and gave a satisfactory explanation for the treatment of these patients by repeated phlebotomization.

After the scientific session the business session was held. The following new members were elected to active membership: **Maxwell D. Lai, MD, Samuel M. M. Lumpkin, MD, Edward E. Morse, MD, Carl J. Pauerstein, MD, Kirby L. C. Von Kessler, MD,** and **Kerr L. White, MD.**

The following members were elected to active membership by transfer from associate status: **Arthur E. Cocco, MD, Paul D. Meyer, MD, Emile R. Mohler, Jr., MD, Morton M. Mower, MD,** and **Mary Betty Stevens, MD.**

The following associate members were elected: **Leslie A. Bard, MD, William M. Coburn, Jr., MD;** and by transfer from active status: **John M. Atwood, MD,** and **Nathaniel M. Beck, MD.**

A motion made at the last meeting by **Samuel Morrison, MD,** that "if the membership of the Baltimore City Medical Society wish to instruct their delegates on an issue they may do so, and the delegates must be held to this instruction," was the subject of a lively and spirited debate. The motion was carried.

Dr. Arthur Siwinski reported, for information of the members of the Society, that **Russell Fisher, MD,** had requested a distribution of a flyer concerning information regarding criminal abortions and the legal implications thereof. This had been done in the preceding mailing, and Dr. Siwinski explained the flyer.

John Collins Harvey, MD

An eminent role in medical practice

- Clinicians throughout the world consider meprobamate a therapeutic standard in the management of anxiety and tension.
- The high safety-efficacy ratio of 'Miltown' has been demonstrated by more than a decade of clinical use.

Miltown®
(meprobamate)

Indications: 'Miltown' (meprobamate) is effective in relief of anxiety and tension states. Also as adjunctive therapy when anxiety may be a causative or otherwise disturbing factor. Although not a hypnotic, 'Miltown' fosters normal sleep through both its anti-anxiety and muscle-relaxant properties.

Contraindications: Previous allergic or idiosyncratic reactions to meprobamate or meprobamate-containing drugs.

Precautions: Careful supervision of dose and amounts prescribed is advised. Consider possibility of dependence, particularly in patients with history of drug or alcohol addiction; withdraw gradually after use for weeks or months at excessive dosage. Abrupt withdrawal may precipitate recurrence of pre-existing symptoms, or withdrawal reactions including, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, the dose should be reduced and operation of motor vehicles or machinery or other activity requiring alertness should be avoided if these symptoms are present. Effects of excessive alcohol may possibly be increased by meprobamate. Grand mal seizures may be precipitated in persons suffering from both grand and petit mal. Prescribe cautiously and in small quantities to patients with suicidal tendencies.

Side effects: Drowsiness may occur and, rarely, ataxia, usually controlled by decreasing the dose. Allergic or idiosyncratic reactions are rare, generally developing after one to four doses. Mild reactions are characterized by an urticarial or erythematous, maculopapular rash. Acute nonthrombocytopenic purpura with peripheral edema and fever, transient leukopenia, and a single case of fatal bullous dermatitis after administration of meprobamate and prednisolone have been reported. More severe and very rare cases of hypersensitivity may produce fever, chills, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, anaphylaxis, stomatitis and proctitis. Treatment should be symptomatic in such cases, and the drug should not be reinstituted. Isolated cases of agranulocytosis, thrombocytopenic purpura, and a single fatal instance of aplastic anemia have been reported, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity has been reported, usually after excessive meprobamate dosage. Suicidal attempts may produce lethargy, stupor, ataxia, coma, shock, vasomotor and respiratory collapse.

Usual adult dosage: One or two 400 mg. tablets three times daily. Doses above 2400 mg. daily are not recommended.

Supplied: In two strengths: 400 mg. scored tablets and 200 mg. coated tablets.

Before prescribing, consult package circular.

BALTIMORE COUNTY

The February meeting of the Baltimore County Medical Association was held at the Western Electric Company, Cockeysville, at the invitation of the medical director, **Samuel Bacon, MD,** and the executives of the Company.

After a delicious buffet luncheon, Dr. Bacon welcomed our members and introduced two executives, who explained the work of the company at this new plant. A tour was conducted for our members.

The following physicians were elected to active membership: **Leonard Berger, MD, Barbara A. Solomon, MD, John M. Krager, MD,**

Samuel Bacon, MD, medical director, Western Electrical Company, addressed the Baltimore County Medical Association at its February meeting.

A tour of the Western Electric Company's new plant in Cockeysville was part of the program. Left to right, Kevin Quinn, MD, William Pillsbury, MD, Theodore Patterson, MD, President Edward Krieg, MD, Vice President Gordon Grau, MD, and guide.

tazolidin® alka

utazone 100 mg.
luminum
de gel 100 mg.
ium trisilicate 150 mg.
pine
romide 1.25 mg.

In rheumatoid arthritis—effective therapy with minimal chance of G-I upset

eutic Effects
75% of patients obtain major relief of c symptoms, as reported by numer- nicians. In addition, the problem of t upset—a major problem with certain ral antiarthritic agents—is minimized resence of antacids and an antispas- in the formulation.

rement is generally seen within 3 to 4 nd trial therapy need not be con- beyond a week. Relief of pain is d quickly by resolution of inflamma- d improved joint function. Relief of oms is often accompanied by in- d appetite, gain in weight and an ed sense of well-being.

itial response is usually maintained t dosage increases; indeed, initial e is often reduced for maintenance es.

ate or steroid therapy can usually be shed or, in some instances, eliminated.

Indications
; danger of cardiac decompensation; or symptoms of peptic ulcer; renal, ; or cardiac damage; history of drug ; history of blood dyscrasia. Because ncreased possibility of toxic reac- he drug should not be given when the is senile or when other potent therapeutic agents are given concurrently. Large doses of Butazolidin alka are contraindicated in patients with glaucoma.

Precautions
Before prescribing, the physician should obtain a detailed history and perform a complete physical and laboratory examination, including a blood count. The patient should be kept under close supervision and should be warned to report immediately fever, sore throat, or mouth lesions (symptoms of blood dyscrasia); sudden weight gain (water retention); skin reactions; black or tarry stools. Regular blood counts should be made. The drug should be used with greater care in the elderly.

Warning
If coumarin-type anticoagulants are given simultaneously, the physician should watch for excessive increase in prothrombin time.

Pyrazole compounds may potentiate the pharmacologic action of sulfonylurea and sulfonamide-type agents and insulin. Patients receiving such concomitant therapy should be carefully observed for this effect.

Adverse Reactions
The most common adverse reactions are nausea, edema and drug rash. The drug may reactivate a latent peptic ulcer. Infrequently, agranulocytosis, generalized allergic reaction, stomatitis, salivary gland enlargement, vertigo and languor may occur. Leukemia and leukemoid reactions have been reported but cannot definitely be attributed to the drug. Thrombocytopenic purpura and aplastic anemia are also possible side effects. Confusional states, agitation, headache, blurred vision, optic neuritis and transient hearing loss have been reported, as have hepatitis, jaundice, and several cases of anuria and hematuria. With long-term use, reversible thyroid hyperplasia may occur infrequently.

Average Dosage in Rheumatoid Arthritis
Initial: 3 to 6 capsules daily in divided doses It is usually unnecessary to exceed 4 capsules daily. A trial period of 1 week is adequate to determine response; in the absence of favorable response, discontinue.

Maintenance: An effective level is often achieved with 1 to 2 capsules daily; do not exceed 4 daily.

Also available:
Butazolidin®, phenylbutazone
Tablets of 100 mg.

Mrs. Dorothy E. Holman

MONTGOMERY COUNTY

Seruch T. Kimble, MD, the 1966 president of the Montgomery County Medical Society, like quite a few doctors, has been able to manipulate time so as to get considerably more than 24 hours in each day. He seems to have the genius of doing a great many things well without slighting any of them.

Dr. Kimble was born in Washington, DC, on February 21, 1921. He attended George Washington University, receiving his AB in 1941 and his MD in 1945. He interned at Presbyterian Hospital in Chicago.

While a student at G.W., Dr. Kimble met Miss Helen Matchett, whom he subsequently married. Mrs. Kimble's father is General Henry J. Matchett, who helped plan the D-Day invasion of Normandy. The Kimbles with their two girls and five boys live in their roomy and delightful new home off Georgia Avenue, south of Olney.

Dr. Kimble is a member of the Association of American Physicians and Surgeons, the International Society of Internal Medicine, National Academy of Arts and Science, the American Geriatrics Society, Pan-American Medical Association, the New York Academy of Sciences, and the Eastern Psycho Analytical Association. He is a diplomate of the American Board of Internal Medicine. Locally he is affiliated with the Medical Arts Society of the District of Columbia, the Montgomery County Mental Health Association, treasurer of the Montgomery County Foundation for Community Health, a past member of the Board of the Montgomery County TB and Heart Association, and past president of the Civitan Club.

Dr. Kimble is on the staff at Suburban Hospital, Washington Sanitarium, and Holy Cross Hospital.

The symposium was arranged by the society's Committee on Medicare, which was appointed shortly after the passage of PL 89-97 last year.

Seruch T. Kimble, MD, the society's president, pointed out that the society recognizes that Medicare "will affect every physician, hospital, nursing home, and other health facilities as well as the majority of families in Montgomery County.

"The reality of the problems that will arise in our community has little to do with approval or disapproval of the law," he continued. "We hope that the fund of information and statistics that came out of the symposium will benefit all."

WASHINGTON COUNTY

A discussion of "Life Threatening Microbial Diseases and Their Treatment," a brief interesting trip through Pakistan, an upcoming sports injuries seminar, and a new executive secretary were reported at the March meeting of the Washington County Medical Society.

Theodore E. Woodward, MD, professor of medicine at the University of Maryland, reviewed some of the more occult causes of bacterial problems in an interesting discussion of "Life Threatening Microbial Diseases and Their Treatment." Dr. Woodward's presentation included colored slides and a review of his experiences while on sabbatical leave in Pakistan.

James W. Banks, MD, reported on the progress of a sports injury seminar, of which he is chairman, to be held April 2. Coaches and trainers from secondary schools and colleges within a 50-mile radius of Hagerstown have been invited. Attendance is anticipated at 150-200 people.

The resignation of **Mrs. Joyce Harlacher** as executive secretary was accepted with regret. **Mrs. Jacob G. Warden,** whose physician husband was greatly respected and admired, has been appointed as the new executive secretary of the Washington County Medical Society.

Robert vL. Campbell, MD, discussed medicine's viewpoint on Medicare with the Hagerstown Kiwanis Club. He explained that the decision

PENTID®-SULFAS FOR SYRUP

SQUIBB BUFFERED PENICILLIN POWDER WITH SULFADIAZINE, SULFAMETHAZINE, AND SULFAMERAZINE

the fruit punch that packs a wallop

Pentid-Sulfas for Syrup is a real knock-out when it comes to good taste. And, with a single prescription, you provide an anti-infective that combats both gram-positive and gram-negative bacteria. Notable for its economy, Pentid-Sulfas for Syrup is everybody's choice, patient, parent and physician.

Contraindications: Contraindicated in patients sensitive to sulfa or penicillin, pregnant females at term, premature infants, newborns during first week of life. **Precautions:** Watch for hypersensitivity reactions and overgrowth of nonsusceptible organisms. Observe usual precautions for sulfonamide therapy: adequate fluid intake; force fluids if urine volume is low; maintain urinary pH of 7 or higher; use only after critical appraisal in patients with liver or renal damage, urinary obstruction, blood dyscrasias. **Adverse Reactions:** Anaphylactoid shock (rare), G.I. disturbances, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, urticaria, purpura, hematuria, crystalluria, conjunctival and scleral varicula, petechiae may occur. **Dosage:** Daily pediatric dosage should supply 65-100 mg. trisulfapyrimidines per pound body weight in divided doses q. 4 to 6 h. **Supply:** Pentid-Sulfas for Syrup when prepared, provides 80 cc. (16 doses) or 150 cc. (30 doses) of fruit-flavored syrup providing in each 5 cc. teaspoonful 125 mg. (200,000 u.) potassium penicillin G and 167 mg. each of sulfadiazine, sulfamethazine, and sulfamerazine.

Now . . . **NEW PENTID® '400'—SULFAS FOR SYRUP** (buffered penicillin powder with sulfadiazine, sulfamethazine, and sulfamerazine each 5 cc. providing 250 mg. [400,000 units] potassium penicillin G and 167 mg. each of sulfadiazine, sulfamethazine, and sulfamerazine). Available in 16-dose (80 cc.) and 30-dose (150 cc.) bottles.

Richard A. Young, MD, society president, was re-elected to the executive board of the Mason-Dixon Council of the Boy Scouts of America. Re-elected as members at large were: **J. Walter Layman, MD**, and **Stanley Macht, MD.**

The records made by athlete **John Stouffer, MD,** during the 1965-66 winter season of the YMCA placed his name at the top of the "over age 30" category. He was timed for three miles in 17"30.0 and for the 880 in 2:22.2.

New members of the Washington County Medical Society are: **George W. Comstock, MD, T. W. Cooper, MD, John J. Donoghue, MD, J. E. Harrell, MD, R. E. Keyser, MD, A. Lazo, MD, J. P. Norris, MD, C. M. Snyder, MD, D. W. Whitcomb, MD,** and **C. R. Wierer, MD. John Turco** has returned from residency in Ob-Gyn. The society also welcomed the new county health officer, **Neil Gordon, MD.**

John W. Clark, MD, DDS

WICOMICO COUNTY

Mr. James Woodson, director of the Salisbury Social Security office, and **Mr. Richard Morris,** of the Charlottesville (Va) regional office of Social Security, were guests of the Wicomico County Medical Society at its March meeting. They discussed the mechanisms by which the Medicare program will be implemented and the coverage which will actually be provided.

At the same meeting, the society expressed opposition to HR 9256, a bill to provide mortgage insurance and loans for group practice facilities. The bill was at that time under consideration by the Subcommittee on Housing of the House Banking and Currency Committee.

Other business included approval of the application of **George H. Henning, MD,** for active membership in the society.

Mrs. Kit Hargreaves

Doctor,

Here is the Abbott anorectic program designed to meet the individual needs of your overweight patients.

mood elevation

Abbott
Anorectic
Program

DESOXYN® Gradumet® (methamphetamine hydrochloride)

Smooth appetite control plus mood elevation.

The obese patient on a diet often has to battle depression as well as overweight. Desoxyn Gradumet helps the dieter in both battles by elevating the mood while it curbs the appetite. Thanks to the Gradumet, medication is smoothly released all-day from a single oral dose.

If she can't take plain amphetamine, put her on DESBUTAL® Gradumet

Calms anxieties; controls compulsive eating.

Desbutal Gradumet provides 2 drugs in 2 tablet sections, combined back to back to form a single tablet. One section contains Desoxyn to curb the appetite and lift the mood; the other contains Nembutal® (pentobarbital) to calm the patient and counteract any excessive stimulation.

Both drugs are released in an effective dosage ratio throughout the day.

controlled release

Abbott
Anorectic
Program

Not all long-release vehicles are the same. Here is why the Gradumet is different and what it means for your overweight patients.

The release action is purely physical and relies on only one factor common to every patient: gastrointestinal fluid. There is no dependence on enteric coatings, enzymes, motility, or an "ideal" ion concentration in the gastrointestinal tract.

Your patients get a measured amount of medication, moment by moment, throughout the day.

They are not subjected to ups and downs of drug release . . . or to erratic release from patient to patient . . . or to erratic release in the same patient from day to day.

That's why the Gradumet provides controlled-release as well as long release.

Perhaps you saw the Gradumet model demonstration which shows that the release is entirely physical. When fluid is added, the drug in the outer ends of the channels dissolves. As fluid penetrates deeper into the channels, there is a continuous release of medication. The rate of release is rigidly controlled by the size and number of channels.

samples available

Each sample contains 6 tablets and a filled Sucaryl® Sweetener dispenser. For a supply, write Abbott Laboratories or ask your Abbott man.

economy

Patients, in many cases, save enough to get five weeks of medication for the price of four, compared to other leading long-release anorectics.

CONTRAINDICATION: Desoxyn and Desbutal are contraindicated in patients taking a monoamine oxidase inhibitor.

PRECAUTIONS: Use with caution in patients with hypertension, cardiovascular disease, hyperthyroidism, old age, or those sensitive to sympathomimetic drugs or ephedrine and its derivatives. Careful supervision is advisable with maladjusted individuals.

ABBOTT

Gradumet—long-release dose form, Abbott: U.S. Pat. No. 2,987,445.
Sucaryl—Abbott brand of low and non-caloric sweeteners.

601060

brings peace to the hyperactive colon

CANTIL®
(mepenzolate bromide)

helps restore normal motility and tone

"In 40 of 44 cases of irritable or spastic colon, Cantil [mepenzolate bromide] or Cantil with Phenobarbital reduced or abolished abdominal pain, diarrhea and distention and promoted restoration of normal bowel function . . . Cantil [mepenzolate bromide] proved to be singularly free of anticholinergic side-effects . . . Urinary retention, noted in two cases was eliminated in one by reducing dosage."[1]

IN BRIEF: One or two tablets three times a day and one or two at bedtime usually provide prompt relief. Cantil with Phenobarbital may be prescribed if sedation is required.

Dryness of the mouth or blurring of vision may occur but it is usually mild and transitory. Urinary retention is rare. Caution should be observed in prostatic hypertrophy—withhold in glaucoma. Cantil with Phenobarbital is contraindicated in patients sensitive to phenobarbital.

Supplied: CANTIL (mepenzolate bromide)—25 mg. per scored tablet. Bottles of 100 and 250. CANTIL with PHENOBARBITAL—containing in each scored tablet 16 mg. phenobarbital (warning: may be habit forming) and 25 mg. mepenzolate bromide. Bottles of 100 and 250.

MITCHELL ROSENHOLTZ, MD, *Chairman, Editorial Committee*

Curriculum Needed in Medical Technology

John E. Adams, MD

It can only be hoped that the recent series of three articles in *The Evening Sun,* under the title of "Test Tube Crisis," which described the origins and effects of the critical shortage of medical technologists, will arouse sufficient public interest to stimulate appropriate remedial action. There is no doubt that diagnostic laboratory work suffers in accuracy and promptness of service because of this shortage, which is becoming more acute almost daily and which, to some extent, forces pathologists to settle for less qualified and less highly motivated personnel. Night laboratory coverage, for example, is frequently provided by personnel with variable laboratory backgrounds, and the quality of night laboratory work may suffer. The demand for technologists far outstrips the supply, and there are not enough technologists to staff the existing laboratories during the day, much less at night.

Most hospitals in Baltimore would be delighted to offer technologist training programs, given the required college or university affiliation and a reasonable flow of students. Such programs are not maintained because there are no students to place in them. The lack of students is largely the fault of the undergraduate schools because of their failure to recognize and accept their responsibility to offer curricula for medical technology students. Pathologists have repeatedly and unsuccessfully solicited for affiliation with any of the many good undergraduate schools in this area. Educators here, unlike those in many other parts of the country, regard medical technology training as vocational training which should not be provided on an undergraduate level. They remain unconvinced that a career in medical technology is a professional career equal in potential for advancement, salary, and responsibility to that found in many other acknowledged professional careers such as nursing and teaching.

It seems unlikely that either University Hospital or The Johns Hopkins Hospital, will, within the foreseeable future, formulate medical technology training programs. These laboratories are completely decentralized and compartmentalized under multiple directors so that no one person or group is interested in championing the interests of medical technology for technologists. Indeed, there is no demand for doing so, since these laboratories remain well staffed with technologists trained by other hospitals who are drawn by the glamor of research activity or by a high salary scale with which other hospitals cannot compete. It would be difficult for a student in general medical technology to receive a comprehensive, well balanced training experience in these laboratories with a continuing lack of central direction of the laboratory as well as of a director of student education. For this reason, technologist training may often be better provided in the average-sized general hospital laboratory where direction is centralized and the opportunity for proper supervision and broad exposure to laboratory science is more accessible.

Even if the university hospitals are unsuited or unwilling to participate in medical technology training to bolster the manpower market they readily utilize, there would seem to be no sound reason for the undergraduate schools of the parent universities not to contribute by providing the curriculum and the appropriate degree in medical technology. Indeed, it would seem to be their obligation to do so.

DACTILASE®

Each tablet contains:
Dactil® (piperidolate hydrochloride), 50 mg.;
Standardized cellulolytic* enzyme, 2 mg.;
Standardized amylolytic enzyme, 15 mg.;
Standardized proteolytic enzyme, 10 mg.;
Pancreatin 3X** (source of lipolytic activity), 100 mg.; Taurocholic acid, 15 mg.

*Need in human nutrition not established.
**As acid resistant granules equivalent in activity to 300 mg. Pancreatin N.F.

In chronic or acute indigestion, fluttery, gassy stomachs obtain prompt, gratifying relief through the antispasmodic, surface anesthetic and enzymatic activity of Dactilase. Dactilase decreases hypermotility and pain and reduces the production of gas. Dactilase does not induce stasis, but helps restore normal tone. It has little or no effect on enzyme secretions, but *adds* enzymes, thus contributing to the digestive efficiency of the patient.

Side Effects and Contraindications: Dactilase is almost entirely free of side effects. However, it should be withheld in glaucoma and in jaundice due to complete biliary obstruction.

Administration and Dosage: One tablet with, or immediately following, each meal. Tablets should be swallowed whole.

Supplied: Bottles of 60 and 250.

REHABILITATION Notes

REHABILITATION SECTION
BALTIMORE CITY MEDICAL SOCIETY,

DOUGLAS G. CARROLL M.D.
EDITOR

VOCATIONAL EVALUATION OF THE HANDICAPPED

L. MYRTON GAINES, JR.
DANIEL MAUCHLINE
JULIAN NADOLSKY
ANNA MILLER
GORDON GEORGE

In 1964 the Baltimore League for Crippled Children and Adults instituted a program for vocational evaluation of handicapped individuals. This report summarizes the results in the first 47 clients and includes data from six months of follow-up.

To be eligible for this program a person must have a medical impairment—physical, mental, or emotional—and must be unemployed because of this impairment. An applicant has to supply his own transportation. He must also be able to take care of his personal needs and have the stamina to put in a six to seven-hour day. With these exceptions, the service has been available to any handicapped person age 16 or older and to any agency working with the handicapped.

The vocational evaluation entailed a comprehensive survey of the client's disability. His overall progress through the program was supervised by a psychologist. In turn, the client was seen and examined by a social worker, physician, and physical therapist; current cases are also being seen by an occupational therapist. Detailed reports of past treatment and evaluation were obtained. The client was then studied by the vocational evaluator. This study began with a battery of standardized psychological tests. Based on the strengths and weaknesses and personal preferences which came to light, the client was then given various work samples and situational tasks which included the use of office equipment, hand tools, and machinery. The emphasis was on the client's ability to perform the task, but an important byproduct was the general observations on work tolerance. The average person required two weeks to complete the evaluation. At the end of this period a staff conference was held to summarize each case. The emphasis then was placed not on the medical handicap but on the residual, functional ability and how this related to the world of work. The results of testing were compared with a pre-established occupational frame of reference.[1,2] This enabled a realistic vocational appraisal to be made on any or all existing occupations rather than a few selected training areas.

Results

By March, 1965, 53 clients had been referred for evaluation, mostly from the Division of Vocational Rehabilitation of the State of Maryland. After preliminary screening, five clients were rejected because their medical impairments were considered too severe. A sixth client was withdrawn by the referring agency because a trial of work tolerance was their aim and not vocational evaluation. The remaining 47 clients completed the evaluation. In all but two there has been a follow-up, at least six months after study at the League.

Age, Education, and IQ

The clients had an age range of 17 to 56 years with a median age of 28 years. There were seven female and 40 male clients. Thirteen were Negro and 34 were white. Fifteen were married, five

For cold hands and feet, nothing beats hot stoves—but they *are* awkward to carry around. Now Gerilid, in good-tasting take-along chewable tablets can provide rapid vasodilation of peripheral circulation, bringing real warmth to the extremities and decreasing sensitivity to sudden temperature change. Patients *like* Gerilid and *know* they are getting relief.

GERILID™

Each chewable tablet contains: nicotinic acid (niacin) 75 mg. and aminoacetic acid (glycine) 750 mg.

Administration and Dosage: One or two chewable tablets 3 times a day before meals. If flushing is objectionable, dosage may be lowered. However, tolerance to flushing usually develops without loss of efficacy in regard to vasodilation. The recommended dosage should not be exceeded.

Side effects: Occasional lightheadedness or transient itching which may disappear with continued use. There are no known contraindications; however, caution is advised when there is a concomitant administration of a coronary vasodilator.

Supplied: Packages of 50 chewable tablets.

Also available in liquid form as Geriliquid®, in bottles of 8 and 16 ounces.

had been divorced, and 27 were single. Their formal education ranged from 0 to 16 years with a median of 10 years. The most valid measure of IQ showed a range from 51 to 126 with a median IQ at 90.

Types of Recommendations

Table 1 lists the individuals according to their major medical impairment. The final vocational recommendation for each category is shown. The vocational recommendations were often specific in individual cases and were extremely diverse for the entire group. For purposes of analysis, however, the vocational recommendations can be grouped into five general categories. Direct job placement and vocational training are the highest recommendations. These two categories imply definite industrial potential.

Personal adjustment training would be the next best recommendation. An individual in this category would be considered to have possible industrial potential, but a period of sheltered work with personal and vocational counseling was considered to be necessary prior to entering the labor

Obstetrical or post—surgical patients requiring a dependable increase in hemoglobin will receive as much iron (250 mg. in a 5 cc. ampul) as in one pint of blood. Imferon (iron dextran injection) is less expensive and it avoids the well-recognized hazards of whole blood transfusion. When patients cannot—or cannot be relied upon to—take oral iron, Imferon (iron dextran injection) will rapidly supply needed iron for reserve stores.

IMFERON®
(iron dextran injection)

IN BRIEF: ACTION AND USES: A single dose of Imferon (iron dextran injection) will measurably begin to raise hemoglobin and a complete course of therapy will effectively rebuild iron reserves. The drug is indicated only for specifically-diagnosed cases of iron deficiency anemia and then only when oral administration of iron is ineffective or impractical. Such iron deficiency may include: patients in the last trimester of pregnancy; patients with gastrointestinal disease or those recovering from gastrointestinal surgery; patients with chronic bleeding with continual and extensive iron losses not rapidly replenishable with oral iron; patients intolerant of blood transfusion as *a source of iron;* infants with hypochromic anemia; patients who cannot be relied upon to take oral iron.

COMPOSITION: Imferon (iron dextran injection) is a well-tolerated solution of iron dextran complex providing an equivalent of 50 mg. in each cc. The solution contains 0.9% sodium chloride and has a pH of 5.2-6.0. The 10 cc. vial contains 0.5% phenol as a preservative.

ADMINISTRATION AND DOSAGE: Dosage, based upon body weight and Gm. Hb./100 cc. of blood, ranges from 0.5 cc. in infants to 5.0 cc. in adults, daily, every other day, or weekly. The total iron requirement for the individual patient is readily obtainable from the dosage chart in the package insert. Deep intramuscular injection in the upper outer quadrant of the buttock, using a Z-track technique, (with displacement of the skin laterally prior to injection), insures absorption and will help avoid staining of the skin. A 2-inch needle is recommended for the adult of average size.

SIDE EFFECTS: Local and systemic side effects are few. Staining of the skin may occur. Excessive dosage, beyond the calculated need, may cause hemosiderosis. Although allergic or anaphylactoid reactions are not common, occasional severe reactions have been observed, including three fatal reactions which may have been due to Imferon (iron dextran injection). Urticaria, arthralgia, lymphadenopathy, nausea, headache and fever have occasionally been reported. Initial test doses of 0.5 cc. are advisable.

PRECAUTIONS: If sensitivity to test doses is manifested, the drug should not be given. Imferon (iron dextran injection) must be administered by deep intramuscular injection only. Inject only in the upper outer quadrant of the buttock, not in the arm or other exposed area.

CONTRAINDICATIONS: Imferon (iron dextran injection) is contraindicated in patients sensitive to iron dextran complex. Since its use is intended for the treatment of iron deficiency anemia only it is contraindicated in other anemias.

CARCINOGENICITY POTENTIAL: Using relatively massive doses, Imferon (iron dextran injection) has been shown to produce sarcoma in rats, mice and rabbits and possibly in hamsters, but not in guinea pigs. The risk of carcinogenesis, if any in man, following recommended therapy with Imferon (iron dextran injection) appears to be extremely small.

SUPPLIED: 2 cc. ampuls, boxes of 10; 5 cc. ampuls, boxes of 4; 10 cc. multiple dose vials.

LAKESIDE | PRODUCTS FOR PATIENTS YOU SEE EVERY DAY

market. Personal adjustment training is not designed to impart a specific, salable skill to an individual but to equip him with good work habits which employers expect in all employees. These include such basic things as promptness, regularity of attendance, proper dress and grooming, ability to establish and maintain satisfactory interpersonal relationships, etc. No matter how talented or skillful a person may be, regardless of his intelligence or artfulness, these attributes are essential to maintaining employment.

A recommendation of sheltered workshop meant that the staff believed that such employment was the highest possible goal and industrial placement was unrealistic.

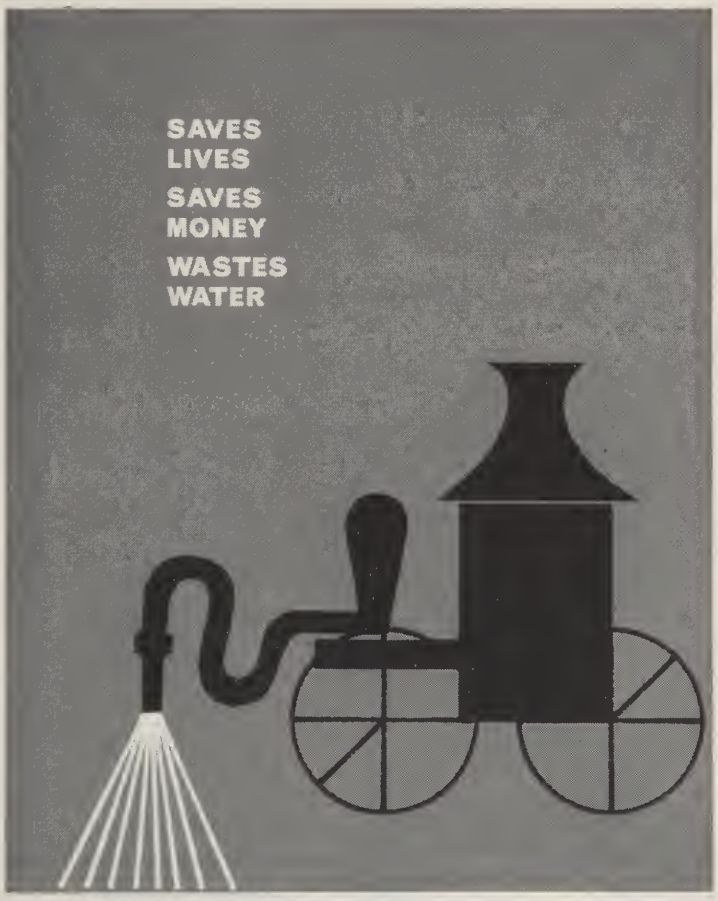
A final recommendation was that a client was suitable only for recreational activities.

Medical Impairments

There were 29 clients with neurologic impairments; eight, musculoskeletal; six, psychiatric; two, cardiac; and two, miscellaneous diseases. The medical impairments have been arranged in groups in the table for emphasis. Cerebral disease, idiopathic, probably represents an admixture of pathologic states. Encephalitis was suspected in three and a brain tumor in a fourth, whereas there was no clue to etiology in the fifth case. "Other" neurologic includes one case each of subdural hematoma, cerebellar ataxia, myasthenia gravis, and muscular dystrophy. "Other" musculoskeletal includes one instance each of osteogenesis imperfecta, scoliosis, herniated lumbar disc, amputation of leg, and multiple congenital deformities. The five clients with schizophrenia were all in partial remission after treatment. Both of the clients with cardiac impairments had coronary heart disease with a past history of myocardial infarction. The miscellaneous category comprises one person with cirrhosis of the liver and one who is deaf.

Impairments and Recommendations

As shown in the subtotals in Table 1, eight clients with neurologic impairments were considered capable of recreation only. No individuals with other medical impairments were considered to be so severely handicapped. Four clients, all with neurologic diseases, were deemed suitable only for a sheltered workshop. Four of the six clients for whom personal adjustment training was advised had neurologic diseases. With the exception of two individuals with schizophrenia, for whom personal adjustment training was suggested, all clients with non-neurologic impairments were considered to be proper candidates for vocational training or direct job placement in competitive employment. There is, thus, a distinct pattern of recommendations according to medical impairment with neurologic disease affording the most severe vocational handicap.



Not apparent from the table, but brought out clearly by individual case review, is the fact that the loss of higher functions of the cerebral cortex is most disabling. The basic intelligence, the ability to reason and make judgments, and the skills of communication were the most important requirements for vocational rehabilitation. Many of the clients with neurologic impairments had low intelligence quotients, exhibited an organic brain syndrome, or were aphasic.

With the exception of a few with borderline intelligence quotients none of the clients with non-neurologic diseases had such deficits in cerebral function. For example, of the eight clients for whom recreation was considered the highest goal, six had measured IQ's below 80 and the other two had organic brain syndromes. Four of the 8 had severe aphasia. There were only two (one poliomyelitis and one muscular dystrophy) in whom severe paralysis of extremities rather than cerebral deficiency was the major bar to employment. Even these two clients had dull normal intelligence, which prevented them from adapting to very sedentary work.

A sheltered workshop recommendation for four paralytic clients was related to severe aphasia in three and mental retardation in one. The clients recommended for personal adjustment training tended to have mild to moderate impairments. Only two of these six clients had low intelligence or communication problems. Vocational training was suggested for eight clients. One had an IQ of 78 and another had minimal aphasia and borderline intelligence. Neither of these two have succeeded in training programs. The remaining six individuals had no cerebral deficit and are achieving their goals in training.

Direct job placement was recommended for 21 clients. Only four of this group had an IQ below 80. Four of these clients had mild aphasia and one had organic brain syndrome.

Personal adjustment training was generally

METAHYDRIN (trichlormethiazide) is prescribed by physicians because it not only approximates the diuretic efficacy of parenteral meralluride injection . . . but, *it is the least expensive of all "brand-name" thiazides*. Therefore, when you prescribe METAHYDRIN (trichlormethiazide) your patients receive the thiazide diuretic that removes a little more salt and water than earlier thiazides, with relatively less loss of potassium . . . and, it's therapy they can more easily afford . . . *only pennies a day*.

METAHYDRIN®

(trichlormethiazide)

oral diuretic

Dosage: One 2 or 4 mg. tablet once or twice daily.

Precautions: As with all effective diuretics, vigorous therapy may produce electrolyte depletion. Patients with severely reduced renal function should be observed carefully since thiazides may be contraindicated. Care should be taken with patients predisposed to diabetes or gout. Patients with a tendency to potassium deficiency, as in hepatic cirrhosis or diarrheal syndromes, or those under therapy with digitalis, ACTH, or certain adrenal steroids, also should be watched carefully.

Side Effects: Nausea, flushing, constipation, skin rash, muscle cramps and gastric discomfort have occasionally been noted; rarely thrombocytopenia and bone marrow depression, photosensitivity, cholestatic jaundice, pancreatitis, perimacular edema, gout and diabetes have been caused by the administration of thiazides.

Contraindications: Complete renal shutdown; rising azotemia or development of hyperkalemia or acidosis in severe renal disease; demonstrated hypersensitivity.

How Supplied: Bottles of 100 and 1000 tablets.

found to be suitable for young, single men. There was no other correlation between age, sex, race, or social status and the results of evaluation. There was a trend discernible in the previous work history. Those clients who had been out of work for more than two years before referral tended to receive workshop or recreation designations, whereas those individuals who had been unemployed for less than two years tended to be placed into job or training categories. This trend may be artificial and reflect only the varying severity of the medical impairments. Young clients with no previous work or a poor work history tended to be recommended for vocational training or personal adjustment training.

Follow-up Data

A follow-up has been obtained on all except two clients at least six months after evaluation. The status at follow-up is summarized in Table 2. In this table the status at follow-up is contrasted to the initial recommendations and the major diagnostic headings. Of 21 clients recommended for job placement, nine have actually secured employment. Five of the eight individuals in the training category are receiving their suggested vocational training. Of the six recommended for personal adjustment, one was in training, one was in a sheltered shop, and the remainder were idle. Three of the four clients recommended for a sheltered shop were so employed, and two other clients who had been recommended for industry were in a workshop for the handicapped. None of the clients from the recreation category were found at work. The follow-up results confirmed that neurologic impairments afford a greater vocational handicap than other diseases.

Case Reports

The five clients who were paraplegic were very instructive and illustrate many of the aforementioned points.

S.W. was a 29-year-old, married, Negro man with a past work history of unskilled labor. He had suffered a traumatic spinal cord transection at the level of the twelfth thoracic vertebra two and a half years before. Despite marital and emotional problems he had fair motivation. He had learned to give complete self-care. He had an IQ of 105. Based on the aptitudes revealed in evaluation it was recommended that he be trained as a bookkeeper. This client is now in the Woodrow Wilson Rehabilitation Center receiving vocational training as a bookkeeper.

B.B., a 27-year-old, single, Negro man, had an almost identical severe paraplegia, having also had trauma with severance of the spinal cord at the twelfth thoracic vertebra three years before. In contrast to S.W., however, B.B. was mentally retarded with an IQ of 69. No doubt related to this, he had never learned to control his inconti-

BRING IT DOWN AND KEEP IT DOWN

Metatensin lowers blood pressure and keeps it low—effectively and economically. It combines reserpine with trichlormethiazide which affords more potent saluresis with less loss of potassium than from earlier thiazides. Reserpine contributes antihypertensive effect by relieving anxiety and tension. Metatensin is well-tolerated over long periods; with its effectiveness and economy it assures antihypertensive therapy you and your patients can stay with.

METATENSIN®

Each scored tablet contains:
METAHYDRIN® (trichlormethiazide)
2 mg. or 4 mg. and
Reserpine 0.1 mg.

Usual adult dose: One tablet twice daily. **Precautions and side effects:** Patients with hepatic cirrhosis or diarrheal syndromes, or under therapy with digitalis, ACTH, or potassium-losing steroids, should be observed for signs of hypokalemia. With thiazides, electrolyte depletion, diabetes, gout, granulopenia, nausea, pancreatitis, cholestatic jaundice, flushing, mild muscle cramps, constipation, photosensitivity, acute myopia, perimacular edema, paresthesias, neonatal bone marrow depression in infants of mothers who received thiazides during pregnancy, skin rash or purpura with or without thrombocytopenia, may occur. With reserpine, untoward effects may include depression, peptic ulcer and bronchial asthma. Withdraw medication at least 7 days prior to electroshock therapy, 2 weeks prior to elective surgery.

Contraindications: Complete renal shutdown, rising azotemia or development of hyperkalemia or acidosis in severe renal disease.

Supplied: Metatensin tablets, 2 mg., 4 mg.—bottles of 100 and 1000.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

LAKESIDE | PRODUCTS FOR PATIENTS YOU SEE EVERY DAY

nence. This client had fair motivation and an unskilled labor background. Evaluation revealed no vocational potential. He was recommended for a sheltered workshop. Plans for this have been delayed because of further surgery to help correct his urinary incontinence.

L.M. and W.B. present contrasts of individuals with much milder paraplegia. Both had neurologic damage at the fourth lumbar level with resultant partial paralysis and anesthesia of their lower legs and urinary incontinence. The cause was an unknown type of bone disease in the case of L.M. and a spina bifida with meningomyelocele in W.B. Both clients could walk with the aid of braces. L.M. was a 53-year-old, single, Negro woman who had been schizophrenic but was in remission while taking a phenothiazine medication. She had an IQ of 51, which was a valid measure of her observed functional status even though it might not have reflected her true intellectual capacity. She could not concentrate, had difficulty with any instructions, and performed all activities slowly. The evaluation discovered no vocational potential, and recreational activities only were recommended. In follow-up she was unemployed and inactive at home. W.B. was a 21-year-old, single, white man. Though immature and anxious, he had an IQ of 100 and seemed well motivated. He had aptitudes for clerical work, and training as a clerk-typist was suggested. In follow-up this client was succeeding in a secretarial course and was engaged in part-time work as a radio dispatcher.

C.G., an 18-year-old, single, Negro male had received a gunshot wound at age 15. This produced a spinal cord transection at the first lumbar level. He could ambulate slowly with bilateral leg braces and crutches but preferred a wheelchair. Antedating his injury he had chronic vesicle neck obstruction and had been partially incontinent of urine all his life. With this as an excuse he had remained at home and had no formal education. Psychologic evaluation revealed an inordinately dependent boy due to maternal overprotection. His IQ was 82. Evaluation revealed no vocational aptitudes at that time but much potential for the future if he could be matured. It was recommended that he receive personal adjustment training while working in our sheltered shop. Unfortunately, he dropped this activity promptly, and follow-up reveals that his status is unchanged.

Discussion

Throughout the vocational evaluation program the Baltimore League for Crippled Children and Adults has tried to emphasize important principles of rehabilitation. First, one must concentrate upon the residual ability of the handicapped and not the disability. This is a reversal of the classical medical interest. Where the physician has primary interest in diagnosis and treatment he must concentrate on the diseased part and not the healthy part. In our evaluation every attempt has been made to uncover and use the residual strengths and attributes of the individual. Second, one must be concerned with the functional status and not the anatomic damage or pathologic diagnosis. The medical handicap must be interpreted in functional terms that will allow the vocational evaluator to assign work that is realistic for the particular individual. The period of observation in a work situation during the evaluation was, in most cases, essential in this regard.

More than half of all the clients referred for vocational evaluation had neurologic impairments. This fact deserves some explanation because neurologic diseases are not the leading medical cause of unemployment. One obvious reason is that the Baltimore League for Crippled Children and Adults has long been interested in cerebral palsy. This old interest has created a public image which may have accounted for some of the influx of clients with neurologic diseases. Further, at the onset of this program the Division of Vocational Rehabilitation may have had a backlog of neurologic cases that were immediately referred. Other agencies, such as the Maryland Heart Association, were performing evaluations of individuals with other handicaps. All of these reasons may explain a portion of our referral bias. However, this high percentage of neurologic referrals continues. We believe that this indicates that neurologic impairments are the most difficult to evaluate vocationally and represent the greatest challenge in vocational rehabilitation.

At the start of the League's vocational evaluation program there were no preconceived ideas as to which types of impairment were compatible with employment, training, sheltered workshop, or recreational activities. Each case was considered upon its own merits; only in retrospect have distinct patterns of recommendation according to medical impairments appeared. As noted, clients with neurologic diseases had the greatest voca-

NORPRAMIN®

(desipramine hydrochloride)

non-sedating • rapid-acting
ANTIDEPRESSANT

overcomes guilt, lifts depression, restores confidence

Feelings of guilt, worthlessness, emptiness and loss frequently characterize depression. Such feelings, along with insomnia, physical complaints, sadness, apprehension, and other symptoms of depression rapidly respond to Norpramin (desipramine hydrochloride). Improvement often begins in 2-5 days, sometimes in less. A few patients, sensitive to central nervous system stimulants may become restless as depression is lifted—in such cases dosage may be reduced or a tranquilizer added.

Indications: In depression of any kind—neurotic and psychotic depressive reactions; manic-depressive or involutional psychotic reactions. **Dosage:** Optimal results are obtained at a dosage of two 25 mg. tablets t.i.d. (150 mg./day). **Contraindications and Precautions:** Glaucoma, urethral or ureteral spasm, recent myocardial infarction, severe coronary heart disease and epilepsy. Should not be given within two weeks of treatment with a monoamine oxidase inhibitor. Safety in human pregnancy has not been established. **Adverse Effects:** Side effects, usually mild may include: dry mouth, constipation, dizziness, palpitation, delayed urination, "bad taste," sensory illusion, tinnitus, agitation and stimulation, sweating, drowsiness, headache, orthostatic hypotension, flushing, nausea, cramps, weakness, blurred vision and mydriasis, rash, allergy, transient eosinophilia, granulopenia, altered liver function, ataxia and extrapyramidal signs. **Supplied:** Norpramin (desipramine hydrochloride) tablets of 25 mg., in bottles of 50, 500 and 1000.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

LAKESIDE | PRODUCTS FOR PATIENTS YOU SEE EVERY DAY

tional handicap. Furthermore, although the extent of paralysis is important, the most limiting factor is the amount of damage to the cerebral cortex, and a disturbance in ability to think, reason, and communicate was the greatest bar to vocational rehabilitation. This should not be too surprising, for rehabilitation has much in common with education.[3] Rehabilitation is really a process of retraining or re-education, and the ability to think and to communicate is essential to the success of either.

The vocational recommendation is the summation of opinion of the highest possible goal for that client, while the follow-up reveals the achievement or lack of it and measures something different. Follow-up information indicates the effect of many factors, including such complex psychologic phenomena as the motivation of an individual and needs for emotional dependency. These were not discussed in the results. Their great importance is recognized in the specific case, but there is no adequate, objective way to measure such factors. The results of the follow-up also reflect family pressures, marital status, family structure, family income, source and adequacy of disability pensions, social strata of family, etc. The follow-up data also mirror the needs and vocational opportunities in the community as well as the feelings of employers about particular handicaps.

The number of clients capable of work who remain unemployed is discouraging but not unusual.[4,5] It points up a need for aggressive vocational placement services to become an integrated extension of the evaluation process. The small sample reported here does not permit a meaningful breakdown of the types of jobs for which clients deemed ready for employment were recommended, but most were in unskilled or semiskilled categories. These are the jobs for which the greatest competition exists and which, consequently, require the most persistence and the best job-hunting knowledge to obtain.

It is a rare individual who can objectively separate his rejection as a potential employee from a rejection of himself as a person, who has enough ego strength to stand up to continued refusals. Development of this ability can be expedited through provision of factual labor market information and other information designed to help the individual objectify the process of job hunting and separate refusals of jobs from attacks upon himself as a person. This approach is not aimed at directly strengthening the client's ego but rather at helping him develop practical and non-stultifying defenses.

Concurrent with these psychotherapeutic activities, practical instruction is needed on how to complete applications, how to be interviewed, how to ferret out job openings, etc. In a really effective placement program, this intensive preparation and training of clients to carry on their own job searches is backed up by extensive job development by the agency's staff, for although it is most desirable to have the client find his own job, there will always be clients who need someone else to develop at least the first job for them. It is apparent that this is a complex subject which requires expenditure of considerable time by highly trained staff.

The lack of achievement of those clients recommended for personal adjustment training is particularly evident and indicates a need in the community for an appropriate vocational adjustment center for the immature handicapped. At the present time there is no agency in Baltimore prepared to mobilize the resources required to deal with this problem as it is presented by the population of which the clients in this study are representative. Experience in other large cities[6,7] indicates that such centers, using work as a medium of communication with the vocationally maladjusted, can successfully return significant numbers of such clients to competitive employment. Vocational adjustment centers attempt to deal with those aspects of the individual's personality which impinge most directly on his adequacy as an employee. By using trained counselors as foremen, detrimental behavior is dealt with in a constructive manner as it occurs in the work situation. Having the counselor on the scene when events occur lends an immediacy and an effectiveness to the counseling process which is lost when clients must be referred to a counselor off the work floor, and there is less danger of distortion in communication when third parties are not involved in client-counselor communications.

Finally, by reducing the case material to its bare essentials for analysis, there is a danger of oversimplification. Only the major impairment is listed, whereas in fact most clients had multiple diseases. The psychologic complexities often defy

In colicky infants Pediatric Piptal with Phenobarbital slows down spasm, diminishes pain and crying and improves feeding patterns. It permits sleep and rest for patient and family. The less than hypnotic amount of phenobarbital in the recommended dose affords a mild, calming action and enhances the antispasmodic action of Piptal (pipenzolate bromide). The latter drug, as reported in the medical literature, has a favorable ratio of effectiveness to side-effects which is unusual in anticholinergics and thus is particularly appropriate to pediatric use.

PEDIATRIC PIPTAL® WITH PHENOBARBITAL

each cc. contains 6 mg. phenobarbital (warning: may be habit forming); 4 mg. Piptal® (pipenzolate bromide), and 20% alcohol.

Pleasant-tasting Pediatric Piptal with Phenobarbital is miscible in milk, formulas and fruit juices, and may also be given by dropper directly on the infant's tongue. Dosage is 0.5 cc. 15 minutes before feeding; in severe cases, 1.0 cc. four times daily. High doses may occasionally cause constipation with tenesmus and, rarely, flushing without fever. It is contraindicated in bowel obstruction or sensitivity to phenobarbital or anticholinergics. Available in 30 cc. dropper bottles, droppers calibrated to deliver 0.5 cc.

any attempt to classify. It is therefore clear that each case represents a unique problem. The above patterns can serve only as general guidelines.

Summary

This report analyzes the results of vocational evaluation in the first 47 clients referred to the Baltimore League for Crippled Children and Adults. Most had neurologic impairments. It was found that in this sample neurologic diseases produced a much greater vocational handicap than did other types of disease. It appeared that this major difference was explained by the loss of cerebral function and not the motor paralysis in the neurologic diseases. If a person loses the ability to think or to communicate, he is left with little vocational potential.

Follow-up has shown the expected amount of human underachievement. It also revealed certain inadequacies of the community in placing individuals who could work or in the training of others with vocational potential.

THE HEART ASSOCIATION OF MARYLAND

The Electrocardiogram in Infants and Children

The basic electrophysiologic principles of electrocardiography are the same in infants and children as they are in adults, but slight changes in the technique make a more technically perfect record. In infants it is important to use the smaller infant limb electrodes as well as the small suction cup infant chest electrode. At times gentle restraint is necessary in order to maintain a stable base line.

P wave.—The average P-wave duration is 0.06 seconds and the wave is less than 2.5mm in height. It is normally inverted in AVR and usually reaches maximal height in lead II. If the duration is greater than 0.08 seconds or the height is more than 2.5mm, atrial hypertrophy is likely.

P-R interval.—In infants and children not only the rate but also the age must be taken into consideration. As a general statement, the P-R interval increases with age and decreases as the rate increases. Occasionally, the P-R interval may be less than 0.10 seconds in a child less than one year old. Up to five years of age the usual range is 0.12-0.14 with a maximum of 0.16 seconds. From 5-16 years the P-R interval usually is less than 0.18 seconds but may be as long as 0.20 seconds. Even though myocarditis may cause an increased P-R interval, such a finding is certainly not diagnostic. A constantly prolonged P-R interval may be a congenital conduction delay with or without coexisting congenital heart disease.

QRS.—In children the duration is usually 0.08 seconds or less, although occasionally it may be as long as 0.1 seconds. As a general statement, a q-wave usually has no significance in an infant's or young child's electrocardiogram. The R-wave is most prominent in the limb leads, AVF, and leads V_5 and V_6. The S-wave is most prominent in lead I, AVR, and precordial leads V_1 and V_2. A r^1 R^1 configuration may be seen in the right precordial leads, being more common in the younger child.

T-wave.—In lead I, the T-wave should be upright. Within the first 24 hours of life the T-wave may be upright in lead V_1 but should become inverted at least by the fourth or fifth day of life. After that time an upright T-wave in lead V_1 in the electrocardiogram of an infant or young child may be due to right ventricular hypertrophy. In the early hours of life the T-wave in V_6 may be inverted but should become upright after that time.

Axis.—In the early months of life the child has a definite right axis, usually being about +135. Sometime within the period between six months and a year, that degree of axis regresses and is usually replaced by a normal axis of approximately +75. These are average ranges only, and a right axis in a child even as old as 15 or 16 is not necessarily abnormal. It only means that the normal right axis found in the electrocardiogram of an infant usually regresses within the first year or so of life to a normal axis and then very slowly becomes relatively more negative over the next 10-15 years.

The diagnosis of ventricular hypertrophy on the basis of voltage alone, unless very marked, is not overly accurate. Of more help is the R/S ratio in the precordial leads.

Right ventricular hypertrophy should be sus-

pected if the following ratios of R/S in precordial lead V_1 are present or exceeded at the given age: 6 months, R/S 3.5-4.0; 18 months, 2.5-3.0; 3 years, 1.0-1.5; and 6 years and older, 1.0. Right ventricular hypertrophy should also be suspected when there is a deep S-wave in limb leads I, II, and III; a marked right axis deviation of +125 or more; a tall R-wave in AVR; a qR configuration in the right precordial leads; a deep S-wave in the left precordial leads or an R-wave in V_1 or more than 20mm, in height with an insignificant S-wave.

Left ventricular hypertrophy is usually manifest electrocardiographically by tall R-wave in V_{5-6} and deep S-waves in V_1; a R/S ratio in V_1 of less than 1.0 under 1 year of age and less than 0.2 between the ages of 18 months to 5 years; a left axis deviation of more than a −30 degrees under 16 years of age or T-wave inversion in the left precordial leads or a deep Q-wave over the left precordium. As a general rule, if the sum of the R-wave in V_6 and the S-wave in V_1 is greater than 50mm or if the R-wave in I and the S-wave in III is greater than 40mm, left ventricular hypertrophy is probable.

Combined ventricular hypertrophy is manifest by a combination of the findings of right and left ventricular hypertrophy. The most frequent finding is that of the indications of left ventricular hypertrophy plus a tall R-wave in precordial leads V_1 and V_2 or a deep S-wave in lead I.

An infant or child may have any cardiac arrhythmia. The more common ones are premature atrial, nodal, or ventricular beats, first degree A-V block, and paroxysmal atrial tachycardia (PAT). It is frequently the child of six months of age or less who develops PAT. A sinus arrhythmia is frequently found in children and is normal.

Alcoholism SECTION

From the Subcommittee on Alcoholism of the Medical and Chirurgical Faculty of the State of Maryland

GOVERNOR TAWES PROMOTES TREATMENT PROGRAM FOR HABITUAL DRUNKENNESS OFFENDERS

Maryland's Governor J. Millard Tawes has responded to the historic Driver case decision of the U.S. Fourth Circuit Court of Appeals by including in his supplemental budget for the coming fiscal year, planning money for a 200-bed rehabilitation facility for habitual drunkenness offenders.

The decision in the Driver case was that a chronic alcoholic suffers from a sickness and cannot be prosecuted for public drunkenness. The written opinion, by Judge Albert V. Bryan, states:

> The upshot of our decision is that the State cannot stamp an unpretending chronic alcoholic as a criminal if his drunken public display is involuntary as the result of disease. However, nothing we have said precludes appropriate detention of him for treatment and rehabilitation so long as he is not marked a criminal.

The Governor's new program is to be planned and administered by the State Department of Mental Hygiene and has been recommended by the Medical and Chirurgical Faculty of Maryland, the State Board of Health and Mental Hygiene (in its comprehensive mental health plan), Mayor McKeldin's Task Force on Alcoholism Programs for Baltimore, the Baltimore Area Council on Alcoholism, and jurists and legislators across the state. Delegate Harvey Epstein, of Baltimore's Fourth District, was an eloquent spokesman in favor of the appropriation.

A survey conducted by the Department of Mental Hygiene indicates that habitual drunkenness offenders (those individuals convicted of public drunkenness five times in one year) constitute a statewide health problem which traditionally has been the responsibility of correctional agencies. Nearly 300 have been identified in the City of Baltimore.

YOU CAN'T ARGUE WITH 90 YEARS EXPERIENCE IN FITTING INFANTS' AND CHILDREN'S SHOES!

Maternal Welfare

Instructive case histories submitted by Subcommittee on Maternal Welfare

JOHN WHITRIDGE, JR., MD, chairman

Case 12—Cause Undetermined

This patient was 18 years old, para 1. A previous pregnancy had been terminated by cesarean section because of cephalopelvic disproportion. During the present pregnancy she had received adequate prenatal care and was admitted, at term, in early active labor. Physical examination on admission was not remarkable and revealed no abnormalties of the lungs. Because of the previous cesarean section, a decision was reached to carry out immediate repeat cesarean section.

Under pentothal and cyclopropane anesthesia, a classical cesarean section was carried out uneventfully with the delivery of a 7lb 12oz living boy at 12:30 PM on June 18. Blood loss was not excessive, and the patient was given intravenous methergine after extraction of the placenta. No difficulties were encountered until the anesthetist noted excessive secretions as the abdominal wall was being closed. It became necessary to aspirate the patient's airway frequently.

The patient reacted from her anesthesia to the point where she was beginning to talk, but at this juncture the respiratory secretions became more profuse and râles were noted in both lungs. She was given a digitalis preparation intravenously (preparation and dose not noted). The heart rate rose to 140 per minute and the blood pressure ranged between 120/60 and 90/60. She was also given Solu-Cortef. An endotracheal tube was inserted, but despite suctioning through the tube she failed to respond and was pronounced dead at 3:35 PM.

Postmortem examination revealed early bilateral bronchopneumonia with marked pulmonary edema. The pericardial sac and heart were opened under water, and there was no evidence of air embolism. The pulmonary vessels were not remarkable, there being no evidence of pulmonary embolism. The pathologist lists the cause of death as early diffuse bronchopneumonia with marked pulmonary edema.

Comment

Frequently, as in this case, the committee finds it difficult to be satisfied as to the actual cause of death. In this instance the attending physician did not believe the death was due to bronchopneumonia, since on admission the temperature was normal and the lung fields were clear. He speculated whether this might have been a case of cardiac arrhythmia or some type of anaphylactic reaction.

Members of the committee wondered whether the patient had inadvertently received a pituitary preparation instead of methergine, since the clinical picture was compatible with that of adverse reactions when pituitary extracts are administered with cyclopropane.

The committee voted to classify this as a non-preventable maternal death with the exact terminal cause unclear.

SKIN PROBLEMS

Caused by itching due to:

Dry Eczema	Acne
Chafing	Ivy Poisoning
Minor Burns	Cold Sores
Athlete's Foot	Heat Rash

Bamadex® Sequels®

Contraindications: In hyperexcitability and in agitated prepsychotic states. Previous allergic or idiosyncratic reactions.

Precautions: Use with caution in patients hypersensitive to sympathomimetic compounds, who have coronary or cardiovascular disease, or are severely hypertensive.

Dextro-amphetamine sulfate: Use by unstable individuals may result in psychological dependence.

Meprobamate: Careful supervision of dose and amounts prescribed is advised; especially for patients with known propensity for taking excessive quantities of drugs. Excessive and prolonged use in susceptible persons, e.g. alcoholics, former addicts, and other severe psychoneurotics, has been reported to result in dependence. Where excessive dosage has continued for weeks or months, reduce dosage gradually. Sudden withdrawal may precipitate recurrence of pre-existing symptoms such as anxiety, anorexia, or insomnia; or withdrawal reactions such as vomiting, ataxia, tremors, muscle twitching and, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, reduce dose—operation of motor vehicles, machinery or other activity requiring alertness should be avoided. Effects of excessive alcohol consumption may be increased by meprobamate. Appropriate caution is recommended with patients prone to excessive drinking. In patients prone to both petit and grand mal epilepsy meprobamate may precipitate grand mal attacks. Prescribe cautiously and in small quantities to patients with suicidal tendencies.

Side Effects: Overstimulation of the central nervous system, jitteriness and insomnia or drowsiness.

Dextro-amphetamine sulfate: Insomnia, excitability, and increased motor activity are common and ordinarily mild side effects. Confusion, anxiety, aggressiveness, increased libido, and hallucinations have also been observed, especially in mentally ill patients. Rebound fatigue and depression may follow central stimulation. Other effects may include dry mouth, anorexia, nausea, vomiting, diarrhea, and increased cardiovascular reactivity.

Meprobamate: Drowsiness may occur and can be associated with ataxia, the symptom can usually be controlled by decreasing the dose, or by concomitant administration of central stimulants. Allergic or idiosyncratic reactions: maculopapular rash, acute nonthrombocytopenic purpura with petechiae, ecchymoses, peripheral edema and fever, transient leukopenia. A case of fatal bullous dermatitis, following administration of meprobamate and prednisolone, has been reported. Hypersensitivity has produced fever, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, stomatitis, proctitis (1 case), anaphylaxis, agranulocytosis and thrombocytopenic purpura, and a fatal instance of aplastic anemia, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity, usually after excessive dosage. Impairment of visual accommodation. Massive overdosage may produce drowsiness, lethargy, stupor, ataxia, coma, shock, vasomotor, and respiratory collapse.

First aid for a button popper

Second aid for a button popper

Bamadex® Sequels®

d-amphetamine sulfate (15 mg.) and meprobamate (300 mg.)
Sustained Release Capsules

By providing combined anorexigenic-tranquilizing action, BAMADEX SEQUELS Capsules help your nonshrinking patients to establish new patterns of eating less. The amphetamine component suppresses the appetite, while the meprobamate helps allay nervousness and tension. And for most patients, the *sustained* release of the active ingredients makes possible convenient one-capsule-a-day dosage.

Syndromes of Minimal Brain Dysfunction in Children

RAYMOND L. CLEMMENS, MD
Associate Professor of Pediatrics and Director of the Central Evaluation Clinic for Children, University Hospital

The term *minimal brain dysfunction* does not refer to a necessarily minor or unimportant impairment but rather to brain involvement which is not readily and grossly demonstrable.[1]

The diagnostic and descriptive categories included in the term refer to children of near average or higher general intelligence with learning or certain behavioral abnormalities, or both, ranging from mild to severe, which are associated with subtle dysfunction of the central nervous system. These may be characterized by combinations of deficits in perception, conceptualization, language, memory, and control of attention, impulse, or motor function.

These aberrations may arise from genetic variation, biochemical irregularities, perinatal brain insults, illnesses or injuries sustained during the years critical for the development of the central nervous system, or from unknown cause. During the school years a variety of special learning disabilities are the most predominant manifestations.[2]

Neurologic disorders in the form of manifest brain damage resulting in mental retardation, cerebral palsy, or seizures can usually be recognized without difficulty. However, the realization that certain behavior, language, and learning problems can be caused by minimal central nervous system disorders has come about only gradually.[3]

Neurologic Factors

Two major categories of neural-anatomic and neuro-physiologic disorders need be considered. First is the group with neurologic damage or cellular destruction as a result of some insult to the brain, called minimal brain damage. Other terms used to designate the same condition are chronic brain syndrome, hyperkinetic impulse disorder, organic brain disorders, and Strauss syndrome. The second group is that with physiologic and maturational deviations which result in marked unevenness of functioning and which many investigators believe represents constitutional idiosyncrasies of genetic origin, called specific language disability.

Children with minimal brain damage present a picture of generalized awkwardness, principally manifest in fine motor incoordination, difficulties in balance, mild chorea-athetosis, and poor handwriting. Hyperactivity, distractability, impulsivity, perseveration, low frustration tolerance, and learning disorders are among the other cardinal manifestations.

Specific Language Disability

Specific language disabilities, the second major category of minimal brain dysfunction, are not the result of neurologic insult but are considered to be the extreme of individual variability (constitutional idiosyncrasy).[4] These conditions occur much more frequently in boys than in girls and are presumed to be of genetic origin. Although overall intelligence is average or higher, there is particular difficulty in learning language

From the Department of Pediatrics, School of Medicine, University of Maryland School of Medicine.

skills, including reading, spelling, and often handwriting. The condition is often associated with delayed speech development, articulation defects, mixed laterality, delayed determination of handedness, fine motor awkwardness, and directionality confusion.

Importance of Diagnosis

The various manifestations of minimal brain dysfunction are such that it is difficult for a child to adjust in an ordinary classroom setting or to achieve at a rate commensurate with his general intellectual abilities. The restlessness, impulsivity, and unpredictable nature of their responses make the usual class setting inappropriate. Teachers become annoyed because the child cannot sit still, conform to usual group instructions, or achieve at expected rates. In many instances secondary emotional disturbances develop which may eventually present as the major problem.

Drug therapy can be of significant value in decreasing the hyperactivity and distractability associated with minimal brain dysfunction.

Once the child's organic difficulties have been recognized, a reasonable understanding of the psychological factors which are commonly present may be achieved. A simple explanation of the clinical diagnosis, the symptoms, and their significance help teachers and parents in their attitude and approaches; this in turn may help these children to cope with environmental stress at home, at play, and in school.

A significant number of seemingly organically impaired children can be managed by a combination of direct parent counseling, structured environment, psychotropic drugs, and special educational planning. Some of these children present a generalized picture of immaturity, to which the mother often responds instinctively with overprotection. Within limits, this may be helpful to the child rather than detrimental, as might be suggested on superficial examination. This point should be considered in our appraisal of overanxious mothers. In more difficult cases and when a weakness in the capacity of the parents to respond to the child's needs are the most important limiting factors, more formal psychotherapeutic intervention may be required.

In the management of children with severe reading disabilities, special educational placement in a small group setting, using multisensory (visual, auditory, kinesthetic, tactile) techniques, will often bring about satisfactory progress in children who have failed to learn by the usual pedagogic methods in a regular classroom setting.

The Science of Communication as practiced at Monumental Printing

It's more than a science: it's an Art, the precise transliteration in print of an intangible idea for a heterogeneous group of critical readers.

Here, at Monumental Printing, we learned to handle the tools of intelligent communication by the empirical method: working with them. The brush and palette of our art, the chisel, the score, the script are simply words on paper. We learned their proper use over 50 years of practice by being permitted to print such Journals as:

Clinical Chemistry
Digestive Diseases
Fertility & Sterility
Occupational Medicine
Leprosy
Mental Hospitals
Psychiatric Studies and Projects
Psychosomatic Medicine

We speak your language. We know the difference between edema and enema; syndrome and symptom; sewage and seweroge. And when and why we should use 12 point Caslon Bold instead of 10 point Stymie.

If you, too, need a good printer, let's communicate!

Monumental Printing Co.

Dermatoglyphics in Medicine

MIHÁLY BARTALOS, MD
Medical Geneticist
Department of Pediatrics
Howard University College of Medicine

The use of fingerprints in personal identification is widely appreciated. Less well known is the fact that fingerprint patterns can have characteristic configurations in certain clinical entities and thus be of diagnostic value.

The word "dermatoglyphics" is used in medical literature to describe the skin patternings of fingers, toes, palms, and soles. The dermatoglyphic patterns are composed of epidermal ridges. They are so variable that their characteristics are not duplicated either in another region or in another individual. A person's dermatoglyphic patterns remain unchanged during life. Studies on various biologic aspects of dermatoglyphics by Kristine Bonnevie established the basis for genetic studies on dermal ridge patternings.[2]

The first instance of characteristic dermatoglyphic pattern was discovered in mongolism by Cummins and Workman. In mongolism, palmar abnormalities are not limited to dermal ridge formation but involve the flexion creases as well. The fusion of two palmar creases into the "mongolian" or "four-finger" line (sometimes called simian line) is well known to physicians, as is the absence of one flexion crease on the fifth finger. Flexion creases can readily be analyzed by simple inspection, and they should be distinguished from the dermal ridge patterns, which can be best studied from prints obtained from the subjects. This is especially true for newborns where the ridges are less distinct.

On the fingers and toes one can find the combination of three basic patterns which are referred to as arch, loop, and whorl. The loops open toward the radial or fibular and tibial or fibular sides and are designated accordingly. By studying the dermal ridge patterns, one can notice points where three radiants meet and form three angles of approximately 120 degrees each. Such points are referred to as triradii. The most important landmark on the palm is the axial triradius, which is usually located in a proximal position near the wrist crease. In mongolism this triradius is displaced distally and ulnar loops occur frequently on the fingers. Occurrence of patterns in the third interdigital area of the palm was seen more frequently also in mongoloid patients. It is generally believed that the formation of the dermal ridges are determined by several genes spread over many chromosomes.[4] One would therefore expect that the presence of an extra chromosome, with its large number of genes, might well produce characteristic peculiarities in dermal pattern formation. Since it is well established that in mongolism all or a large portion of one of the smallest chromosomes is present in triple dose,[1] the finding of dermatoglyphic peculiarities in this condition is not surprising.

The practical importance of dermatoglyphic studies in mongoloid patients is in their contribution to diagnosis. The clinical stigmata found in mongolism are numerous, yet they may be inconclusive.[3] At present, chromosome analysis is regarded as producing the most reliable diagnostic criterion. Between the reliability of chromosome studies and the commonly noted clinical features, dermatoglyphic studies occupy an intermediary position. Since the study and evaluation of dermatoglyphics is far more simple than are cytogenetic studies, dermal ridge analysis can be used profitably by the practicing physician.

The author is supported by Special Project Grant Number 414 of the Children's Bureau, Department of Health, Education, and Welfare.

THE Regent

Nursing & Rehabilitative Treatment Center

operated under the direct supervision of the Lowry Memorial Medical Center.

Offering full treatment to the adult physically handicapped, specialized care to the senior citizen, and convalescent care to post-stroke and post-operative cases. Separate area for cancer patients. *All facilities available to private physician.*

Professionally staffed and equipped Physical Therapy gymnasium, under the direct supervision of a specialist in physical medicine. There is also an organized program of recreation.

Everything at The Regent is designed to be used by wheel chair patients.

Adjacent to the Penn-Mar Shopping Center on Marlboro Pike Beltway Exit 34

8100 Marlboro Pike, Forestville, Maryland

While mongolism is the best known and most frequently observed condition with characteristic patterns of dermal ridge configuration, it is not the only one. A congenital malformation syndrome, referred to as D_1-trisomy syndrome, or Patau's syndrome, is similarly due to chromosomal aberration. The chromosome involved in D_1-trisomy syndrome, however, is not identical with that in mongolism. Dermatoglyphic studies in this condition showed a displacement of axial triradius, and characteristic configuration was observed also on the soles. No characteristic patterns were observed on the fingers, however.

A third example of congenital defects with characteristic dermatoglyphic patterns is the E_{18}-trisomy syndrome, or Edward's syndrome.[5] This condition, too, is due to the presence of a supernumerary chromosome, distinct of those involved in mongolism and D_1-trisomy syndrome. In these cases, dermatoglyphic studies demonstrated the presence of arches on all or most of the fingers.

The three conditions discussed here illustrate the potential of dermatoglyphic studies in medicine. Medical researchers in several medical centers are looking for new conditions with characteristic dermal ridge configurations as well as for new applications for dermatoglyphic studies. In the coming years, we may witness many new findings along this line of medical research. Physicians must always be ready to incorporate new techniques into their diagnostic and curative procedures, of which the study of dermatoglyphics is a recent example.

HOW IMPORTANT IS THIS

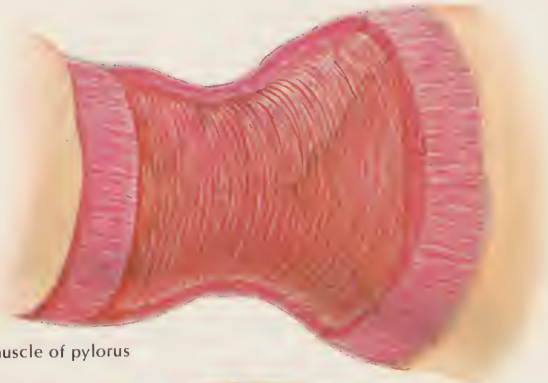
IN YOUR DIAGNOSES OF SMOOTH MUSCLE SPASM?

PERHAPS VERY IMPORTANT

The sphincter of Oddi is made up primarily of smooth muscle fibers. It permits the gall bladder to fill, regulates the flow of bile and pancreatic enzymes and in dysfunction is a primary cause of Biliary Dyskinesia. The sphincter of Oddi is but one of five major foci of smooth muscle spasm where SPACOLIN® (Alverine citrate) acts directly with rapid onset and long duration. No neurotropic side effects because Spacolin is a musculotropic counter-spasmodic unrelated to atropine or atropine-like drugs. Spacolin is not contraindicated in prostatic hypertrophy.

SPACOLIN® (Alverine citrate)

Each tablet contains: Alverine citrate ..... 120 mg.



INDICATIONS: Smooth muscle spasmolytic for use in spastic colon, spastic conditions of the gastrointestinal tract, biliary dyskinesia, cholecystitis, spasm associated with peptic ulcer,* achalasia, pylorospasm, spasm attendant to diarrhea, spastic conditions of the genitourinary tract attributable to inflammation and calculi, certain primary dysmenorrheas and as an aid in cystoscopic, esophagoscopic and gastroscopic examinations. DOSAGE: One tablet after meals 1 to 3 times daily at discretion of physician. When treating spasm associated with peptic ulcer, achalasia or pylorospasm, administer tablets ½ hour before meals. In dysmenorrhea, one tablet 3 times daily starting at onset of discomfort. PRECAUTION: Caution is recommended when using in hypotensive patients. SIDE EFFECTS: In common with other smooth muscle depressants, Spacolin temporarily lowers blood pressure.

*Antacid and dietary measures are of primary importance in ulcer treatment and should not be neglected.

Highlights

RECOMMENDATIONS REGARDING MEDICAL CARE PRESCRIPTIONS

Existing pharmacy regulations permit physicians to write prescriptions for medications which have the normal regulated dosage printed on the manufacturer's label. However, in the case of the "home remedy" type of medications, many patients can take the normal regular dosage and there is no need for the physician to repeat the dosage on the prescription blank. When the physician repeats the dosage on the prescription blank, it costs the State approximately 40 to 50 cents more for the same item. Therefore, the Council on Medical Care has recommended that local health officers ask physicians participating in the County Medical Care Program to refrain from writing directions on "home remedy" type medications when the manufacturer's recommended dosage on the label of the container is the dosage of choice. Although the regulations refer specifically to home remedies, other across-the-counter medications may be prescribed in the same manner.

HOSPITALS SURVEYED ON CIVIL RIGHTS

The Public Health Service is conducting a mail survey of all hospitals in the country to determine their state of compliance with the Civil Rights Act. This will not affect the Department's responsibility in this field, nor will it abrogate the arrangements we have made with the Public Health Service for our joint reviews and investigation of complaints. All private hospitals in the state that participate in the Department's programs and all state-owned hospitals have agreed to comply with the act.

NATIONAL HEALTH BILL SIGNIFICANT

On behalf of the Association of State and Territorial Health Officers, the Commissioner presented a statement to the Senate regarding SB 3008 (Comprehensive Health Planning and Public Health Service Amendments of 1966). From the standpoint of administering health services, this is the most significant federal legislation since 1936, when the first federal grant-in-aid program was initiated.

The proposal is predicated on the fact that health agencies are unique in their potential as centers of excellence for the delivery of health services to the public. It embodies a mechanism for progressively reducing the gap between personal and environmental health services actually available and those which can be provided by practical exploitation of existing scientific knowledge, changes in methods, and future discoveries. The proposal will require us to develop firm and practical health plans by the conjoint efforts of all of the health interests (public, private, professional, and institutional) at the local, metropolitan, regional, state, and federal levels. This planning will be comprehensive. It will include preventive as well as treatment services and environmental health services. It will take the several echelons of health services and key resources—manpower, money, and facilities—into account.

AIR WARNING SYSTEM INVOKED

Some years ago the Public Health Service established a warning system which would forecast weather conditions conducive to intensification of air pollution. These potentials occur a few times a year over a wide area. One such episode took place March 10-13. The area affected was along the Eastern Seaboard and inland, extend-

ing from New England and the Great Lakes to include North Carolina. On March 11 the northern limit had moved south to Baltimore, and the condition cleared on the 13th and 14th. During this period, sampling at the several state and metropolitan Baltimore stations was increased. While some elevation in levels of some substances was noted, no significant effect could be determined. All results have not yet been evaluated. There seemed to be no indication for an emergency procedure by the state.

NEW RADIATION PROTECTION RESPONSIBILITY

Occupational Health Division representatives met with a representative of the Atomic Energy Commission to begin negotiations for the state to assume regulatory responsibility over certain radionuclides which have been subject solely to the jurisdiction of the Atomic Energy Commission.

FAMILY PLANNING

The Bureau of Preventive Medicine is cooperating with the Johns Hopkins School of Hygiene and Public Health and the Planned Parenthood Association of Maryland in a series of one-day training sessions, two-day workshops, and two-week seminars on "Family Planning and Public Health." Open to physicians, nurses, nurse midwives, health educators, social workers, public health administrators, and other qualified professionals, the courses are being presented tuition free through the generosity of the Jessie Smith Noyes Foundation.

In anxiety states: B and C vitamins are therapy

Stress formula vitamins are an important supportive measure in maintaining the nutritional status of the emotionally disturbed patient. With STRESSCAPS, B and C vitamins are present in therapeutic amounts to meet increased metabolic demands. Patients with anxiety, and many others undergoing physiologic stress, may benefit from vitamin therapy with STRESSCAPS.

Each capsule contains:

Vitamin B_1 (as Thiamine Mononitrate)	10 mg.
Vitamin B_2 (Riboflavin)	10 mg.
Niacinamide	100 mg.
Vitamin C (Ascorbic Acid)	300 mg.
Vitamin B_6 (Pyridoxine HCl)	2 mg.
Vitamin B_{12} Crystalline	4 mcgm.
Calcium Pantothenate	20 mg.

Recommended intake: Adults, 1 capsule daily, for the treatment of vitamin deficiencies. Supplied in decorative "reminder" jars of 30 and 100; bottles of 500.

ALCOHOLISM PROGRAM

The City Health Department has issued a new pamphlet describing the procedures and services of its Alcoholism Clinic in the Eastern Health District Building. Prepared for lay distribution, the leaflet is available for physicians' use. The text of the leaflet is as follows:

TRAPPED IN THE BOTTLE? Are you one of the 60,000 people in Baltimore who have a drinking problem? Or perhaps you are a friend or relative of a problem drinker. If so, you should know that no one needs to stay trapped in the bottle because help is available at the Alcoholism Clinic.

WHO CAN APPLY FOR HELP? Baltimore City residents who have a drinking problem can apply directly to the clinic or may be referred by their doctor, clergyman, caseworker or other interested person.

WHAT DOES THE CLINIC DO? At the outset, a complete physical and psychiatric examination of the patient determines whether treatment on an outpatient basis can be started at once or whether a short period of hospitalization would give the patient a better start. After this appraisal of the patient's health, the treatment program is tailored to the individual's needs.

WHY IS HOSPITALIZATION NECESSARY? Sometimes a patient needs specialized care for medical reasons (not just for sobering up) before treatment for an alcoholism problem can begin. Such patients are sent to a hospital for treatment. As soon as his condition permits, both the patient and his spouse are consulted about future treatment on an outpatient basis.

WHAT IS THE CLINIC TREATMENT? Before treatment starts each patient receives a psychiatric and socio-economic evaluation. This enables the doctor to design a treatment program for the individual patient that can be most successful in the light of his present problems and surroundings.

Both the patient and spouse are expected to participate in the treatment program. According to the individual patient's needs, one or several of the following treatment approaches can be used: Individual or group therapy, marriage counseling, medication.

DOES TREATMENT GO BEYOND THE CLINIC? Yes. When indicated, patients may be referred to the Department of Public Welfare, Vocational Rehabilitation, Community Action Program and Alcoholics Anonymous.

WHAT HAPPENS AFTER TREATMENT ENDS? When clinic treatment is terminated both patient and spouse are contacted at regular intervals for follow-up purposes. This can be done either by a scheduled interview at the clinic or by a home visit of a public health nurse or a member of the Instructive Visiting Nurse Association.

WHERE ARE THE SERVICES AVAILABLE? At the Alcoholism Clinic, Eastern Health District Building, 620 N. Caroline Street. You may telephone 732-7110.

Copies of the above leaflet may be obtained from Mr. Harry E. Shelley, coordinator of alcoholism programs, Baltimore City Health Department, American Building, Baltimore and South Streets, Baltimore, Md. 21202; or by telephoning 752-2000, extension 842.

Physicians desiring assistance or consultation may call Abraham M. Schneidmuhl, MD, director, Alcoholism Clinic, Eastern Health District Building, 620 N Caroline Street, Baltimore, Md. 21205; telephone PE 2-7110.

1959	222,791	176,412	849,493,595	4,815.40
1961	253,005	215,600	974,838,616	4,521.51
1963	285,244	247,228	1,084,713,981	4,387.50
1965	314,443	286,989	1,201,979,234	4,188.24

THE NATIONAL SCENE

In 1965, for the fourth consecutive year, reported expenditures in the United States for the maintenance of state and county operated mental hospitals exceeded one billion dollars. This represented an increase of 6.1%, or 69 million dollars, over the previous year's comparable figure. Total maintenance costs have doubled since 1955 and are now almost one-fourth higher than they were four years ago.

Hospital expenditures have continued to go up although the average number of patients in these facilities has decreased steadily. Nationally, a decline in the patient population of 11.9% (from 554,600 to 488,400) occurred between 1955 and 1965. As a result, the average cost of caring for one patient for one day has gone up substantially. In 1955, the national daily per capita was $3.06. By 1965 this had increased 120.3% to $6.74. Despite this improvement, expenditures per patient continue to lag behind comparable figures from federal (VA) psychiatric hospitals.

While these data reflect rising personnel-patient ratios and other improvement in treatment services, they are primarily related to the rapidly increasing patient turnover resulting from shortened periods of hospitalization and the release of many long term patients. As indicated in the table, both admissions and the net number of releases have risen considerably between 1955 and 1965. In fact, this rise has been so large that the average expenditure required to produce one net release is now less than it was 10 years ago.

If present trends continue, the average daily cost per patient must be expected to rise further at the same time that the average total cost of each treatment episode declines. The only alternative to continuing, uninterrupted increases in state psychiatric hospital expenditures is to reduce the number of admissions and to decrease further the average period of hospitalization. This can be accomplished through closely coordinated programs offering a variety of community and hospital services to the mentally disturbed and through the implementation of current and new concepts for the prevention of mental illnesses.

WHAT YOU SHOULD KNOW ABOUT ENTERTAINING COLLEAGUES

WILBURN L. McCLURE, JR.

There are but three valid reasons for making plans to entertain a colleague: 1) introducing yourself, 2) expressing thanks, and, by far the most unusual, 3) common courtesy and friendship.

The method, time, or place chosen to introduce oneself, the spouse, and the family, will not prove to be the end result in itself toward making the proper impression. It will be the means, however, through which you can reveal your genuine desire to be a friend as well as a colleague.

Often the question is asked: As a doctor trying to build a practice, can I entertain colleagues without it appearing that my only purpose is to gain their referrals?

The answer is yes.

Those being entertained are intelligent enough to make referral decisions based on good medicine and certainly not because of good liquor and and hors d'oeuvres. Here are some ground rules to remember:

1. Informal meals at home should be with one couple at a time.
2. Buffet brunches or supper parties are definitely "in."
3. Cocktail parties are "out."

A pleasant meal in the comfort of your home can be one of the greatest ways to get to know someone. Relax and be yourself.

Buffet parties stimulate conversation. People will circulate more freely if the guests are limited to about eight couples. Mixing the guest list with non-physicians is a good idea.

Cocktail parties rarely prove conducive toward sincere, personal exchanges between friends. Who knows when the other fellow will be thinking that "it's just the liquor talking"?

Once you are well established, the rules change drastically. Now the purpose is to show gratitude to those directly or indirectly involved with your success. Larger, more elaborate parties will be acceptable. Having several carefully selected guests for dinner at home or away is permissible.

Caution: Let your normal personality guide your style. No one likes ostentatiousness.

What about afterwards, when you reach the point when big parties and dinners no longer thrill you? Strange as it may seem, you may wish to go back to the beginning principals, small parties and two for dinner, with the emphasis now being on good old fashioned friendship.

Full advantage should be taken of the valid deduction on your income tax returns for professional entertainment. A couple of years ago, the Internal Revenue Service cracked down on such items as entertainment. The IRS will allow deductions where you prove that the atmosphere was complimentary to the occasion. Also, you must, of course, produce an accurate accounting of the expense and a guest list.

Louis Krause, MD, Chairman
Library and History Committee

Elizabeth Sanford
Librarian

During the past months the library has been newly painted, has increased the capacity of the card catalog with the addition of a 72-drawer case, and is revising the vertical file collection.

Naturally, painting walls, shelves, and ceiling in a library causes more disorganization than in most other facilities, so if service was not as prompt as usual during March, please understand that we probably had to grope around under tarpaulins and ladders in order to find the material you requested. Next time you visit the Faculty building, come into the library and see the improvements.

Since the last Library Page appeared, a collection of new books were shown at the Cecil County meeting in Elkton and the Carroll County Medical Society meeting in Westminster in March. These meetings give the librarians a chance to get acquainted with many of the doctors who do not have an opportunity to visit the library personally, and the doctors a chance to examine new books and request particular subjects or titles which they need. We expect this practice to become more regular as the component societies realize it is an available service. Special requests sent to the library before a meeting will be brought to the meeting whenever possible.

On March 17, representatives of the hospital medical libraries in the state met in the Faculty building. About 40 people attended, predominantly from the Baltimore area. Purpose of the meeting was to discuss the needs of the hospital medical libraries in order to supply their staffs with the most up-to-date information in the most efficient manner, as well as to meet the requirements for accreditation. A number of concrete suggestions as to immediate needs developed; namely, the desire for a good audiovisual center in the state for the use of hospital and other medical libraries; a journal pool on which all the libraries could draw; and, finally, a recommendation that the best solution would be the maintenance of a strong central library to supply the needs of the smaller hospital staff libraries. Since a number of the hospitals outside the Baltimore area were not represented at this meeting, the Library and History Committee of the Faculty would be interested in hearing the reactions of their library committees. Please send any suggestions to Mrs. Sanford.

Dulaney Valley Memorial Mausoleum

Dedicated to Sacred Memories . . . By the One Who Cares, Prepares Ahead, and is Loved for it.

Dulaney Valley Memorial Mausoleum will provide a final resting place for your loved ones in surroundings of simple dignity and quiet beauty—truly a living memorial expressing your reverence and love.

Cool in summer, heated in winter, serene and peaceful in all seasons, the building's heavy granite exterior and marble interiors, built to California's earthquake specifications, will provide permanent protection for all time.

When you select individual or family entombment space in Dulaney Valley Memorial Mausoleum, you not only provide a beautiful memorial to your family, you also make a practical investment. Mausoleum entombment, as old as the pyramids, often costs less than ground burial.

It's so sensible to decide on this inevitable problem while your family is all about you—while they may have a voice in what is truly a family decision.

Too often, postponement of this important family duty results, in the end, in a hasty decision under duress. You can ease the burden by making a reservation for your family in Dulaney Valley Memorial Mausoleum, now and together, under our Builder's Program.

Dulaney Valley's liberal purchase agreement makes ownership of a crypt or crypts a simple thing, now, before the need arises.

Write today for information on single or companion crypts — private or semi-private rooms.

PHYSICIANS WANTED

Physician needed for responsible position in research and development activities of a large midwestern chemical company. Strong interest in clinical research and evaluation is desirable. Ability to communicate effectively with other medical and technical people is essential. Excellent career potential for physician interested in internal medicine or dermatology. Send resume to: Box #42 Maryland State Medical Journal. An equal opportunity employer 5

EMPLOYMENT OPPORTUNITIES FOR PHYSICIANS—The Montgomery County Health Department needs physicians to do part-time clinical work in both the Maternity and Child Health Programs. Baard-eligible pediatricians and obstetricians are preferred, but applicants with other training and experience will be considered. United States citizenship is required. One category of particular interest to applicants with pediatric training is that of "Area *Physician*." This position combines clinical and consultative experience in a broad scope Child Health service for an assigned area of the county. It includes work in health supervision clinics for all ages of children (including adalescents), management of referral cases such as those seen in the Crippled Children's Program, school medical advisary service, and consultation to the public health nurses assigned in the area. For further information, call or write to: Ruth-Alice Asbed, M.D. Chief, Maternal and Child Health Division, Montgomery County Health Department, Jefferson and Perry Streets, Rockville, Maryland 20850. Phone: 279-1627. 5

PRACTICES FOR SALE OR RENT

RETIRING GENERAL PRACTITIONER wishes to turn over his practice to competent physician willing to work for a very competent return. Well established practice in Hagerstown, Maryland, a city of 50,000 peaple, prosperous, convenient, well-located in beautiful country. Approximately one hour from Baltimore, Washington, Harrisburg, Pa. Excellent hospital facilities with hospital privileges to qualified physician. Wonderful atmosphere in which to work. Earn an excellent livelihoad while you serve. Phane RE9-0626. 7

OFFICES FOR SALE OR RENT

NORTH ARUNDEL SECTION—Office fully equipped on the Ritchie Highway. Ideally located to the North Arundel Haspital. Unlimited parking. Available on a share basis for Ob-Gyn specialist, general practitioner, or surgeon. Reasonable terms. Telephone 263-9242 in Annapolis, Maryland. 6

INTRODUCING!

A NEW CONCEPT

in

BOOKKEEPING

and

TAX SERVICES

This Service, used by hundreds of Professional men in New England, is now being introduced in Maryland.

WHAT YOU DO —

Maintain a checkbook—one which we have especially designed for Physicians

WHAT WE DO —

— we prepare MONTHLY STATEMENTS of Income and Expense

— we prepare QUARTERLY AND FINAL PAYROLL RETURNS

— we prepare and adjust QUARTERLY DECLARATIONS OF ESTIMATED TAXES

— we prepare STATE AND FEDERAL INCOME TAXES, ready for signature

— we prepare a CONFIDENTIAL COST ANALYSIS

— we relieve you of the burden of BOOKKEEPING AND TAXES and leave you free to practice medicine.

"Early in 1953 Davis and Grand undertook a review of well established practices connected with the treatment of T. vaginalis infections. For instance, it had been accepted that an acid douche should be employed. This was based on cultural studies showing that when the pH was below 5 the organisms would die. They found that the commonly used vinegar douche with a pH of 3 showed no visible effect on T. vaginalis under the microscope in 15 minutes. Both citric and lactic acid were tested with similar results. Davis then recalled that in his early treatment of T. Vaginalis infections over 30 years ago he had had his first successes with alkaline preparations, and when he returned to their use the patients reported them more soothing than the previously used acid solutions."

(Am. J. Obst. & Gynec., 68:559, 1954)

Criteria for Cleansing Douche

"Daily douching often is a part of the treatment administered in dealing with T. vaginalis and since it is possible that the solution might contain agen's that could hamper the regrowth of Doederlein bacillus, the following properties were said to be ideal.

1. It should contain a harmless, nonsensitizing detergent to remove mucous deposits and debris.
2. It should not contain any antibacterial agents, since the contact possible during douching would be so fleeting that anti-bacterial action could not be expected.
3. It should be acid in pH.

The 3rd property seems to be the most illogical and unimportant. If contact is so fleeting that antibacterial actions could not be expected, it would seem to follow that its acid quality would be of no consequence. Furthermore, acid solutions are irritating to the mucosa and oftentimes accentuate inflammation.

Actually, the value of a douche is generally conceded to be confined to its use as a cleansing and deodorizing agent. The encouraging results achieved with a detergent douche solution in treating infections of the vagina are probably attributable to the enormous normal recuperative powers of the vaginal tissues which have been under-estimated as a factor in the restoration of normal physiology.

Therefore, simple cleansing of the vagina with a non-irritating. mildly alkaline douche which is soothing to the vaginal mucosa and which penetrates and flushes out the dead organisms. debris and mucinous materials frequently enables the physiological processes to overcome the infection."

Charles B. Marek, M.D., Chief of Gynecology; Bon Secours Hospital: personal communications August 11. 1964

The weight of clinical evidence favors Librium

With Librium (chlordiazepoxide HCl), the weight of a five-year record of efficacy and safety in clinical use is supported by over 630 reports in the medical literature. Its virtually specific antianxiety action normally reduces disturbing emotional complaints promptly without compromising the patient's mental alertness or ability to perform normal functions. Decisive results are often seen in patients who had not improved on previously used psychotropic drugs.

In prescribing: Dosage—Adults: Mild to moderate anxiety and tension, 5 or 10 mg t.i.d. or q.i.d.; severe states, 20 or 25 mg t.i.d. or q.i.d. Geriatric patients: 5 mg b.i.d. to q.i.d.

Side Effects: Side effects, usually dose-related, include drowsiness, ataxia, minor skin rashes, edema, menstrual irregularities, nausea and constipation. When treatment is protracted, blood counts and liver function tests are advisable. Paradoxical reactions may occasionally occur in psychiatric patients. Individual maintenance dosages should be determined.

Precautions: Advise patients against possibly hazardous procedures until maintenance dosage is established. Though compatible with most drugs, use care in combining with other psychotropics, particularly MAO inhibitors or phenothiazines; warn patients of possible combined effects with alcohol. Observe usual precautions in impaired renal or hepatic function, in long-term treatment and in presence of depression or suicidal tendencies. Exercise caution in administering drug to addiction-prone patients or those who might increase dosage; withdrawal symptoms, similar to those seen with barbiturates or meprobamate, can occur upon abrupt cessation after prolonged overdosage. Caution should be exercised in prescribing any therapeutic agent for pregnant patients.

Supplied: Capsules, 5 mg, 10 mg and 25 mg, bottles of 50

Brewer Diagnostic Kits

Complete Serological Screening Tests For Syphilis . . .

The RPR Card Tests make use of a specially prepared, carbon-containing RPR Card antigen. The particle size and other characteristics of the carbon is such that when a reactive specimen is encountered, flocculation occurs, and there is a coagglutination which is readily visible to the naked eye. Individual tests, including the collection of blood and separation of plasma can be performed in 7 to 8 minutes.

Confirming earlier findings with the RPR Card Test[1-10] Reed[11] in reporting on 63,800 specimens had an overall agreement of 98.5% in a recent comparative study with other routine screening procedures.

The RPR Card Tests, with their low cost, ease of performance, high sensitivity and specificity, are without peer in situations that demand rapid testing of patients, enabling the physician to initiate prompt treatment of early infectious syphilis.

Specify the RPR Card Test as the screening procedure on serum or plasma samples submitted to your State Approved Laboratory.

NTZ Nasal Spray relieves hay fever symptoms on contact

Fast symptomatic relief from seasonal hay fever comes in the convenient NTZ Nasal Spray bottle. Two sprays quickly relieve itching and decongest the nasal membranes on contact. The first spray of NTZ shrinks the turbinates, helps restore normal nasal ventilation and breathing. After a few minutes a second spray enhances sinus ventilation and drainage.

NTZ Nasal Spray reduces excessive rhinorrhea without unpleasant dryness. It is well tolerated by delicate respiratory tissues. NTZ also provides relief in head colds, perennial rhinitis and sinusitis.

NTZ's carefully balanced formula relieves three ways: with a decongestant, a topical antihistamir and an antiseptic wetting agent.

Neo-Synephrine® HCl 0.5%, a decongestant of unexcelled efficacy to shrink nasal membranes.

Thenfadil® HCl 0.1%, a topical antihistamine to help relieve itching.

Zephiran® Cl 1:5000, an antiseptic wetting agent to promote the rapid spread of components to le accessible nasal areas.

NTZ is supplied in leakproof, pocket-size, spray bottles of 20 ml. and in bottles of 30 ml. with dropp

Treat yourself and your investments to professional management...

WITH AN INVESTMENT MANAGEMENT ACCOUNT AT THE TRUST DEPARTMENT OF MARYLAND NATIONAL BANK

You will be relieved of all the cumbersome details of investment management and what's more important, you can stop worrying about what to buy and sell and when to do so.

Your securities will be under the careful supervision of our Investment Department with an Investment Officer assigned to your account. This Department, backed by our Investment Research and Administrative Departments, works under the direct supervision of our Trust Committee which is composed of senior officers and directors of our Bank.

Our annual fee for an Investment Management Account is based on the income and value of your account and is surprisingly low. As it relates to taxable income, the fee is tax deductible for Federal Income Tax purposes.

Why not discuss the advantages an Investment Management Account would have for you? There is no cost or obligation.

In Baltimore, telephone 685-3900 and ask for L. Dale Marvel.

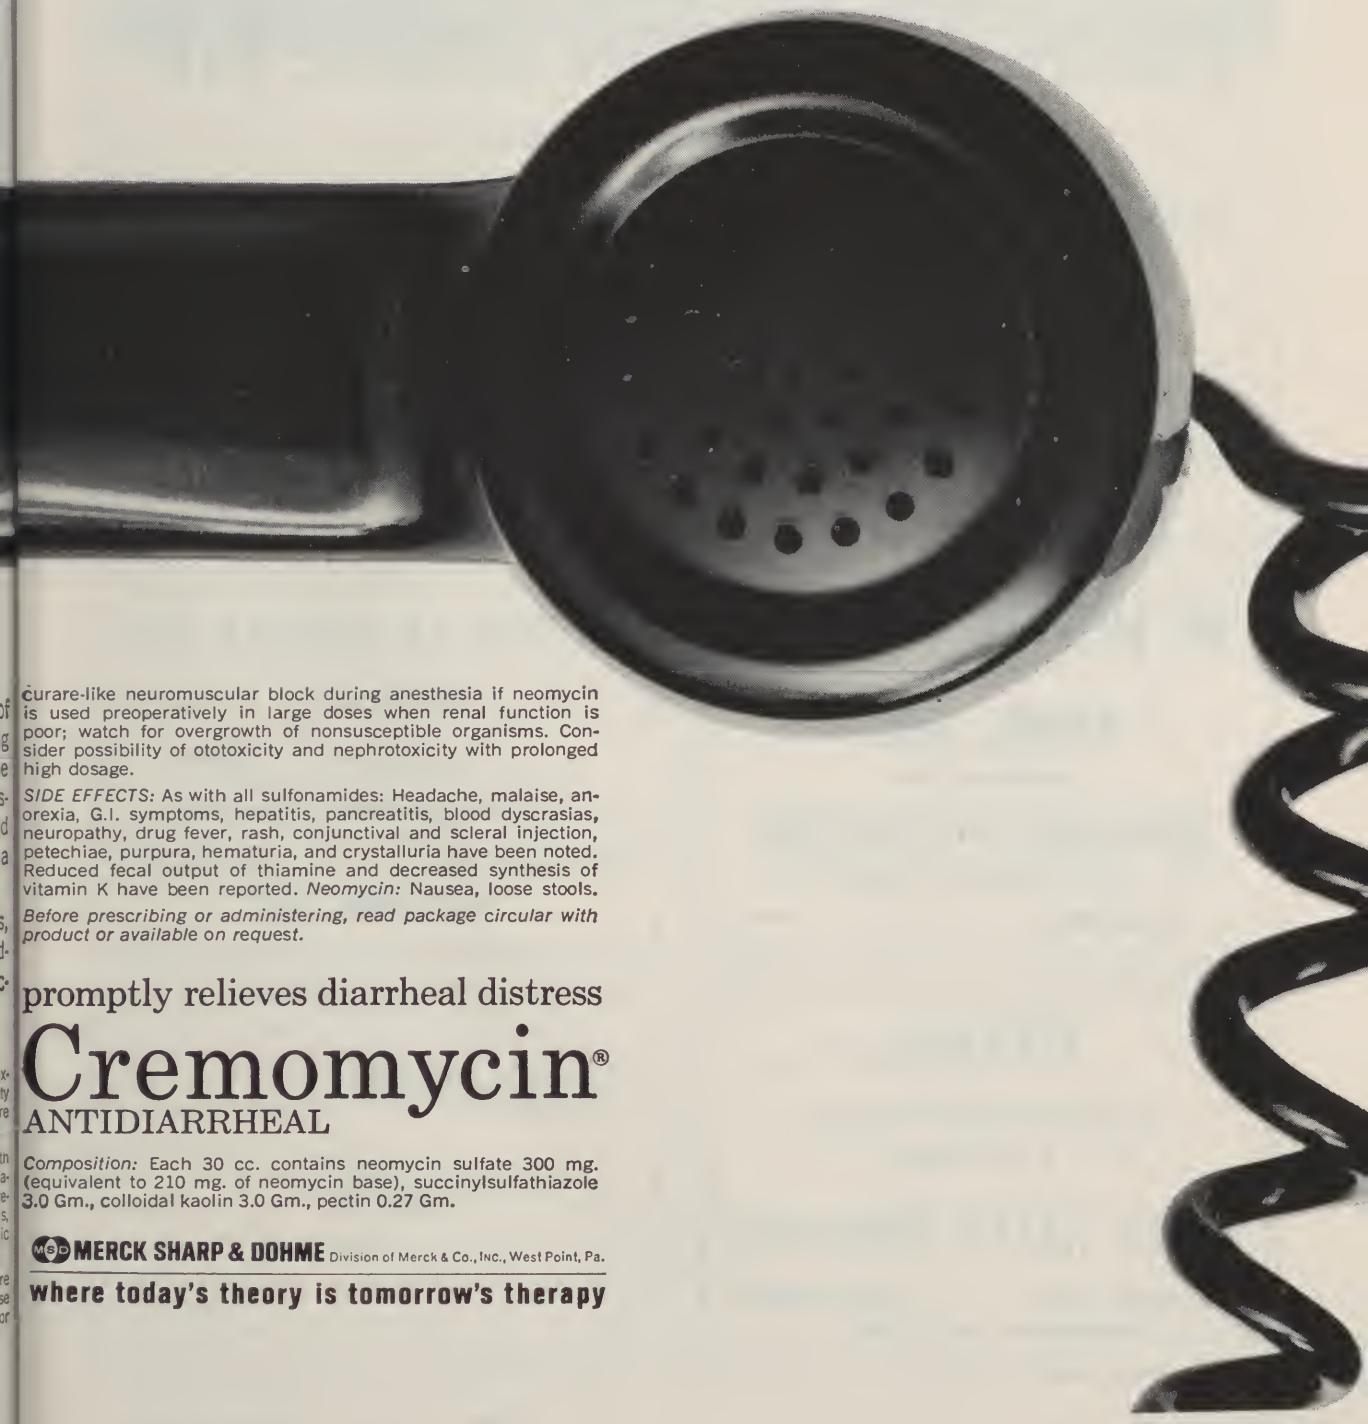
Ætna
LIFE & CASUALTY

When uncontrolled diarrhea brings a call for help

When the diarrhea sufferer has run the gamut of home remedies without success, pleasant-tasting CREMOMYCIN can answer the call for help. It can be counted on to consolidate fluid stools, soothe intestinal inflammation, inhibit enteric pathogens, and detoxify putrefactive materials — usually within a few hours.

CREMOMYCIN combines the bacteriostatic agents, succinylsulfathiazole and neomycin, with the adsorbent and protective demulcents, kaolin and pectin, for comprehensive control of diarrhea.



INDICATIONS: Diarrhea.

CONTRAINDICATIONS: Do not use in intestinal obstruction, extensive ulceration of bowel, or diverticulosis; in hypersensitivity to sulfonamides or neomycin; in pregnancy at term, in premature infants, or during first week of life in the newborn.

WARNINGS: Use only after critical appraisal in patients with hepatic or renal damage, urinary obstruction, or blood dyscrasias. Fatal hypersensitivity reactions and blood dyscrasias reported with use of sulfonamides. Consider periodic blood counts, hepatic and renal function tests during intermittent or chronic use.

PRECAUTIONS: Succinylsulfathiazole: Use with caution if there is history of significant allergies and/or asthma. Continued use requires supplementary vitamins B_1 and K. *Neomycin:* Watch for

your ℞ for Cremomycin can provide relief

curare-like neuromuscular block during anesthesia if neomycin is used preoperatively in large doses when renal function is poor; watch for overgrowth of nonsusceptible organisms. Consider possibility of ototoxicity and nephrotoxicity with prolonged high dosage.

SIDE EFFECTS: As with all sulfonamides: Headache, malaise, anorexia, G.I. symptoms, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, rash, conjunctival and scleral injection, petechiae, purpura, hematuria, and crystalluria have been noted. Reduced fecal output of thiamine and decreased synthesis of vitamin K have been reported. *Neomycin:* Nausea, loose stools.

Before prescribing or administering, read package circular with product or available on request.

promptly relieves diarrheal distress

NORTH CHARLES GENERAL HOSPITAL OPENING NEW 75-BED WING

BUCHART ASSOCIATES—ARCHITECTS & ENGINEERS—BALTIMORE, MD. & YORK, PA.

North Charles General Hospital is doubling its patient care area with the opening of a new 75-bed wing this month. It will contain private and semi-private rooms, as well as a new x-ray unit and equipment.

A new educational suite will also occupy the new quarters. This will consist of a lecture room seating 125 persons, a medical library, and offices for the staff secretary and the Director of Medical Education.

Included in the $750,000 expansion program are alterations to the present hospital building, at Charles and 28th Streets. This includes a new pediatric unit, an intensive care unit, and a new cystoscopic room.

As part of its modernization program, the hospital has reorganized its out-patient department and has expanded its special services.

With several of the downtown hospitals having moved to the suburbs, North Charles General Hospital has had a larger patient load. Because many of its patients are of the working class, the hospital has tried to combine high-level care with low cost.

Buchart Associates, architects and engineers, designed the new addition. Frank F. Favazza & Son, Inc., general contractors, did the building. Other products and services were provided by the firms shown on this and the facing page.

Not if it is V-Cillin K.

V-Cillin K now has a unique glossy coating that banishes bitter penicillin taste and makes it easier to swallow. Within six seconds (just long enough for the tablet to get past the taste buds), the coating dissolves and the penicillin is ready for immediate absorption into the bloodstream. The patient still gets all the special benefits of V-Cillin K, including consistent dependability . . . even in the presence of food.

Indications: V-Cillin K is an antibiotic useful in the treatment of infections caused by streptococci, pneumococci, and sensitive strains of staphylococci.

Contraindications and Precautions: Although sensitivity reactions are much less common after oral than after parenteral administration, V-Cillin K should not be administered to patients with a history of allergy to penicillin. As with any antibiotic, observation for overgrowth of nonsusceptible organisms during treatment is important.

Usual Dosage Range: 125 mg. (200,000 units) three times a day to 250 mg. every four hours.

Supplied: Tablets V-Cillin K, 125 or 250 mg.; also, V-Cillin K, Pediatric, 125 mg. per 5-cc. teaspoonful, in 40, 80, and 150-cc.-size packages.

Crusaders Against Quackery

"Physicians, as conservators of the public health, are bound to bear emphatic testimony against quackery in all its forms."

Is this a quote from proceedings of the American Medical Association's clinical convention in Philadelphia in December?

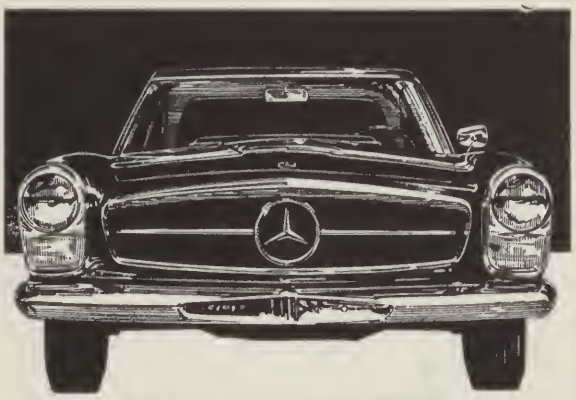
The meeting was in Philadelphia, but the year was 1847. From its very inception 118 years ago, the American Medical Association has been battling quackery and is dedicated to continue this warfare against wasting the nation's health and its health care dollar, of fighting fraud at the bedside of ill and desperate people.

As long as there are human beings, there will be human nature—and quacks, pretenders to ability they don't possess, to take advantage of the fact.

The health quack is not easy to spot these days. The stovepipe hat and the pitchman's hawking have gone. Their space-age counterparts are suave, sophisticated-appearing super salesmen with the Madison Avenue manners. These merchants of menace, more insidious and unscrupulous than ever, have many new products, worthless diet fads, worthless food supplements, worthless cosmetic devices and treatments, worthless "cures" for everything —even for brain-damaged children and other mental illness.

They bilk the undiscerning, the uninformed, the desperate, the unsuspecting of all ages of millions of dollars a year. The estimates of the costs of medical quackery are at best calculated guesses, but they have gone as high as a billion dollars a year. One authority in the field of quack-fighting has said, "Medical quackery each year costs more lives than all crimes in the United States."

It is this cost of life—and health—that has placed America's physicians in the front lines of the war on quacks. It is the insidious side effect of quackery with which medicine concerns itself—the delay in proper medical care that may cost life itself. It is for this reason, too, that the medical profession is dedicated to educating people about cultism—chiropractic and the other health sects that turn their backs on scientific medicine.



The House of Delegates of the American Medical Association said in 1933:

> Either the theories and practices of scientific medicine are right and those of the cultists are wrong, or the theories and practices of the cultists are right and those of scientific medicine are wrong.

And in 1961, it said, "There can never be a majority party and a minority party in any science . . ."

After the quack or the cultist has extracted his pound of flesh, after the damage is done and the sick may have become the dying because of the delay in proper care, scientific medicine usually is called upon to pick up the pieces. Medicine has tried and will continue to try to do that job, too; but how much easier the job would have been, how many lives would have been saved, IF. . . .

From the AMA Department of Investigation.

EXECUTIVE SECRETARY'S NEWSLETTER

June, 1966

NEWS NOTES

Martin L. Singewald, M.D., Baltimore, has been elected the Maryland representative of the American College of Physicians.

New Maryland Society of Anesthesiologists Officers are: Walter Dandy, M.D., President; Martin I. Gold, M.D., President-elect; Harold Eccleston, M.D., Vice-president; Gerald Carroll, M.D., Secretary; and Albert Pats, M.D., Treasurer.

Henry N. Wagner, Jr., M.D., has been named President-elect of the American Federation for Clinical Research.

William K. C. Morgan, M.D., is new President of the Maryland Thoracic Society.

Harry M. Robinson, Jr., M.D., is the new President of the Maryland Dermatological Society with William R. Bundick, M.D., being named Secretary.

Robert T. Adkins, M.D., Salisbury, is the new President of the Heart Association of the Lower Eastern Shore.

MEDICARE REMINDER

With the advent of July 1, physicians will be seeing patients who are covered under Medicare, Title 18 of PL 89-97. If such physicians complete the Social Security form for payment for services rendered to patients under this program, they should be mailed to Blue Shield, the fiscal administrator for this program. For those beneficiaries who are covered under the Railroad Retirement program, such forms should be mailed to the local office of the Travelers Insurance Company, the fiscal administrator for Railroad Retirees and Dependents.

MORE INFORMATION

Persons formerly over 65 and covered under the Medical Assistance to the Aged program in Maryland may have purchased Part B of Title 18, PL 87-97. In such cases, their former MAA

card is no longer valid with respect to payments to physicians. Some persons, however, may not have purchased Part B, in which case the former MAA card still holds as does the payment schedule under this program.

PERSONALITIES

Isadore A. Siegel is the new President of the Maryland Obstetrical and Gynecological Society of Maryland.

REFERENCE COMMITTEE MEETING

The Reference Committee is scheduled to meet on

THURSDAY, JULY 28, 1966 at 8:00 p.m.

in the Faculty Building.

JULY 28, 1966

As of the writing of this Newsletter, the following resolutions have been received in the Faculty Office prior to the deadline date of July 15. Committees, members and Component Societies have until this date to submit resolutions for consideration at the Semiannual Session, September 9, 1966, in Ocean City.

Resolution 1S/66 - Changes in the Medical Practice Act to Permit Hospitals Associated with Medical Schools to Practice Medicine

Resolution 2S/66 - Liaison Committee to Screen All Requisition Forms of Maryland State Department of Health; Bureau of Laboratories; Insurance Companies; and Blue Cross and Blue Shield, so as to recommend Elimination of Unnecessary Detail

Resolution 3S/66 - The Medical & Chirurgical Faculty Request the State Health Department to Rescind its Action in Excluding the Practicing Physician's "Screening Activity" from Use of State Laboratory Facilities

Anatomy of
Low Back Pain #1

the sedentary life is often the seat of low back pain

The human spine is not engineered for prolonged sitting at desks, pianos, typewriters and drafting boards. The stresses set up by the heavy, forward-tilted head and trunk, balanced precariously on an insufficient base, result in strain of the dorsal musculature, particularly at the low lumbar level.

The unusual muscle-relaxant and analgesic properties of 'Soma' make it especially useful in the treatment of low back sprains and strains. 'Soma' is widely prescribed ☐ **to relieve pain** ☐ **to relax muscles** ☐ **to restore mobility.**

Indications: 'Soma' is useful for management of muscle spasm, pain, and stiffness in a variety of inflammatory, traumatic, and degenerative musculoskeletal conditions. It also may act to normalize motor activity in certain neurologic disturbances.

Contraindications: Allergic or idiosyncratic reactions to carisoprodol.

Precautions: 'Soma', like other central nervous system depressants, should be used with caution in patients with known propensity for taking excessive quantities of drugs and in patients with known sensitivity to compounds of similar chemical structure, e.g., meprobamate.

Side Effects: The only side effect reported with any frequency is sleepiness, usually on higher than recommended doses. An occasional patient may not tolerate carisoprodol because of an individual reaction, such as a sensation of weakness. Other rarely observed reactions have included dizziness, ataxia, tremor, agitation, irritability, headache, increase in eosinophil count, flushing of face, and gastrointestinal symptoms.

One instance each of pancytopenia and leukopenia, occurring when carisoprodol was administered with other drugs, has been reported, as has an instance of fixed drug eruption with carisoprodol and subsequent cross reaction to meprobamate. Rare allergic reactions, usually mild, have included one case each of anaphylactoid reaction with mild shock and angioneurotic edema with respiratory difficulty, both reversed with appropriate therapy. In cases of allergic or hypersensitivity reactions carisoprodol should be discontinued and appropriate therapy initiated. Suicidal attempts may produce coma and/or mild shock and respiratory depression.

Dosage: Usual adult dose is one 350 mg. tablet three times daily and at bedtime.

Supplied: Two Strengths: 350 mg. white tablets and 250 mg. orange, two-piece capsules.

Before prescribing, consult package circular.

for the relief of low back sprains and strains

Your MEDICAL FACULTY at Work

JOHN SARGEANT — EXECUTIVE SECRETARY

EXECUTIVE COMMITTEE, APRIL 14

1. The AMA is to be asked to reevaluate continued use of the TWX machine, as the number of messages sent and received is small and, proportionately, the cost per message high.

2. Faculty participation in the Albert E. Goldstein Memorial Fund was approved, provided that the Faculty's Program and Arrangements Committee has final approval with respect to presentation of any lectureship at any Faculty meetings.

3. Recommendations were made for gubernatorial appointments to the following boards and councils: Board of Physical Therapy Examiners, Advisory Council on Hospital Construction, and Advisory Board on Hospital Licensing.

4. Financial contributions were approved to the University of Maryland Chapter, Student AMA, and the Maryland League for Nursing.

5. Approval was given to mailing copies of the minutes of Executive Committee and Council meetings to the presidents of component societies.

COUNCIL, APRIL 26

1. 1966 dues were waived for a Baltimore City physician who is ill.

2. Emeritus membership is to be recommended for Robert Henin, MD, Baltimore County, and Simon Virkutis, MD, Dorchester County.

3. Physicians' defense was ratified for one member but denied to another member who paid his dues after the specified deadline.

COUNCIL, APRIL 29

1. Russell S. Fisher, MD, was elected Council chairman; J. Emmett Queen, MD, vice chairman.

2. A motion was adopted to appoint a committee to investigate and report to the Council reputed attempts of certain universities to discourage the entrance of medical students into general practice.

THE DRUG TO LOWER CHOLESTEROL...

NICALEX®

(ALUMINUM NICOTINATE)

- ☐ Reduces cholesterol by 15-30% in most patients[2]
- ☐ Matches nicotinic acid in effective reduction of elevated serum lipids—but with minimized tendency to cause flushing[3]
- ☐ Simpler, more practical than diet[1]

WALKER *Laboratories*

Division of Richardson-Merrell Inc., Mount Vernon, New York 10551

NICALEX Prescribing Information. COMPOSITION: Each tablet contains: Aluminum Nicotinate 625 mg.—a complex consisting of (approx.): Aluminum Hydroxydinicotinate 450 mg. and Nicotinic Acid 155 mg. (Equivalent in activity to Nicotinic Acid 500 mg.) INDICATIONS: The primary indications for NICALEX (Aluminum Nicotinate) are to reduce the serum cholesterol and total lipid levels in hypercholesteremia and hyperlipemia. It may also be useful in reducing xanthomatous tissue cholesterol deposits. PRECAUTIONS AND WARNINGS: Patients with peptic ulcer, liver, or gallbladder disease should be observed closely while taking the medication. Diabetic patients may require adjustment of diet and insulin dosage in the event of decreased tolerance. Patients receiving anti-hypertensive drugs of the adrenal-blocking type should be watched for signs of postural hypotension. Occasional side effects of Nicotinic Acid in large dosage are decreased glucose tolerance (resembling diabetic-type curve) sometimes with glycosuria, temporary activation of peptic ulcer, transient jaundice, and metabolic disturbance of liver function without definite hepatic pathology. These side effects were found to be reversible upon discontinuing nicotinic acid therapy. Certain transitory skin changes have been observed with nicotinic acid therapy. These include: dryness of the skin and keratosis nigricans, particularly in axillae. SIDE EFFECTS: Administration of NICALEX (Aluminum Nicotinate) may produce temporary flushing and pruritus, also mild gastrointestinal distress, but these reactions are transient and apparently not serious. DOSAGE: The adult dose is 2 to 4 tablets t.i.d. with meals. HOW SUPPLIED: In bottles of 100 and 1000. CAUTION: Federal law prohibits dispensing without prescription. REFERENCES: 1. Parsons, W.B., Jr., Mayo Clin. Proc., 40:822, 1965. 2. Goldsmith, G.A., Amer. J. Dig. Dis., 9:651, 1964. 3. Boyle, E., Jr., J. Amer. Geriat. Soc., 10:822, 1962. U.S. Patent 2,970,082

Treatment of Hypertensive States

R. PATTERSON RUSSELL, MD

Who will benefit from treatment? In whom is treatment contraindicated? What therapeutic agents should be used?

I would like to emphasize, first, the importance of careful clinical evaluation and appropriate radiographic, blood, and urinary studies. If treatment is started before these studies are carried out, it becomes difficult to establish a diagnosis of primary hyperaldosteronism or pheochromocytoma. These basic studies provide not only a background for the diagnosis but also a point of reference as one treats the hypertensive patient over the ensuring years.

If we examine the distribution of blood pressure in the general population, two points emerge. There is a definite difference in the way the blood pressure is distributed, first with age and second between the sexes. The systolic and diastolic pressures rise with age in both sexes; the levels tend to be higher in females at any age. There also is a difference in the way the systolic and the diastolic pressures behave with age: the systolic rises much more sharply than the diastolic pressure.

With this in mind, let us consider whom to treat. To begin with, there are three rather urgent situations which require hospitalizing the patient: the malignant phase, hypertensive encephalopathy, and acute left ventricular failure.

We need only compare treated and untreated series of malignant hypertension to be convinced of this point the need to treat these conditions. Treatment has increased the survival figures from 10% to 60% one year after the diagnosis, and from 1% to 30% three years after diagnosis. Treatment must be instituted before renal function has been impaired if the patient is to derive the full beneficial effect of therapy. It behooves us, as physicians, to diagnose and treat malignant hypertension as early as possible.

Hypertensive encephalopathy is a unique situation which generally occurs when the blood pressure rises acutely. It is most commonly seen in acute nephritis, the malignant phase, or toxemia of pregnancy. Here again, the need for immediate therapy is obvious. The same may be said for acute left ventricular failure when it occurs in a setting of sustained hypertension.

More commonly, the physician must deal with patients who are beginning to show evidence of complications attributable to their high blood pressure. Target areas such as the eye grounds, heart, kidneys, and central nervous system must be carefully checked. As complications develop they are themselves indications for treatment.

Harvey Grant Beck Memorial Lecture, presented before the Medical and Chirurgical Faculty of the State of Maryland, April 23, 1965.

The appearance of retinopathy demands therapeutic intervention and may be the first warning of malignant hypertension. Chronic congestive heart failure, one of the commonest complications encountered by hypertensive patients, responds well to hypotensive therapy. With a history of coronary insufficiency or myocardial infarction, the approach is not as vigorous but is definitely warranted. Most patients with coronary insufficiency will respond to an effective lowering of the blood pressure without a worsening of their angina.

Renal impairment does not contraindicate hypotensive therapy, although it certainly demands a cautious approach. Abrupt lowering of the blood pressure in patients with renal insufficiency may worsen the situation. Most patients with cerebrovascular accidents tolerate blood pressure reduction, though in the elderly, the degree of reduction is smaller and must be attempted with more care lest the cerebral blood flow be further reduced and accompanied by a worsening of symptoms.

In some situations treatment is contraindicated, particularly in the patient who has gross mental deterioration and is unable to follow an effective therapeutic regimen. Toxemia of pregnancy begets concern for the survival of two individuals, the mother as well as the infant. Hence, the blood pressure levels that one selects to initiate treatment are considerably lower than in other hypertensive conditions.

The most vexing and by far the commonest problem that faces the clinician today is the hypertensive patient who has no complications whatsoever. Frequently, these patients are entirely asymptomatic. Sometimes they have symptoms such as lightheadedness, vertigo, tinnitus, fatigue, a sense of nervousness, or flushing sensation. But these are not of sufficient merit to warrant treatment. In the absence of complications, the level of blood pressure must at some point become an indication for therapy. Pickering has suggested that if at the ages listed, the diastolic pressure is persistently at or above the following levels, then therapy is indicated.

DIASTOLIC PRESSURES JUSTIFYING CHEMOTHERAPY

Age	*Male*	*Female*
under 40	105	115
40-49	115	120

These figures take into account the effect of age on the blood pressure and emphasize that hypertension is tolerated much better in women than in men. They are to be interpreted as a general guide and may be modified by a host of factors. In particular, therapy may be instituted at a lower level of blood pressure if there is a strong family history of hypertension with premature death, or if a patient begins to show signs of progressive vascular disease. If the blood pressure does not fulfill these criteria and it is decided to withhold therapy, the patient must be carefully watched for development of more significant hypertension or manifestations of complications which warrant therapy.

Just as it is important to know whom to treat, it is equally important to know whom not to treat. First are the young labile hypertensives without complications or symptoms whose blood pressure is in the range of 150-160 systolic over 90-100 diastolic. These patients deserve an initial evaluation which can serve as a baseline upon which they can be followed at six-month to yearly intervals. Evidence that these patients need to be started on therapy at this juncture is not convincing. The course of hypertension is so variable that it is impossible to predict who is going to develop complications. The situation should be explained to these young patients, and they should be followed regularly.

Another group comprises the elderly arteriosclerotic patients with predominantly systolic hypertension. These patients often do poorly on antihypertensive medications and sometimes get into a great deal of difficulty. A little sedation is generally effective, but if an antihypertensive medication is necessary, it should be a mild one. Gross mental deterioration from a cerebrovascular accident or other cause is generally a good contraindication for therapy. Finally, there are patients who, by reason of their employment, or personality, simply find it unacceptable or impractical to come to a doctor. These patients, if they do have sufficient indications for treatment, should be recommended for sympathectomy.

Having resolved the problem that therapy is necessary, what antihypertensive agents are available, and how are they employed? Table 1 groups the most commonly used antihypertensive drugs, explains their mode of action, and lists untoward side effects. Group 1 compounds are mild hypotensive drugs when used alone. They are also unique in the ease with which they may

TABLE 1

ANTIHYPERTENSIVE DRUGS

Group	Mode of Action	Untoward Effects
I		
A. Saluretic agents CHLOROTHIAZIDE (Diuril)	Initial effect due to decrease in intravascular volume. Mechanism of prolonged effect not understood.	Potassium depletion, hyperuricemia, gouty arthritis, hyperglycemia, thrombocytopenic purpura.
B. Rauwolfia preparations RESERPINE (Serpasil)	Depletion of catecholamine and serotonin in brain and of noradrenaline in blood vessels' walls, heart, and sympathetic ganglia.	Mental depression, nasal stuffiness, weight gain, bradycardia.
II		
A. ALPHA-METHYLDOPA (Aldomet)	"False - transmitter" effect depresses the level of sympathetic nervous function.	Drowsiness, dry mouth, depression, fever, impairment of liver function.
B. HYDRALAZINE (Apresoline)	Decreases total peripheral resistance through some peripheral action and increases cardiac output.	Headaches, tachycardia, palpitations. Syndrome clinically indistinguishable from acute disseminated lupus erythematosus.
C. MONAMINE OXIDASE INHIBITORS (Eutonyl)	Depressed sympathetic activity. Site of block not known.	Exogenously administered amines as are commonly found in cheese, beer, and broad beans may cause severe hypertensive reactions.
III		
A. Adrenergic blocking agents GUANETHEDINE SULFATE (Ismelin)	Interferes with the release or promotes the depletion of noradrenaline at the nerve endings.	Postural and exertional hypotension, congestive heart failure, nasal stuffiness, diarrhea, inhibition of ejaculation in males.
B. Ganglion blocking drugs MECAMYLAMINE (Inversine)	Competitive inhibition of acetylcholine at sympathetic and parasympathetic ganglia.	Postural and exertional hypotension, constipation, ileus, diarrhea, urinary retention, dryness of mouth, blurring of vision, impotence.
IV		
A. INTRAVENOUS TRIMETHAPHAN CAMSYLATE (Arfonad)	Same as ganglion blocking drugs.	Rapidity of action requires close monitoring, hypotension. All the side effects of ganglion blocking drugs when used beyond 24-48 hours.
B. PARENTERAL RESERPINE (Serpasil)	Same as rauwolfia preparations.	Postural hypotension, excessive sedation.

TABLE 2

PREFERENTIAL TREATMENT SCHEDULE

Clinical Condition	Drug of Choice	Usual Daily Dose Initial	Maintenance
Uncomplicated mild hypertension—(diastolic 110)	Chlorothiazide (Diuril)	0.5-1.0gm bid	0.25-0.5gm bid
Uncomplicated moderate hypertension—(diastolic 130)	Chlorothiazide (Diuril) and/or	0.5-1.0gm bid	0.25-0.5gm bid
	Reserpine (Serpasil) and/or	0.25mg tid weeks 1, 2, and 3	0.25mg qd thereafter
	Hydralazine (Apresoline)	5mg qid	25-50mg qid
Congestive heart failure	Chlorothiazide (Diuril) and/or	0.5-1.0gm bid	0.25-0.5gm bid
	Alpha-Methyldopa (Aldomet) and/or	250mg tid	250-750mg tid
	Reserpine (Serpasil)	0.25mg tid weeks 1, 2, and 3	0.25mg qd thereafter
Malignant hypertension or Failure of 1-3 to respond to treatment.	Guanethedine Sulfate (Ismelin) and	10-25mg qd	10-400mg qd
	Chlorothiazide (Diuril)	0.5-1.0gm bid	0.25-0.5gm bid
Encephalopathy	Intravenous Trimethaphan Camsylate (Arfonad) or	Approx. 4mg/min	
	Parenteral Reserpine (Serpasil)	0.5-2.5mg	

be combined with and potentiate the action of all compounds from Groups 2 and 3. Group 2 compounds are slightly more effective when used alone, are associated with more side effects, and are commonly combined with Group 1 but rarely with Group 3. Group 3 compounds are the most potent hypotensive drugs. These are associated with more extensive side effects, particularly postural hypertension. Group 4 compounds are administered parenterally or intravenously and preferably in the hospital, where the patient can be closely observed. While there is no set pattern for the treatment of hypertension, the physician who has mastered the use of one drug from each group will be prepared to lower effectively the blood pressure in most situations he encounters.

Successful treatment of hypertension requires individualization and flexibility. No one drug is effective for all patients, and a succession of regimens often must be tried before the most effective one is discovered. With few exceptions, treatment is usually initiated with the milder antihypertensive agents, such as chlorthiazide and reserpine. If the reduction in blood pressure is inadequate then other compounds may be added. Table 2 outlines the choice of drugs with the initial and maintenance dose in a variety of clinical situations.

In view of the frequency with which thiazide diuretics are prescribed in the treatment of hypertension today, it is well to be aware of their side effects. Hypokalemia, hyperuricemia, hyperglycemia, and thrombocytopenia have been reported after administration of the thiazide derivatives. The hyperuricemia rarely leads to attacks of gouty arthritis, and the hyperglycemia is a manifestation of impaired carbohydrate toler-

ance. Most recently, a number of cases of circumferential, stenotic, ulcerating lesions of the small bowel have been reported in patients receiving enteric-coated potassium chloride alone or in combination with thiazide diuretics. When potassium is required, a diet containing potassium-rich foods should be considered first. If this is not sufficient, uncoated 0.3gm potassium chloride tablets or 10 to 20% solutions of potassium chloride should be used. Potassium combinations are potentially harmful and are probably not as effective as the solution or the uncoated and uncombined form in providing potassium for the patient.

In contrast to the more commonly used but less potent saluretic agents, adrenergic blocking drugs are the most effective and most potent compounds available today. Guanethedine is a long-acting drug, the use of which must be highly individualized. Postural hypotension is a natural but nevertheless limiting effect. Congestive heart failure may develop, apparently due to depletion of catecholamines from the myocardium. Nasal blockage, diarrhea, and inhibition of ejaculation in males are signs of unopposed parasympathetic activity.

In answer to the question, "Why do we treat?" many studies demonstrate an increased survival. In the benign forms of hypertension this is harder to document because of the time span over which the condition extends. In malignant hypertension there is, in addition to the improved survival, a regression of retinopathy, in many instances a reduction of heart size and return of the electrocardiogram toward normal, and a healing of the arteriolonecrotic lesions of the kidney.

In closing, it seems proper to consider the question of timing as to when treatment is instituted. In the acute situation, the patient should be hospitalized and the blood pressure immediately reduced. Diagnostic studies are delayed until the blood pressure is effectively controlled. In hypertension with and without complications, proper evaluation and diagnostic studies precede treatment and therapy is instituted only if the appropriate indications are present.

Intravenous Regional Analgesia

Intravenous regional anesthesia was used in 17 cases involving surgery of the upper limb. It provided a satisfactory degree of anesthesia in 14 cases, failed in two cases, and required meperidene supplementation in one case.

PURIFICACION EZPELETA, MD
JOHN W. PEARSON, MD
JOSEPH S. REDDING, MD

In 1908, August Bier of Germany described his technique of "venous anesthesia" for the alleviation of pain in an extremity. He produced analgesia by expressing the blood from a limb by means of an Esmarch bandage, applying a tourniquet, and injecting a solution of local anesthetic agent into a vein. He was able to maintain analgesia for as long as two and a half hours.

Recently interest in this technique has been revised.[1,2] The principle involved in intravenous regional anesthesia of the extremity is the injection of a volume of dilute anesthetic solution into a vein after as much blood as possible has been expressed from the venous system and a tourniquet applied to prevent the inflow of arterial blood. The site of action of the anesthetic solution is uncertain. It may act proximally in the limb in the vasa nervorum or it may act by diffusing throughout all the tissues by retrograde flow through the veins.

A number of techniques are in use for producing satisfactory analgesia of an extremity by means of blocking peripheral nerves with local anesthetic solutions. Good results with these peripheral nerve blocks require the development of considerable skill and experience by the anesthetist. Consequently we were interested to learn whether equally satisfactory results might be obtained by less experienced persons using intravenous regional analgesia.

We would like to report a small preliminary series of 17 cases involving surgery of the upper limb. The anesthesias were performed by residents in training, so that our experience might be considered comparable to that of physicians in practice who undertake this procedure for the first time.

As in any situation where local anesthetics are to be injected in quantities approaching the upper limit of safe dosage, all necessary equipment for resuscitation was immediately available, a blood pressure cuff was applied, and an intravenous infusion was set up. An intravenous catheter was placed securely in a vein of the extremity to be anesthetized, and two tourniquets were placed as high up toward the axilla as possible but were not inflated. The whole extremity was drained of blood by wrapping tightly an Esmarch rubber bandage from the tips of the digits all the way up the extremity (Fig 1). The higher tourniquet was then inflated to approximately 250mm Hg pressure and the Esmarch bandage removed. After a delay of 5-10 minutes, 20 to 40ml of 0.5% lidocaine (about 1.5 mg/kg body weight) was injected through the catheter (Fig 2). Anesthesia usually occurred within five minutes. When it was evident that the anesthesia was complete and satisfactory, the catheter was removed from the vein. At this time the lower tourniquet was inflated and the higher tourniquet was released. The surgical field was then prepared for operation (Fig 3).

Of the 17 cases, 14 received an entirely satisfactory degree of anesthesia. There were two complete failures, and in one instance the anesthesia was described as being fair (intravenous meperiedine supplementation was necessary). In one of the two cases where anesthesia was unsatis-

From the Department of Anesthesiology, Baltimore City Hospitals.

Fig 1

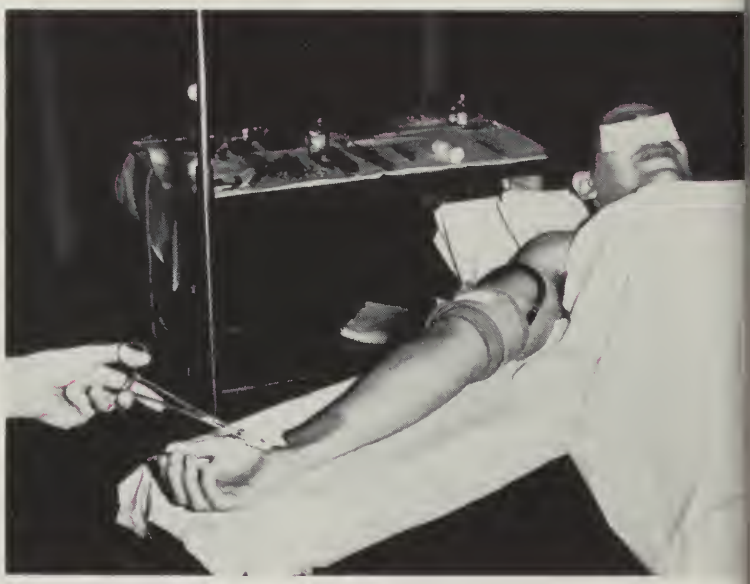

Fig 3
Preparation of surgical field after anesthesia has become established, lower tourniquet has been inflated, and higher tourniquet deflated.

factory the limb had not been well drained of blood before the tourniquet was inflated. This was in a patient who had a compound fracture of the wrist and it was not practical to apply the Esmarch bandage. In this case there was transitory anesthesia about two minutes after injection of the solution, but the anesthesia disappeared completely in the next three or four minutes. In the other unsatisfactory case there was a leak of one of the tourniquets, and although anesthesia had been achieved, the limb became flooded with blood and anesthesia disappeared. Thus strict attention to detail and careful checking of equipment are essential since the technique must be precise in order to insure success.

Anesthesia using this technique will last as long as the tourniquet is kept inflated. Full sensation returns within a few minutes after the tourniquet is released. Consequently the duration of anesthesia is limited to that period during which arterial inflow to the limb may be safely occluded. Two hours of tourniquet time is generally considered to be maximal. Discomfort from the tourniquet was a problem in only one patient. This absence of tourniquet pain was due to the use of a two tourniquet technique. The lower tourniquet was inflated only after anesthesia had been achieved distal to the higher tourniquet. In our cases the tourniquet was inflated for five to ten minutes before injection of the anesthetic mixture. Bell[2] reported most satisfactory results with a waiting period of 20 minutes between inflation of the tourniquet and injection of a local anesthetic solution. This long wait probably leads to considerable discomfort for the patient before the anesthetic is injected. Injection of a local anesthetic immediately after inflation of the tourniquet, on the other hand, leads to less profound anesthesia.

Total dosage of 0.5% lidocaine varied somewhat. Two patients received less than 25ml, four patients received 26-34ml, and 11 patients received 35-40ml. We were concerned at first that release of the tourniquet at the end of anesthesia might be accompanied by symptoms of toxicity because of the relatively sudden flooding of the vascular system with local anesthetic solution. Although the total dose of lidocaine would seem to be within the limits of safe dosage for infiltration purposes, a total of up to 200mg might well be unsafe if suddenly released into circulation. In this series we noted no changes suggestive of excitement or preconvulsive prodromata. The only changes which occurred on release of the anesthetic solution into circulation was a drop of 10mm Hg in systolic pressure in one patient after release of the tourniquet; four patients showed a decrease of pulse rate by 5-10 beats/minute. All other patients showed no signs that could be related to the local anesthetic solution.

The advantages and disadvantages of this method should be considered in deciding whether the technique deserves to be revived. Among the advantages of the technique are the following: little manual dexterity is necessary for its performance, since it can be achieved by anyone capable of making a venipuncture. No direct trauma to nerves is involved. There is no danger of puncture of the lung for anesthesia of the upper extremity. Recovery from the anesthesia is quick, so that the surgeon can be satisfied early of the results of his repair of tendons, and the patient can be of assistance in indicating any untoward symptoms.

The two disadvantages of the technique are most obvious. The first is that the duration of anesthesia is limited by the time which the surgeon and anesthesiologist deem prudent to keep the tourniquet inflated. Second, in patients with painful injuries of the extremity, the use of the Esmarch bandage causes considerable discomfort or may be impossible. Anesthesia is unsatisfactory without the Esmarch bandage.

We conclude that intravenous regional anesthesia is a safe and simple method for producing anesthesia of an extremity without the need for special training or great skill; however, it does require strict attention to detail. It is particularly useful for short procedures where a bloodless field for the surgeon is a requirement. It is probably not the anesthesia of choice when the surgical procedure will be protracted, when a tourniquet is undesirable, and when there is a fracture or other painful condition of the limb. This method of regional analgesia is a complement to axillary or supraclavicular block; not a substitute.

A New Rapid Serologic Screening Test for Syphilis

In an evaluation of 10,279 samples of either serum or plasma employing the Pallada-Test Antigen, there was 100% agreement in comparison with the classical VDRL microflocculation test. The new technique has the advantages that: 1) the antigen is stable; 2) it can be used with either serum or plasma; 3) the sample does not require heat inactivation; 4) reaction can be observed macroscopically. Additionally, the antigen is inexpensive. It is sensitive and allows single or multiple tests to be performed in a matter of a few minutes. As such, this technique is particularly adaptable for prescreening of donors for blood banks, for rapid screening in outpatient clinics, for use in small laboratories, and as an office test in the rapid diagnosis of suspected cases of syphilis.

JOHN E. STAUCH, PhD

WARREN W. KOPP, BS

Because of the increase in the infection rate of syphilis, interest has been renewed in methods for the early detection of such infections. Demonstration of the treponeme in a chancre by dark-field microscopy would afford enough evidence so that therapy could be initiated; but, unfortunately, too many patients ignore the presence of a "sore" or wait too long to seek medical attention, and the treponeme cannot be demonstrated. Diagnosis must then depend upon serologic means.

Classical serologic methods require precise technology. Either because of technical difficulties, as in the complement-fixation tests, or because of the instability of the antigens, as in the flocculation tests, most small laboratories do not perform serologic tests for syphilis. A test designed to meet the needs of the smaller laboratories or for use in office practice would be of value. Such a test should: 1) be performed with ease, 2) not require special tools or apparatus, 3) be inexpensive, 4) be designed so that single or multiple tests may be performed in minutes at any time, 5) employ a stable antigen, and 6) be as sensitive and specific as any of the classical antigens in use. The results of this study demonstrate that the proposed technique and antigen under study satisfies the established criteria.

Materials and Methods

The antigen used in this technique is made from a previously approved lot of cardiolipin-lecithin-cholesterol complex. These are prepared in accordance with the procedures developed by Pangborn et al.[1] The raw antigen solution was furnished by the Sylvana Company. Each lot is serologically standardized by comparison with a standard antigen of known reactivity. The unique feature of this antigen is that it is the VDRL antigen tagged to an inert carrier to allow macroscopic observation. Also, the antigen has been

From Laboratory Services, USAF Hospital Andrews, Andrews Air Force Base.

The Pallada-Test Antigen was supplied by the Bio-analytical Products Laboratory, Inc., Suitland, Md.

stabilized and made anticomplementary. Therefore, either plasma or sera may be employed in the test. These do not require heat inactivation, although samples previously heat inactivated can be tested. This antigen is stable for at least six months at refrigeration temperature and at least three months at room temperature. Each lot of the tagged antigen is serologically compared with standardized antigens and antisera.

The samples employed for the evaluation of the tagged antigen were obtained from: 1) random samples submitted for various chemical procedures, 2) prenatal samples submitted for serologic testing, 3) physical examination samples submitted for serologic testing, 4) samples submitted from suspect cases of syphilis, and 5) samples submitted by the Maryland State Health Department for serologic evaluation.

The tagged antigen was compared to the classical VDRL microflocculation procedure.[2] The sera found reactive to the tagged antigen or the VDRL microflocculation procedure, or both, were tested with the Reiter Protein Complement Fixation (RPCF) test[3] and by the Fluorescent Treponemal Antibody (FTA) test.[4]

The tagged antigen procedure was performed as recommended by the manufacturer. Either plasma or sera were obtained from venous blood or capillary blood (microhematocrit tubes, plain or heparinized). The clotted or whole blood samples were centrifuged gently to obtain clear plasma or sera. Using the Dispopette (Scientific Products), one drop of the patient's sample was placed either in the well of a Boener slide or of the slide furnished with the set. Positive control sera of known reactivity (Dade Reagents, Inc.), negative control sera, and weakly reactive control sera were similarly placed in the wells of a slide.

Samples collected in microhematocrit tubes were centrifuged in the microhematocrit centrifuge for one minute or were allowed to stand vertically in critoseal until the cells settled. The tubes were scratched at the interface of the plasma and cells. The tube was gently broken and a drop of the sample placed on the slide. The antigen was shaken to obtain an even dispersion of particles, and one drop was added to each of the test samples and the control samples. The contents of each well were mixed with an applicator stick, and the slide was rotated either on the mechanical rotator at 180 rpm for four minutes or by hand for four minutes. Both methods were equally satisfactory. When large numbers of tests were run, it was more convenient to use the mechanical rotator; when only a few were tested, rotation by hand was more convenient.

The results of the procedure were obtained by viewing the samples using soft oblique light through a blue filter of the microscope lamp. The positive controls and the reactive sera showed large clumps of the antigen-antibody complex. Negative reactors showed no clumping, and weak reactors were easily detected by comparison to the negative control. Reactive samples were titered by serial dilution of the sample in phosphate buffered saline diluent, and each dilution was tested as above.

Results

Accordingly, 10,279 samples of serum or plasma were tested by the tagged antigen and the classical VDRL microflocculation procedure. The results of the testing were classified as either negative or reactive. No attempts were made to grade the degree of reactivity except that all reactive samples were titered using the standard serial dilution method. Table 1 depicts the results of the two screening procedures and shows 100% correlation between the two methods.

Among the reactive samples, only those of clinical importance were titered. Table 2 reflects the results of this study. The end point was considered when the test reaction was just different from the negative control. It can be seen that 70 of the samples gave positive titers by the tagged antigen while 68 were positive by the VDRL microflocculation. The titers were slightly higher with the tagged antigen than with the VDRL microflocculation.

Three samples demonstrated a prozone reaction. They were considered weakly reactive by both the tagged antigen and the VDRL microflocculation, but upon titering the samples, one had a titer of 1:128 and two had titers of 1:64.

All reactive sera, in addition to titering, were tested with the RPCF test and the FTA test. Of the 110 samples so tested, only 63 were positive. The two treponemal tests were in 100% agreement and reflected that although both screening tests were in agreement, they were capable of elaborating false positive reactions. On further examination of the results, it was noted that all 63 positive by the RPCF test and FTA test were among those samples which had positive titers by

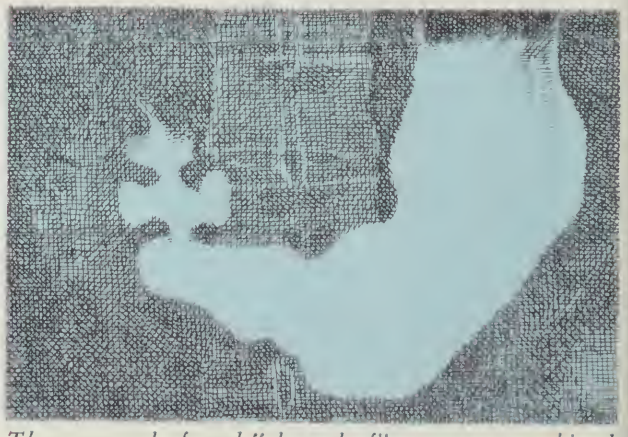
Loosening epithelial cells of nasal mucosa during early stage of cold—Approx. 1800× Magnification.

this issue: partners in misery

Partners in misery: common cold and duodenal ulcer*

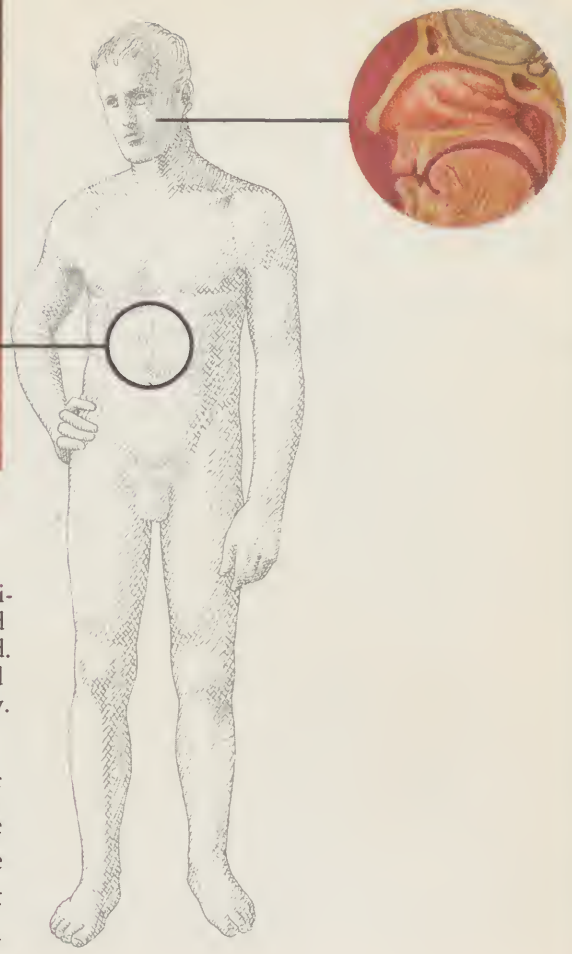
A century or two ago our forefathers believed that the common cold was caused by an excess of evil humors. Today we regard these baleful humors as a result of the cold rather than its cause. Only in the last ten years have some of the offending viruses been cultivated, and we now know many others can be transmitted to human volunteers although they cannot yet be grown in the laboratory. Various body defenses react to infection by a virus, and in the respiratory tract the lung is protected by the phagocytic properties of the pulmonary alveolar macrophage.[1]



Because of the brief history and large proportion of unidentified viruses, effective prophylactic vaccines have not yet appeared. A universal antiviral agent seems even more remote. Meanwhile, these viruses continue to produce epidemics of upper respiratory infection at seasonal intervals, particularly in spring, fall and winter, during which they propagate and distribute progeny indiscriminately. As a result, they are responsible for significant work loss. Since the immunity afforded is temporary, recurrent infections are common.

This recurrent morbidity in spring and fall is shared by duodenal ulcer, itself a cause of significant loss in wages and medical expense. Thirty years ago Emery and Monroe reported 1,279 recurrences of peptic ulcer of which 13 per cent could be attributed to upper respiratory infection, thus confirming a long-held clinical impression.[2] While the inflammation, congestion and secretion of the mucosa of the nasopharynx in the common cold, and the hyperemia and hypersecretion of the gastric mucosa during acute exacerbation of a duodenal ulcer may not be directly linked, it is probable that the miseries of the infection are reflected in the pain of the ulcer. The following case history illustrates this point.

Case report A 48 year old white male executive, suffering from hematemesis and melena for 12 hours was admitted to hospital on April 8, 1965. He gave a history of duodenal ulcer proved by x-ray studies 23 years previously. In the intervening years he suffered from typical epigastric pain occurring two hours postprandially, usually for two or three weeks each spring and fall. A hospital admission two years earlier had followed hematemesis of moderate amount.



The present admission was preceded by a recurrence of pain during a period of unusual business pressure. In addition he caught a cold one week before his entry to hospital and his already irregular eating habits were made more so by loss of taste and appetite, blocked nose and general malaise. During the final 36 hours he used aspirin to relieve his cold, taking 2 or 3 tablets with a glass of water on 6 or 7 occasions. Before retiring he drank a glass of hot toddy.

He awakened about 1 a.m. and vomited dark red blood and recently ingested food mixed with whisky. Melena followed and he was transferred to hospital. On admission he was pale, cold and sweating. Apart from epigastric tenderness and black stool on the examining finger after rectal examination, his general physical examination was not remarkable. Temperature was normal, pulse was thin and thready with a rate of 114 beats per minute, and blood

The commonly found "clover-leaf" roentgenographic abnormality of chronic duodenal ulcer due to spastic contractions and scarring.

Typical site of duodenal ulcer showing anatomical relationship to gastroduodenal artery and common bile duct.

pressure measurement was 104/60mm. of mercury. Hemoglobin estimation was 8.6 grams per cent, but white blood count, chest x-ray and urinalysis were within normal limits. No further bleeding occurred. After blood transfusions and a suitable medical regime he was dismissed two weeks later and advised to return later for consideration of surgery.

The care of the ulcer patient suffering from a viral infection of the upper respiratory tract is additionally handicapped by the local and constitutional symptoms so produced. Indifference to food often makes it difficult to "feed a cold" even in a patient without an ulcer. In the ulcer patient this becomes more than a homily, for malaise and apathy towards irksome routine produce a lack of interest in adhering to an ulcer program and result in its eventual failure if these symptoms are not relieved. The absence of curative treatment for these viral infections has spawned many a strange therapeutic offspring and some of the more generally accepted remedies contain a special risk for the ulcer patient.

To the gastric physiologist, the shot heard around the world was not fired at Concord but was discharged through the stomach of Alexis St. Martin. The worthy voyageur had a more than modest thirst and on several occasions William Beaumont observed through the resulting fistula the changes of gastritis which followed an immoderate ingestion of alcohol.[3] It is now well known that alcohol stimulates the production of gastric juice and the patient with an ulcer, even in remission, should not drink alcohol without first taking food, milk or antacid. The use of various alcoholic remedies for the common cold is to be strongly discouraged in this type of patient. Factors already present can produce an acute exacerbation of ulcer symptoms without the added stimulus of alcohol.

Headache and facial pain, sore throat and generalized aching are subjective discomforts of viral infections of the upper respiratory tract or their complications. Relief from them is usually sought in the family medicine cabinet, and of all the medications habitually stored there, salicylates are the most frequently used. Oral ingestion of salicylates has produced

I can taste, Doctor!

On Sippy diet or unrestricted regimen, food tastes better to the patient with a cold when you prescribe the oral decongestant

Triaminic® *tablets*

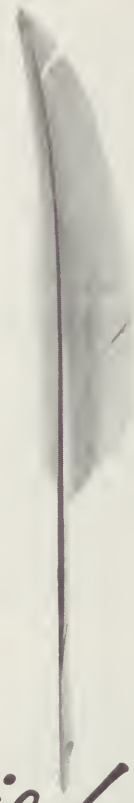
Each timed-release tablet contains:

Phenylpropanolamine hydrochloride	50 mg.
Pheniramine maleate	25 mg.
Pyrilamine maleate	25 mg.

One tablet on arising, in midafternoon and at bedtime assures round-the-clock relief. You may occasionally encounter these side effects: drowsiness, blurred vision, cardiac palpitations, flushing, dizziness, nervousness or gastrointestinal upsets. Precautions: the possibility of drowsiness should be considered by patients engaged in mechanical operations requiring alertness. Use with caution in patients with hypertension, heart disease, diabetes, or thyrotoxicosis.

(Advertisement)

substernal pyrosis and sometimes epigastric pain in susceptible individuals. Bleeding from erosions of the gastric mucosa has followed their use and has been severe enough in some instances to cause hematemesis and melena.[4] It has been suggested that interference with the protective mucous layer of the stomach allows this to happen. There is no evidence that hypersecretion occurs, but the taking of aspirin has been followed by exacerbation of ulcer symptoms and occasionally by gastrointestinal bleeding.[5] The ulcer patient with a cold should take salicylates with an antacid, or preferably other means of symptomatic relief should be found.



Caffeine has two actions on gastric secretion. One directly stimulates production of acid and the other potentiates the out-pouring of gastric juice as a response to other stimuli.[6] In high doses to animals, it has produced erosive gastritis and peptic ulceration. Caffeine-containing beverages are discouraged for the ulcer subject and forbidden during an acute exacerbation.[7] Many cold remedies contain caffeine.

To sufferers from allergic rhinitis springtime brings symptoms of nasal obstruction, loss of taste and smell and malaise similar to those caused by viral infection but due instead to allergens which at that time of year are principally tree pollens. Relief from these symptoms can be obtained, though not wisely, by the use of steroid medication. Unfortunately, chronic sufferers from these allergies have used this approach with varying degrees of success. Steroid hormones increase gastric secretion and delay the healing of experimental ulcers.[8,9] Clinically their administration has been associated with reactivation of healed duodenal ulcers, and with bleeding and perforation which were not always preceded by typical ulcer distress. Because of these harmful effects, their use in the ulcer patient is best avoided for other than serious medical problems and then only with adequate antacid coverage.

Summing up It is immaterial by which pathways the malaise and lassitude, depression and irritability activate an ulcer, but it is the physician's responsibility to ensure that the medications he selects to relieve the symptoms of a cold do not further aggravate the ulcer.

the tagged antigen and VDRL microflocculation test. Most of the false positive reactions occurred among the group of prenatal tests. False positive reactions were determined by two methods. The first was that the sera failed to show a rise in titer to the screening tests on subsequent testing or they became negative without the intervention with therapy, and they were negative to the treponemal antigens.

Discussion

The results of this study demonstrate that the new procedure makes an excellent screening test, but, like all other such tests which measure "reagin," a more specific test is required to elaborate true cases of syphilis. Several treponemal antigen tests can be employed, two of which were used in this study. In our experience, antibody to the treponemal antigens appears after the presence of reagin; hence early cases of syphilis may demonstrate reagin but not antibody to the treponeme. Therefore, clinical judgment along with the history is important in management of patients that reflect positive screening tests that have no titer and are negative to treponemal tests.

Although it is recommended that reactive sera be tested with treponemal antigens, few laboratories engage in the tests because of their complexity and the expensive equipment required. We investigated the possibility of using the protein extract of the Reiter strain of treponeme tagged to the carrier employed in the Pallada-Test Antigen. A simplified procedure has been devised for the demonstration of antibody to this treponemal antigen, but the evaluation of this procedure has not been completed.

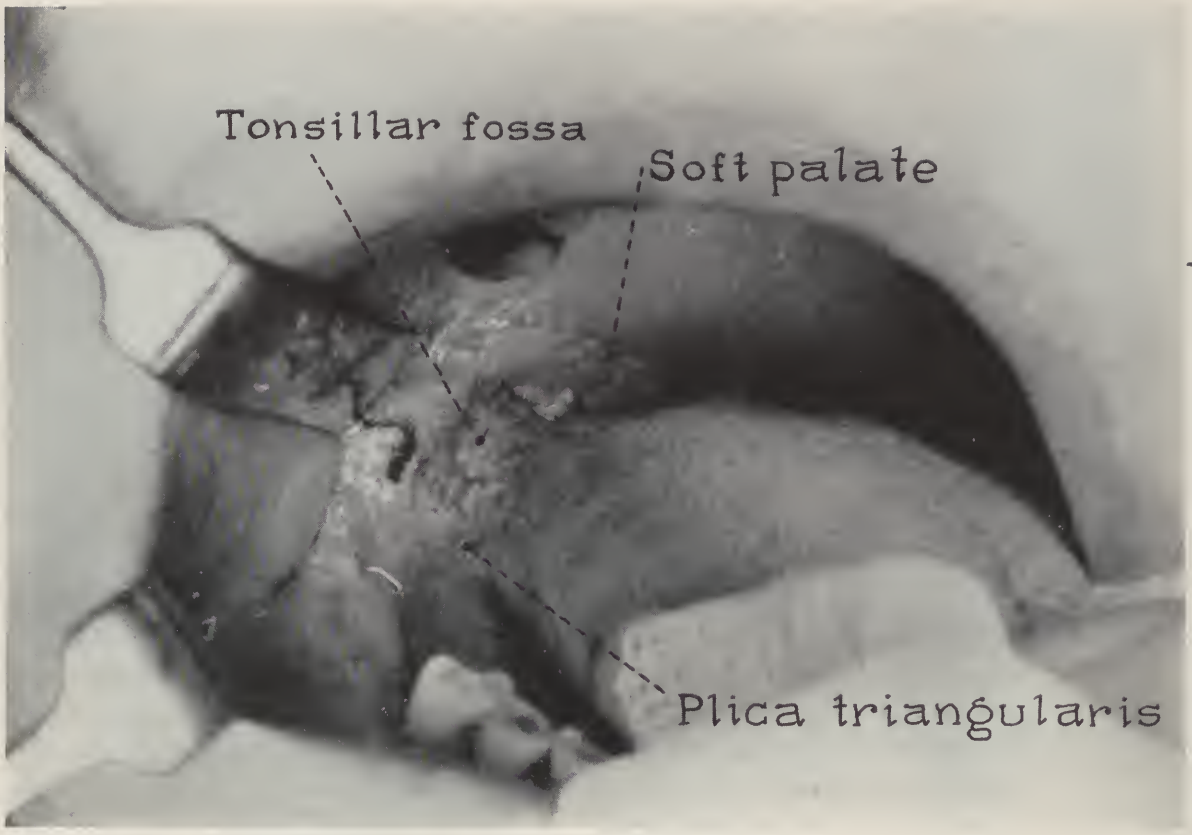
MALIGNANT TUMORS OF THE TONSIL

The clinical management of 66 cases of malignant tumors involving the lateral pharyngeal wall is described. The results of therapy correlated with the stage of disease and method of treatment are presented. In Stage I disease, irradiation or surgical excision resulted in an 80% three-year survival rate. Moderately advanced tumors were associated with a 25-30% three-year survival rate with either means of therapy. There were no survivors in patients with far advanced disease.

R. ROBINSON BAKER, MD
JOHN HOOPES, MD
JERRIE CHERRY, MD
STEWART LOTT, MD

This report is based on the clinical experience gained in the management of 66 cases of malignant tumors involving the pallatine tonsil or tonsillar fossa.[1] These tumors account for approximately 20% of malignancies arising in the oral cavity. The disease is relatively uncommon and frequently not recognized as a neoplasm in its early stages of development.



ANALYSIS OF CASES

Histology.—Ninety per cent of malignant tumors arising in this anatomical area were of squamous cell origin. The remaining tumors were various types of lymphomas including lymphoepithelioma, follicular lymphoblastoma, and lymphosarcoma. Seventy-two per cent of the patients with squamous cell carcinomas developed cervical lymph node metastases at some time during the course of the disease. This was probably the result of a combination of the biologic behavior of the tumor and the rich lymphatic network draining this anatomical area.

Clinical Material.—Carcinoma of the tonsil is encountered most commonly during the fifth decade of life, followed by the sixth and seventh decades. The ratio of male to female patients in this series was approximately three to one. Thirty per cent of the patients were chronic alcoholics, and more than half of the patients gave a history of heavy cigarette smoking. A sore throat or the detection of a mass in the neck were the most common presenting symptoms.

Early tumors can present as innocuous-appearing lesions, and a high index of suspicion is necessary for a correct diagnosis. The diagnosis should be considered whenever the tonsil is swollen or small whitish plaques are present over its

mucosal surface. The typical squamous cell carcinoma presents as an ulcerative lesion (Fig 1). In contrast, lymphomas characteristically present as a tonsillar mass without ulceration of the overlying mucosa. The neck should be examined for palpable nodes in all suspected cases of tonsillar carcinoma. Metastatic nodes usually present at the angle of the mandible along the course of the internal jugular vein.

Cytologic smears have proven to be a useful method of screening suspicious mucosal lesions. Biopsy is easily accomplished without significant morbidity. Bilateral tumors[3] occur in approximately 10% of the cases, and the contralateral tonsil or tonsillar fossa should be biopsied prior to definitive therapy.

A method of clinical staging has been proposed by the Joint Committee of the American College of Surgeons.[4] This system of staging describes the lesion by three parameters: 1) T—the anatomical extent of the primary tumor; 2) N—the presence or absence of cervical lymph nodes; and 3) M—the presence or absence of distant metastases. On the basis of this TNM classification, the cases are divided into four stages (Table 1).

TREATMENT

Operative treatment consisted of a radical neck dissection in continuity with a partial mandibulectomy and excision of the primary tumor. Reconstruction of the oral cavity was accomplished by a variety of techniques: 1) primary closure, 2) tantulum supported skin grafts, and 3) local tongue flaps.

Table 1

Clinical Staging according to the American Joint Committee's Proposed Method of Stage Classification[4]

quamous cell carcinoma arising in the right ton-llar fossa with extension to the soft palate and ica triangularis.

Those cases undergoing irradiation before 1960 were treated by orthovoltage x-ray utilizing 250 kv (HVL-2mm cu). Patients treated since then have received supravoltage x-ray therapy delivered by means of a 2 Mev. Van de Graaf generator (HVL-6.5mm Pb). Seven patients in this series received a planned course of preoperative x-ray therapy.

RESULTS OF THERAPY

Squamous Cell Carcinoma.—The results of the various types of therapy correlated with the stage of the disease are presented in Table 2. Stage I disease carries a relatively good prognosis. Results of Stage II and Stage III disease are essentially the same, regardless of treatment. There were no three-year survivors with Stage IV disease. In this series, the use of preoperative x-ray as an adjuvant to surgical excision did not increase the survival rate obtainable with either radiotherapy or surgery alone.

Lymphomas. — One patient with a follicular lymphoblastoma survived three years. The remaining patients with other types of lymphoma died with generalized disease within four to 21 months after initial therapy. All of these patients were treated by irradiation.

DISCUSSION

An analysis of this group of cases stresses the importance of early diagnosis. Tonsillar car-

B. Postoperative result following construction of the forehead flap. The resulting defect has been covered by a split thickness skin graft.

cinoma can be cured if diagnosed early in the course of the disease. A distressing number of patients in this series were treated for inflammatory conditions, thus delaying diagnosis and appropriate therapy.

Surgical excision or radiotherapy appear to be equally effective in the management of tonsillar carcinoma. However, radical surgical excision of the tonsillar area was associated with an operative mortality of 13% in this series. Two of these deaths occurred from hemorrhage in the immediate post-operative period. The remaining two patients developed oral cutaneous fistulae which resulted in exposure of the carotid artery. Death occurred from hemorrhage secondary to infection and subsequent necrosis of the arterial wall. Although these deaths occurred within the early years of this study, hemorrhage will always remain as a potential cause of death in any operative procedure. The deaths from oral cutaneous fistulae can be prevented by improved methods of closure. Within the past several years, an improved technique of reconstruction has been developed which utilizes a large forehead flap based on the ipsilateral superficial temporal artery[2] (Fig 2). This type of repair provides an excellent means of covering large mucosal defects, but it does not replace the intricate musculature which is necessary for normal swallowing.

There was no significant difference in the immediate morbidity associated with surgical excision or irradiation. Dysphagia was a significant long-term complication in those cases treated by radical surgical excision. This was attributed to resection of the musculature of the lateral pharyngeal wall.

On the basis of this relatively small number of cases, it is difficult to establish the optimal means of cure or effective palliation. The recent advances in surgical technique may lessen the operative mortality and morbidity. In an effort to answer these questions, we are initiating a controlled study. In a random series of patients, the effectiveness of irradiation of the primary tumor fol-

B

lowed by a radical neck dissection will be compared to the operative procedure which removes the primary tumor in continuity with a radical neck dissection.

The therapy of patients with tonsillar carcinoma usually does not end with the initial treatment to the primary tumor and the cervical metastasis. A constant number of recurrences are encountered which present an even greater challenge in management. The treatment of recurrent disease in this series of patients has also been analyzed. Surgical excision offers the best chance of salvage following recurrence of lesions initially treated by radiotherapy. The results do not appear to be affected by the time interval between initial therapy and detection of the recurrence. Recurrent disease following an operative procedure has been controlled for significant periods of time by either radiotherapy or simple local excision. The time interval between the operative procedure and the detection of recurrence in this group of patients seems to be important. Those patients developing a recurrence within 12 months of the operative procedure did not benefit from additional therapy of any kind.

Sustained circulatory, respirator and cerebral stimulation for th

(fewer absent doses by absent-minded patients)

Human volunteer subjects were administered Geroniazol TT tablets with the nicotinic acid component made radioactive with C-14. Plasma and urine samples were analyzed. (See Figures I and II) The radioactive tracer study substantiated the previous clinical evidence that the release of nicotinic acid from the Geroniazol TT tablet produced a gradual rise in plasma levels to a plateau for a total of 12 hours and more.

Such proven sustained activity makes the management of geriatric patients much easier by minimizing the possibility of neglected doses through absent-mindedness or senile confusion. Therapy *can* be continuous on a daily dose of only one Geroniazol TT tablet every 12 hours.

The gradual release of nicotinic acid in Geroniazol TT will provide the well-known peripheral vasodilatation needed in patients with deficient circulation and with a minimum amount (if any) of "flushing." Also, cerebrovascular circulation is complemented by pentylenetetrazol, long-established as a cerebral and respiratory stimulant.

Geroniazol TT improves the typical, unfortunate, signs of senile confusion. Patients become more alert,

ged and debilitated

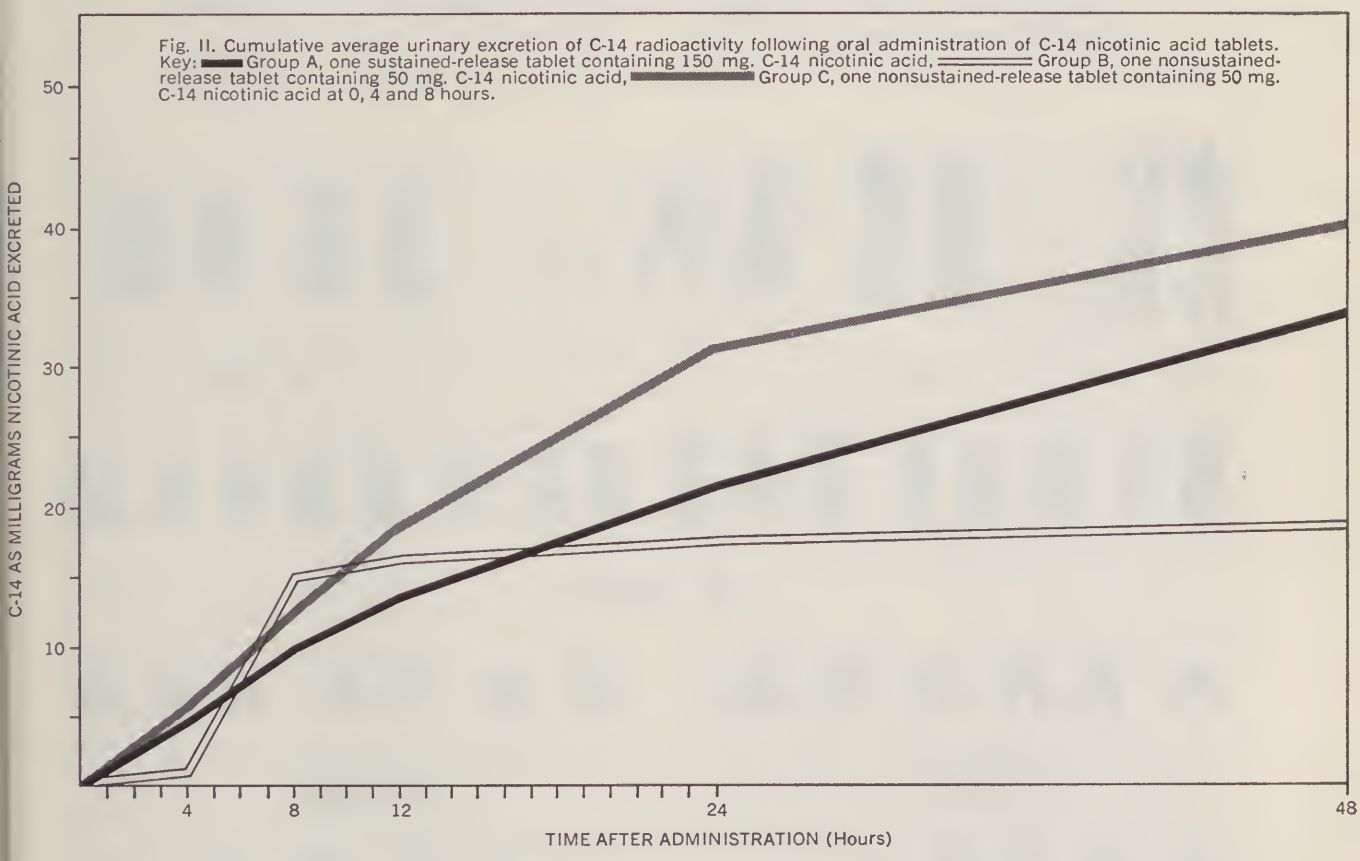

Fig. II. Cumulative average urinary excretion of C-14 radioactivity following oral administration of C-14 nicotinic acid tablets. Key: ▬ Group A, one sustained-release tablet containing 150 mg. C-14 nicotinic acid, ═══ Group B, one nonsustained-release tablet containing 50 mg. C-14 nicotinic acid, ▬▬ Group C, one nonsustained-release tablet containing 50 mg. C-14 nicotinic acid at 0, 4 and 8 hours.

less confused and moody. Personal care, memory, emotional stability, social attention improve. Fatigue, apathy and irritability are reduced.

A prescription for 100 tablets of Geroniazol TT will permit your patients to enjoy the benefits of time-prolonged nicotinic acid/pentylenetetrazol therapy, at an economical price. Dosage is only one tablet every 12 hours.

Contraindications: There are no known contraindications.

Precautions: Exercise caution when treating patients with a low convulsive threshold.

Side Effects: Side effects are rarely encountered, however due to the vasodilatation effect of nicotinic acid, transitory mild nausea, flushing, tingling and pruritus are possible.

Dosage: One tablet every 12 hours.

Supplied: Prescribe bottles of 100 tablets, to take advantage of recent price reduction.

A case of trisomy 17-18 and a review of the literature is presented. This chromosomal anomaly is associated with an exceedingly large number of congenital defects. Low-set malformed ears, receding chins, flexed fingers, and intraventricular septal defects are the only relatively common abnormalities. None of these is specific for the syndrome. Female births predominate. There is a strong tendency to post-term delivery. Advanced maternal age seems to be the only apparent causative factor. The inconsistency of the clinical findings makes chromosomal analysis mandatory. The prognosis is poor.

Karyogram

TRISOMY 17-18

The Clinical Scope of a Chromosomal Aberration

HANS-DIETER TAUBERT, MD
ERICA F. MOSZKOWSKI, MD
OAKLEY H. SAUNDERS, MD

The human chromosomal complement had been definitely established as 46 in 1956.[34,58] It was soon recognized that certain numerical and structural deviations from the normal state need not necessarily be lethal. Several congenital syndromes of varying degrees of severity have consistently been found in association with such aberrations.

The concurrence of abnormal karyotypes with relatively well defined clinical entities as Down's, Turner's, and Klinefelter's syndrome and the trisomies involving the chromosomes 13-15 and 17-18 raised some hope that chromosomal aberrations would serve as denominator for accurate classification of the wide range of congenital defects observed.[5,35,44,45,50] As more cases were reported it became apparent that each chromosomal anomaly could be associated with a surprisingly large number of congenital defects. Only few would be found frequently enough to consider them as pathognomonic. Many seem to be common to all autosomal abnormalities. Healthy individuals with obviously abnormal karyograms have been observed.[38,56,60] Conversely, normal chromosomal analyses have been obtained from patients who were believed to exhibit the typical features of a given syndrome.[3,46,48]

The frequent lack of correlation between morphologic defects and cytologic data points out the necessity of reporting further case material. This might contribute to mapping chromosomes as to areas where they cause defects[22] and to elucidating possible etiologic and epidemiologic factors. We had the opportunity to study a newborn with the features of trisomy 17-18. This case stimulated a review of the literature, which will be presented.

Case Report

The patient, a Negro girl, was born on September 2, 1963. The pregnancy and delivery had been uneventful. No placental abnormality was noted. The gestational age was 45 weeks according to the last menstrual period.

The mother was 44 years old, and the father was 54. There were eight previous children, of which one was stillborn at 32 weeks of gestation.

There was no evidence of consanguinity or congenital malformations in the family. Neither parent had been exposed to irradiation or febrile illness around the time of conception. The mother's hematogram was normal. Several unusual features presented at birth. The infant weighed 2125 gm. The suboccipito-bregmatic circumference measured 33cm; the thorax, 28cm; and the crown-to-heel length was 47.5cm. The cry was good. Muscle tone was poor. The ears were small and pointed. The uppermost portion of the helix was at a level with the outer canthus of the eyes. The eyes were normal, including fundoscopic examination. The occiput was of questionable prominence. A harsh, pansystolic murmur grade iii/iv was best heard in the third intercostal space right of the parasternal line. The lateral aspects of the extremities showed hypertrichosis and lichenification. The flexion crease of both digiti minimi was absent. There was some degree of gull-wing deformity of the left hand. Both feet showed "rocker-bottom" formation.

Laboratory data: Hematologic and chemical blood analyses were normal. Chest x-ray showed general enlargement of the heart, more marked on the left. Electrocardiogram revealed sinus tachycardia and right axis deviation. On the basis of the presenting anomalies, the clinical diagnosis of trisomy 17-18 was entertained. Barr bodies were seen in 43% of the cells obtained by buccal smear.

Leukocytes were cultured by modification of the technique of Moorhead et al.[47] Sixty-two cells in metaphase were used for analysis. The chromosome count in all but two was 47 (Table 1). Karyograms were constructed from 17 metaphase preparations with 47 chromosomes and from both cells with 46 chromosomes. In the former group an extra autosome with submedian centromere similar to the chromosomes 17-18[32] or group E[51]

Table 1

Number of Chromosomes	45	46	47	48
Number of Cells	0	2	60	0

From the Department of Obstetrics and Gynecology, University of Maryland School of Medicine; and the Department of Pediatrics, Provident Hospital, Baltimore.

was found. These supernumerary chromosomes were not present in the two cells with normal chromosomal number of 46 (Fig).

Chromosome counts of less than 46 were not encountered. No attempt was made to attach numbers to the chromosomes 6-12 (C) and 13-15 (D). The X-chromosome was included into group 6-12. The trisomic autosome was labelled as 17-18.

Clinical Course: The infant remained sluggish and inactive. She fed and gained weight poorly. She was discharged at four weeks of age. She was readmitted to the hospital on January 26, 1964, dehydrated and in cardiac failure. She died the next morning at 19 weeks.

Postmortem examination: The body of this undernourished and dehydrated Negro infant weighed 2150gm and measured 53cm in length. There was almost complete loss of subcutaneous fat tissue. The external genitalia had normal female appearance. The fourth and fifth finger showed fixation of the interphalangeal joints between the proximal and second phalangeal bone. The plantar arches were bilaterally flattened.

The foramen ovale was closed. Both ventricular walls were hypertrophied. A large interventricular defect of 0.7cm was present. There was no coarctation of the aorta. All cardiac valves were of normal configuration. The lungs showed many circumscribed dark reddish areas. The thymus weighed 2gm; the cut surface showed a marked increase of fibrous tissue between yellowish lobules.

Microscopic examination: Many pulmonary alveoli contained neutrophilic leukocytes and macrophages with vacuolated cytoplasm; others contained red blood cells. The alveolar epithelium was hyperplastic. Edema and interstitial pneumonitis were present.

Sections of the liver revealed acute congestion. Examination of the salivary glands failed to show intracytoplasmatic or intranuclear inclusion bodies. There was atrophy of the adrenals with lipid depletion. The convoluted tubules of the kidneys showed cloudy swelling. The cortex of the thymus contained a smaller number of thymocytes than normal.

Review of the literature

During a review of the literature up to the end of 1963 we encountered 30 communications containing data on 55 cases.[1-30]

The significant symptoms, anomalies, and observations were tabulated and listed with reference to the respective authors.* It soon became apparent that the enormous diversity of findings stood in sharp contrast to the relative paucity of defects which one could consider specific for this syndrome.

Affected infants are usually born with peculiarly malformed, low-set ears, often with skin-tags. They have markedly receding chins. The fingers are flexed and overlapping. The big toes are short and dorsiflexed. Intraventricular septal defects are the most common serious anomaly. These infants feed poorly, and have a poor cry and weak Moro reflex. They are mentally retarded, fail to thrive, and succumb early to cardiac decompensation and respiratory distress. The congenital malformations and findings which occur in more than 40% of the cases and are helpful in establishing the clinical impression of trisomy 17-18 are summarized in Table 2. The remaining anomalies were found less frequently, nearly half of them in singular instances.

Table 2

Most Common Findings

Low set ears, malformed	94%
Micrognathia	89%
Failure to thrive	82%
Flexed, overriding fingers	82%
Mental retardation	71%
Interventricular, septal defect	62%
Dorsiflexed big toes	58%
Spasticity	55%
Prominent occiput	42%
Poor sucking reflex	41%
Limited hip abduction	41%

Development: The physical retardation of these infants is shown by their small average birthweight and crown-to-heel length. The mean birth weight of 2,381gm is lower than Potter's value of 2,998.8gm, and the length of 44.2cm less than the average of 50.2cm for 10-month gestational age.

Survival: In contrast with abnormalities of the sex-chromosomes or Down's Syndrome, the chances for survival of children with trisomy 17-

*This tabulation will be furnished by Dr. Taubert upon request.

Table 3
MATERNAL AGE DISTRIBUTION

Age	Trisomy 17-18	General Population*	Mothers with Malformed Offspring**
14-19	1.9%	24.8%	21.9%
20-24	25.0%	29.1%	27.1%
25-29	9.6%	22.3%	20.3%
30-34	13.5%	14.1%	18.0%
35-39	21.1%	7.5%	9.3%
40-over	28.9%	2.2%	3.4%
	100.0%	100.0%	100.0%

* Based on 28,970 deliveries (1955-1963), University of Maryland.
** Based on 571 deliveries of malformed infants (1955-1963), University of Maryland.

18 are dismal. One may assume that only the more mildly affected cases result in full term gestation. Carr[31] considered two out of 12 abortuses with chromosomal abnormalities to be trisomic for No. 17-18.

At the time of reporting, only six of a total of 56 cases were alive. One of them had reached teenage, but this particular patient was only partially trisomic.[30]

The survival time was specified in 44 cases. It ranged from 36 minutes to 820 days. The mean survival time was 120 days. Only 47.8% of the infants lived longer than 100 days.

Cause of death: The cause of death was listed for 33 cases. Respiratory distress or pneumonia were most common, accounting for 54% of deaths. Other contributing factors were cardiac failure (42%), failure to thrive (9%), urinary tract infection (6%), and hepatitis (3%).

Causative factors: Since this syndrome had apparently not been recognized before Edwards[5] described it in 1960, extraneous or environmental causes similar to the thalidomide disaster have been suspected. The available data do not confirm this hypothesis.

Irradiation: Three mothers had been exposed to diagnostic doses of x-rays shortly after conception. Irradiation of the father could be established in two other cases.

Illness: One mother reportedly had a viral infection at the time of conception. Another one was hyperthyroid. No drugs were incriminated.

Heredity: Consanguinity was found once in a Mennonite family.[27] Siblings were found affected with trisomy 17-18 in three instances.[13,15,30]

There were nine cases of other malformations in close relatives. Chromosomal analyses of the parents of affected children proved to be normal in almost all cases. One carrier-state was uncovered. This particular mother had one chromosome 17-18 translocated onto one of the chromosomes 13-15.[2] The infant was partially trisomic with a translocation identical to the mother's.

Maternal age: Advanced maternal age was common in the 52 cases where this information had been given. The age at delivery ranged from 17 to 44 years. The average age was 32 years. Almost one-third of the mothers were older than 40, and 50% were older than 35. Table 3 shows the maternal age distribution of mothers of trisomic children in comparison with a series of women with malformed children and a general population.

Paternal age: Comparable data are not available in regard to paternal age. The range was from 22 to 54 years, with a mean age of 34. Paternal age seems to be a contributing factor in other trisomic states only in conjunction with translocations.

Duration of gestation: The difficulty of establishing the diagnosis of a post-mature gestation is too well known to be elaborated upon in this context. This problem is compounded in a series as presented here, which was derived from multiple sources. It seems nevertheless remarkable that 41.9% of the pregnancies were believed to have lasted longer than 40 weeks. In our clinic this would be considered a five-fold increase.[41] The number of infants born after 40 weeks of gestation increases with advancing age of the mother. Sixty per cent of the women aged 35 years and

more delivered after the expected date of confinement compared with 28.5% of younger women.

Delivery after term appears to be related to more severe affection. These children survived an average of 72 days, while those born at 40 weeks lived an average of 256 days.

Sex ratio: There were 37 girls and 18 boys and one whose sex was not specified. The resulting male: female ratio of 1:2.055 is more than twice the average ratio of 1:0.989 in our material. This is in full accord with previous reports.

This discrepancy is believed to be due to more severe affection of males. Such pregnancies supposedly terminate more often in abortions.[57] The relative lack of genetic material on the Y-chromosome, compared with the X-chromosome, is a possible factor.[37] Nevertheless, once development proceeds through the third trimester of pregnancy, both sexes seem equally severely afflicted. The survival times of male and female infants do not differ (males, 119 days; females, 121 days).

Race: All but three of the 56 infants were of caucasian extraction. Our patient was the second Negro child found to be trisomic for No. 17-18. Another infant was Chinese.[8, 27]

Laboratory data: Blood chemical and hematologic data were not pertinent and were not included in our tabulations. Specific roentgenologic findings were recently discussed by Moseley.[16]

Dermatoglyphics: Examination of the dermal ridge pattern is apparently more specific for establishing the diagnosis than any of the listed congenital defects. Only one-fifth of the cases were studied in this aspect. The most prevalent finding was the high number of digits with simple arches, absence of the distal flexion crease on most fingers, digital loops between III and IV, and wide, open fields on the soles.[10, 12, 52, 59, 60]

Cytologic examination: In a number of reports, as in ours, the diagnosis was suspected on clinical grounds. Since the morphologic findings lack specificity, the diagnosis will have to be verified by chromosomal analysis for the foreseeable future.

Cytologic data were related in 51 cases. In 41, a chromosome of group 16-18 (E) existed in triplicate. Two authors followed Edwards[5] and labelled the extra chromosome as No. 17.[4, 23] Several others remained undecided between No. 17 and 18.[9, 14, 16, 24, 25] The balance expressed preference for the autosome in position 18.

Double trisomies were observed thrice. The X-chromosome was triplicated in two instances, and No. 21 once in addition to trisomy 17-18. Five examples of partial trisomies or translocations were related. In two of them the triploid chromosome 17-18 was affixed to an accrocentric autosome of group 13-15.[2, 10] In another case the translocation affected chromosome No. 4.[7] The remaining cases were not detailed.

The possible gamut of abnormal karyotypes associated with this syndrome is complemented by one patient who had the expected defects but a normal number of autosomes.[3] In another case two stemlines of cells were found. One showed the trisomic chromosome; the other one was normal.[15]

Not included in the tables was a child reported by Ferguson et al[34] with similar defects and 47 chromosomes. The extra chromosome resembled No. 22 but was believed to be an incomplete chromosome No. 18.

Incidence: Since the first report of this syndrome, a large number of cases have been diagnosed. Several authors, especially Uchida and Smith, saw surprisingly many examples of this entity.[20, 21, 26, 27, 40, 57]

Unless a definite cause for this sudden surge can be found, it is safer to assume that such cases were formerly reported under various eponyms. There are striking similarities to the Pierre-Robin syndrome, which is characterized by micrognathia and glossoptosis.[55] One of Koenig's cases of this syndrome was subsequently found to be trisomic for chromosome 17-18.[14] We saw such a case in 1957, which in retrospect appears compatible with a trisomy.

Pfeiffer et al described a case of trisomy 17-18 appearing clinically as arthrogryposis multiplex congenita.[17] Gaylor and Fried, however, could not confirm this finding in their case material.[39]

Frequent features of trisomy 17-18, such as low-set ears, micrognathia, and hypertelorism, are considered typical findings in Potter's syndrome of renal agenesis.

It is difficult to quote even the approximate frequency of this aneuploidy. Smith found three cases in 10,345 consecutive deliveries. This represents an approximate incidence of 1:3500 deliveries.

We reviewed 28,970 deliveries over the past eight years for combinations of congenital malformations suggestive of trisomy 17-18. There were 571 malformed infants (1.9%), none of which presented with suggestive lesions.

Prenatal factors: Sparse data are available concerning gestational history. The suggestion has been made that such pregnancies follow sterility. This does not seem to be factual. The average number of pregnancies per woman was 3.65; the number of term deliveries, 3.15. Only three of these women were nulliparous, and two of these were young. Nine had had many pregnancies.

Decreased intrauterine activity during the last weeks before delivery was noted in the few reports where these parameters had been considered. In such event polyhydramnios, single umbilical arteries, and rather small placentae were commonly found.[6, 8, 12, 21, 22, 27, 28]

Comment

Failure of the homologous chromosomes to separate during the first meiotic division will result in one gamete with 24 chromosomes and one with 22. The former would produce at fertilization a zygote with 47 chromosomes. In the latter case a non-viable zygote with 43 autosomes would result. Non-disjunction can also occur at the second maturation division. If there is only little crossing-over at this stage, the resulting chromosomes would bear almost identical genetic information. Relatively mild cases of trisomic states could thus be explained.[14]

The occurrence of mosaic autosomal trisomies suggests the possibility that postzygotic mitotic divisions might be non-disjunctional. Mosaics are difficult to exclude even if more than one tissue has been examined. The relation between the two stemlines might be altered according to the ability of the aneuploid cells to reproduce.[57]

The nomenclature of this and other chromosomal anomalies has been confused. Edwards[33] suggested recently to denote the various syndromes according to Patau's classification rather than the Denver system, with a suffix indicating the sequence of their respective recognition. Trisomy 17-18 would thus become Trisomy E_1. This system is plausible but does not allow for immediate recognition of the chromosome implicated.

The presented material confirms that advanced maternal age is the only obvious etiologic factor.[50] The same has been observed in other congenital anomalies. The incidence of women past their 35th year in our material approximates the percentages reported for Down's syndrome (58%) and Trisomy D_1 (40%) and is considerably higher than the average (9.9% at University of Maryland, 11.8% University of Wisconsin).[57]

Iffy suggested that postmidcycle ovulation is responsible for most fetal monstrosities. Delayed ovulation produced malformed progeny and chromosomal abnormalities in amphibians. Advanced age per se was no factor.[62] It has been postulated that the ova of older women are deficient in their cytoplasm. This will express itself during the meiotic and first postzygotic divisions, when the ovum and zygote respectively still depend environmentally upon the cytoplasm derived from the gamete.[49, 53]

The malformations are mostly due to arrested development between the eighth and twelfth weeks of fetal life.

The anlage for the external ear is below the region of the mandibula. Defects of these are always associated, usually in conjunction with a small oral cavity.[16] This defect of the first branchial arch and the interventricular septal defect appear to be the most specific combination of useful diagnostic criteria for trisomy 17-18. However, no anomaly so far has been shown to be specific for a trisomic state.[57] Every anomaly presents at least one gene locus in the normal development of the afflicted organ, so trisomy might be a means of establishing autosomal linkage groups in man.[50] For this reason complete reporting of the defects observed is highly desirable.

The severity of this syndrome does not make it amenable to therapy.

Confirmation of the diagnosis by chromosomal studies not only is of academic interest but is important for counseling parents concerning the prognosis of the particular child and the possibilities of it occurring again in future offspring.

ACKNOWLEDGEMENT: Richard J. Roh provided technical assistance; Hsiang Len Tseng, MD, provided pathologic data; Mrs. Phyllis Cooper provided statistical material.

direct musculotropic action
with.....

Trocinate®
BRAND THIPHENAMIL HCl

Available in 100 milligram pink sugar-coated tablets.

The high therapeutic index permits dosage sufficient to relieve spasm promptly. The usual initial dose is 4 tablets. Maintenance dosage is usually one or two tablets 4 times a day.

Trocinate *BRAND* THIPHENAMIL HCl
BETA-DIETHYLAMINOETHYL DIPHENYLTHIOACETATE HYDROCHLORIDE

Directly relaxes smooth muscle spasm
Combats hypermotility
Non-mydriatic, may be used in glaucoma

Trocinate (Thiphenamil HCl) has been found in three clinical studies, (J. Mo. Med. Assoc., 48:685-6; Med. Rec. & Annals, 43:1104-6; J. Urol., 73:487-93), to be effective and to be virtually free of side-effects. Fifteen years of wide clinical usage has affirmed the safety and effectiveness of Trocinate.

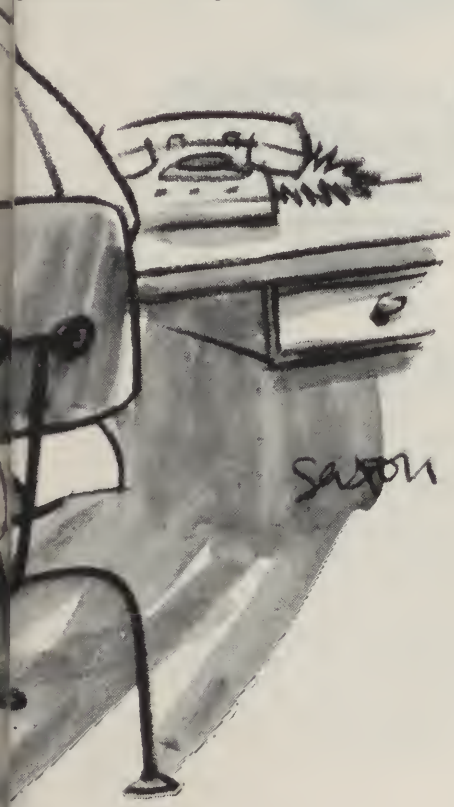
Well, Doctor, it's sort of
a cross between a smoker's hack and a seal's bark.



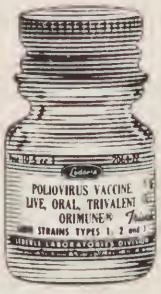
t's a wise mother who realizes there may be more to her child's cough than meets the ear —and brings the youngster to you promptly for diagnosis and treatment.

f the cough is the useless, exhausting type that often accompanies respiratory infection or allergy, you can provide prompt relief with Novahistine DH. Its decongestant-antitussive action controls frequency and intensity of cough spasms without abolishing cough reflex. And the fresh grape flavor of Novahistine DH appeals to children and adults alike.

When your diagnosis is bronchitis, complicated by thick tenacious exudates, Novahistine Expectorant is particularly useful. It not only provides decongestive action and controls the cough, but also encourages expectoration, thus easing bronchial constriction and obstruction.

Use with caution in patients with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Ambulatory patients should be advised that drowsiness may result. Continuous dosage over an extended period is contraindicated since codeine phosphate may cause addiction.

Each 5 ml. teaspoonful of Novahistine DH contains codeine phosphate, 10 mg. (Warning: may be habit forming); phenylephrine hydrochloride, 10 mg.; chlorpheniramine maleate, 2 mg.; chloroform (approx.), 13.5 mg.; l-menthol, 1 mg. (Alcohol 5%). Each 5 ml. of Novahistine Expectorant contains the above ingredients and, in addition, glyceryl guaiacolate, 100 mg.

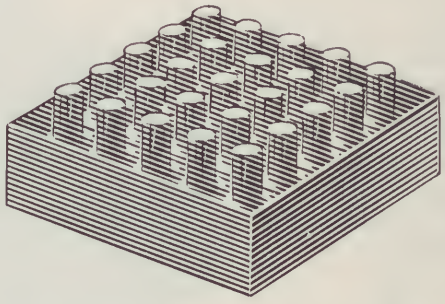


NOVAHISTINE® DH
NOVAHISTINE® EXPECTORANT

Dow PITMAN-MOORE

Division of The Dow Chemical Company, Indianapolis

Doctor...two important Lederle products for routine office procedures



single-dose vials for convenient and economical polio immunization

ORIMUNE®
POLIOVIRUS VACCINE, LIVE, ORAL
TRIVALENT
SABIN STRAINS, TYPES 1, 2 and 3

Fast, simple administration—and economy for the patient—make the new 0.5 cc single-dose vial of ORIMUNE Trivalent ideal for private practice. (Packaged 5 to a box with 5 sterilized disposable droppers for your convenience).
(Also available in 2 cc and 2 drop dosage forms).
Only 2 doses required for complete, initial immunization for patients more than a year old.

Effectiveness—may be expected to confer active immunity against all three types of poliovirus infection in at least ninety percent of susceptibles only if given at full dosage, as directed. No characteristic side effects have been reported. There are, however, certain contraindications. These are, broadly: acute illness, conditions which may adversely affect immune response, and advanced debilitated states. In these, vaccination should be postponed until after recovery.
In infants vaccination should not be commenced before the sixth week of life. Do not give to patients with viral disease, or if there is persistent diarrhea or vomiting. ORIMUNE and live virus measles vaccine should be given separately.
Dosage—initial immunization: two doses each given orally at least 8 weeks apart. (Give a third dose to infants at 10-12 months). Booster immunization: one dose, given orally. See package literature for full directions.

simplifies routine screening

TUBERCULIN, TINE TEST
(Rosenthal) Lederle

Swab · Uncap · Press · Discard

Comparable in accuracy and reliability to older standard intradermal tests*, but faster and easier to use. Since TINE TEST is relatively painless it should receive greater patient acceptance. Results are read at 48-72 hours. The self-contained, completely disposable unit requires no refrigeration and is stable for two years.
Side effects are possible but rare: vesiculation, ulceration or necrosis at test site. Contraindications, none; but use with caution in active tuberculosis. Available in boxes of 5 (new individually-capped unit); cartons of 25.

Psychological factors play a prominent role in patients' reactions to even the most potent chemotherapeutic agents. Psychological factors include:

- **The patient's attitudes, hopes, expectations, and fears**
- **The patient's conception of the nature of his illness, and hence his conception of the appropriate remedies**
- **The patient's past experiences with drugs and with doctors**
- **The symbolic meaning of the drug to the patient**
- **The interaction between the drug's pharmacologic effect and the personality structure and defensive system of the patient**
- **Psychological factors in the doctor which influence the context in which he prescribes drugs and the manner in which he does so**
- **The interpersonal relationship between patient and doctor in which communications occur simultaneously on many levels.**

The degree of success to be attained in chemotherapy will be influenced by the physician's attention to these factors.

PSYCHOLOGICAL FACTORS IN DRUG ADMINISTRATION

GERALD D. KLEE, MD
Associate Professor of Psychiatry
The University of Maryland School of Medicine

From ancient times the practice of medicine has been associated with the administration of drugs. We now recognize that throughout most of medical history the majority of drugs in use were pharmacologically useless or even harmful; hence whatever success physicians achieved can be ascribed largely to nonpharmacologic factors. In the present era, pharmacology has become a highly sophisticated science, and chemotherapy continues to make great strides. It is now over a decade since psychopharmacology has appeared as a unique branch of chemotherapy. This new arrival has already established a firm and growing role in the treatment of minor and major emotional disorders.

Despite the undisputed successes of pharmacology, most experienced physicians would agree that the doctor himself is the most potent therapeutic agent and that the doctor-patient relationship has a powerful influence, for good or ill, on the effectiveness of any type of chemotherapy. I shall discuss some of the most significant psychological factors which are involved in chemotherapy. Although I will refer chiefly to the use of psychotropic medications, most of the principles apply to all forms of chemotherapy.

When a patient seeks the help of a physician, he hopes and expects relief of his suffering. The patient usually has a past history with his symptoms and quite possibly with other forms of treatment, either with the present doctor or with others. He also may have his own theories about what is really wrong with him. Quite often he has fairly definite ideas about what he wants the doctor to do. Everyone has seen the kind of patient who simply won't be happy until he gets a shot of penicillin for his cold and will not rest until he finds the doctor who will give it to him.

Patients with anxiety, depression, or other symptoms related to emotional disturbances may be determined that the doctor shall find organic causes for their symptoms and that he shall pre-

Adapted from a presentation on this subject in the Postgraduate Course in Psychiatry for the American College of Physicians, June, 1964.

scribe a somatic form of treatment, such as chemotherapy, for them. Moreover the patient may present his symptoms in a manner designed to elicit the desired response. The physician may be faced with the dilemma of either losing the patient or prescribing a useless or harmful form of treatment which will only reinforce the patient's erroneous beliefs about his illness. In these cases, however difficult it may be, it is usually desirable to make the effort to relieve the patient of some of his misunderstanding about the nature of his problems, whether or not chemotherapy later proves to be indicated.

Many patients have difficulty in thinking of illness in other than concrete terms and may come for treatment imbued with ideas of the magic of modern medicine. The patient may expect, or at least hope, that the doctor will be able to provide him with some miraculous cure which will relieve him of all his troubles with little or no effort on his part.

The prototype for this type of relationship is the patient suffering from an acute abdomen who sees a surgeon. The doctor makes the diagnosis; the patient is put to sleep with a general anesthetic, and with practically no participation on his part other than passive cooperation, he is relieved of his inflamed appendix.

The emotionally disturbed patient may be disappointed and angry to discover that the doctor has no miracles for him, and the doctor himself runs the risk of feeling inadequate in being unable to satisfy the patient's unrealistic expectations. Many therapeutic errors are the result of the physician's efforts to avoid recognition of his own feelings of impotence.

Administration of a drug is a concrete act which may have a wide variety of meanings for the patient, and these meanings may have profound influence on his reactions to the drug. For some patients, when the doctor gives drugs it means that the doctor really cares and really wants to help. It may mean to the patient that at last he has found someone who will, in a sense, give him the love that he has been unable to receive elsewhere. A young woman who was in psychotherapy for a mixed psychoneurosis and many interpersonal problems made numerous requests over a period of time that she be given medication. In the course of her treatment she ultimately developed symptoms for which a tranquilizer was indicated. A new experimental drug in which her psychiatrist was interested at the time was administered. On her next visit she reported a dream which she had had on the first night after receiving the medication. In her dream, her psychiatrist was holding a big party in his office. He had huge bags of candy and cookies and invited her to take all she could eat. Needless to say, she had immediate relief from many of her symptoms, including a rather severe anorexia. This same drug was later removed from production by the pharmaceutical house which prepared it because it was found to be generally ineffective.

For other patients, when the doctor gives drugs for emotional problems it may signify that he doesn't care about what's really bothering the patient and just wants to brush him off. Such a feeling may be justified at times, especially when the physician spends little time interviewing the patient.

With all centrally active drugs one sometimes encounters paradoxical reactions. Many of these reactions can be understood on a psychological rather than a pharmacologic basis. To do so it is necessary to consider the interaction between the drug's effects and the personality structure and defensive system of the patient. For example, some patients suffer from severe feelings of passivity, helplessness, and inadequacy which they may defend against by being physically or mentally hyperactive. Sometimes administration of a tranquilizer to this type of patient, by making him feel physically and mentally sluggish, will interfere with his major defensive patterns. He may react to this with increased anxiety and agitation. This sequence of events is especially common in adolescents but may occur in any age group.

A severely depressed 47-year-old women had a life-long reaction pattern, when faced with any type of adversity, of imposing greater and greater demands upon herself. During the year before her treatment, her life situation had become increasingly desperate. She responded to this by doubling and redoubling her physical and mental efforts. This, in turn, led to exhaustion and almost complete ineffectiveness. She was placed on Amitriptyline HCl (Elavil), an antidepressant, which has mild sedative effects. She soon complained that the drug made her feel relaxed and lazy, and this wouldn't do, because she had so much work to do; although in reality she was now accomplishing more with less effort. She also complained of the mild feeling of well-being

which the drug gave her. It appeared as though this patient could not immediately accept the mildly euphoric effects of the drug because of an intense (and unjustified) feeling of sinfulness, with a consequent need to suffer.

Patients will also complain about the side effects of drugs, even when taking placebos. It is well to remember that often such complaints, rather than being merely a concern with subjective discomfort, are ways of covertly communicating dissatisfaction with the doctor or with various aspects of the treatment. In other cases, the patient believes he is getting a placebo unless he notices some side effects; in fact, some drugs, such as nicotinic acid, with limited pharmacologic action but distinct side effects, are used to treat a wide variety of disorders. This is only one of many well known drugs which produce little other than side effects.

Everyone is familiar with the hostile-dependent patient who will call the doctor in the middle of the night for minor complaints and make numerous demands upon him but is never satisfied. One has to be especially careful when administering psychotropic drugs to such patients, since the same game can be played with drugs. Some physicians have the unfortunate experience of going through the whole pharmacopeia with a patient of this sort before finally realizing what is going on. A time-consuming, but necessary, verbal clarification of what is going on in the relationship may permit successful management of such cases.

Let's now turn to the other side of the equation: the doctor, and the relationship between doctor and patient. Because of his own needs and his personality structure, the doctor may unwittingly foster many of the attitudes in patients which we have just described. In his conception of himself as a physician, he may devalue the psychological components in the doctor-patient relationship and may feel obliged to employ organic forms of treatment even when they are inappropriate. He may have a need for his patients to worship him or to depend upon him and may unconsciously employ psychotropic drugs to further this end. The most common risk is that the doctor will be too busy to listen to the patient and may feel inadequate to deal with the patient's psychological problems. It is certainly much quicker and easier to administer drugs at such times, but under these conditions, the psychotropic drugs are least likely to be effective.

The doctor's own feelings about the effectiveness of the drug he is prescribing and the manner in which he presents it to the patient have been shown to markedly influence the therapeutic response,[1] hence the phenomenon of new drugs sometimes showing amazing effectiveness at first, followed by much more modest results after the initial enthusiasm wanes. This has led to the rule: "When a new drug comes out, use it as often as possible while it still works." It is probably true that even an effective drug attains its full effectiveness only when administered under optimum psychological conditions, which include an attitude of interest and hopefulness in the doctor.

I have only touched upon the subject of placebos. This much belabored topic will not be discussed, except for a statement by Lasagna,[2] a pharmacologist, which bears repeating:

> Certain primitive maneuvers are necessary to insure the success of this pharmaceutical charade. First, the patient must be kept unaware of the deceit. A good start is usually made with the writing of the prescription. The well known illegibility of these scripts frequently makes it impossible for a curious patient even to guess at the nature of the medicament. If the handwriting is legible, it is still likely to be in Latin. To guard against the possibility that the patient will ask the pharmacist about the contents of the prescription, physicians are well advised to steer clear of milk, sugar, or other well-known ingredients. There are available various vile-tasting and vividly colored tinctures which not only are impressive in physical properties but bear names calculated to inspire confidence in the erudition of the prescriber. Names such as ammoniated tincture of valerian can safely be revealed to the patient without upsetting the psychological applecart. Some authorities consider the color of the preparation very important. Colorless capsules are presumed to be unimpressive. One writer advises yellow, orange, or brown; another prefers pink, blue, or a mottled design. Similarly, tasteless placebos are considered inferior to a bitter or highly flavored one. It is believed that an extraordinarily large pill impresses by its size, an exceptionally small one by its "potency." An injection is thought to be more effective than something taken by mouth; presumably the presence of the nurse or physician necessary for the injection is an important component of the psychological effect.

PERSONALITY DIFFERENTIATION OF PATIENTS WITH CORONARY ARTERY DISEASE

A brief objective-type personality scale was administered to 29 patients recovering from myocardial infarction at the Albert Einstein Medical Center. The instrument was also administered to 119 non-coronary (primarily postsurgical) patients. Equating on important variables led to close matching of 24 pairs of coronary—non-coronary patients. The number of personality test items showing statistically significant differences could readily be accounted for by chance variation. This finding raises questions concerning the validity of claims that such traits are precursors of coronary artery disease.

N. RICHARD ALTLAND, PhD
ELLIS WEITZMAN, PhD

As part of a much larger investigation instituted by Krasnoff and Oscherwitz,[1] at the Albert Einstein Medical Center in Philadelphia, an especially prepared 90-item form of the Guilford-Zimmerman Temperament Survey, measuring factors G, R, and E, was administered to 29 myocardial infarction patients and 119 non-coronary disease patients, predominately postsurgical convalescents. The questionnaire assessed the following traits commonly associated with enhancement of coronary disease onset.[2]

General Activity (G): A high G score represents strong drive, energy, and activity. On the other hand, a low G score indicates slowness or inactivity. The G factor is a kind of catalyzer, for its coupling with other factors has varying interpretations.

Restraint (R): A high R score represents restraint and seriousness, and a low R score indicates a happy-go-lucky, carefree, impulsive individual. A high R score coupled with a very high G score may indicate internal conflict and consequent danger to mental health.

Emotional Stability (E): A high E score indicates optimism and cheerfulness, whereas a low E score represents depression and emotional instability. A high E score coupled with a low G score may indicate a sluggish, phlegmatic, or lazy individual. A low E score is a sign of neurotic tendency.

The acute myocardial infarction patients were matched with the non-cardiac patients on the following eight parameters: age, sex, nativity, educational attainment, source of income, occupation, social class, and smoking habits. This equating resulted in 24 matched pairs of subjects (see Table). Each of the three personality factors, each of the

90 test questions, plus failure-to-answer responses comprised the 96 independent variables of the study. Statistically significant relationships, at the 5% level of confidence, were found on the following two items: "You take life very seriously" and "When you get angry, if you let yourself go you feel better."

Although these two items may provide important clues for further investigation, none of the factors showed significant score differences between the groups, nor was there any difference in failure-to-answer scores. This study does not, therefore, reveal any measurable difference in personality traits, despite the widely-held belief to the contrary. It should be remembered, however, that this investigation dealt with post-infarction rather than precursors of coronary artery disease. On the other hand, every attempt was made, *ex post facto*, to find significant precursors among the massive data accumulated in the survey of patient background. The scope of background data is evidenced by the fact that more than 800 types of information were recorded.[1]

It is safe to assume that the two significant test questions may readily be attributed to chance when the total number of test items used is taken into account. This same conclusion may well be applied to the more flattering findings of other investigators using objective-type personality tests, especially since replication of findings is not evidenced. In view of the fact that vast numbers[3] of people are victims of coronary artery disease (more than 39% of all deaths being due to coronary artery disease) and that cardiologists' offices are filled with virtually all types of people, it is hardly likely that all of them possess a common set of emotional traits or fall into a single personality type or profile.

An eminent role in medical practice

- Clinicians throughout the world consider meprobamate a therapeutic standard in the management of anxiety and tension.
- The high safety-efficacy ratio of 'Miltown' has been demonstrated by more than a decade of clinical use.

Miltown® (meprobamate)

Indications: 'Miltown' (meprobamate) is effective in relief of anxiety and tension states. Also as adjunctive therapy when anxiety may be a causative or otherwise disturbing factor. Although not a hypnotic, 'Miltown' fosters normal sleep through both its anti-anxiety and muscle-relaxant properties.

Contraindications: Previous allergic or idiosyncratic reactions to meprobamate or meprobamate-containing drugs.

Precautions: Careful supervision of dose and amounts prescribed is advised. Consider possibility of dependence, particularly in patients with history of drug or alcohol addiction; withdraw gradually after use for weeks or months at excessive dosage. Abrupt withdrawal may precipitate recurrence of pre-existing symptoms, or withdrawal reactions including, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, the dose should be reduced and operation of motor vehicles or machinery or other activity requiring alertness should be avoided if these symptoms are present. Effects of excessive alcohol may possibly be increased by meprobamate. Grand mal seizures may be precipitated in persons suffering from both grand and petit mal. Prescribe cautiously and in small quantities to patients with suicidal tendencies.

Side effects: Drowsiness may occur and, rarely, ataxia, usually controlled by decreasing the dose. Allergic or idiosyncratic reactions are rare, generally developing after one to four doses. Mild reactions are characterized by an urticarial or erythematous, maculopapular rash. Acute nonthrombocytopenic purpura with peripheral edema and fever, transient leukopenia, and a single case of fatal bullous dermatitis after administration of meprobamate and prednisolone have been reported. More severe and very rare cases of hypersensitivity may produce fever, chills, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, anaphylaxis, stomatitis and proctitis. Treatment should be symptomatic in such cases, and the drug should not be reinstituted. Isolated cases of agranulocytosis, thrombocytopenic purpura, and a single fatal instance of aplastic anemia have been reported, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity has been reported, usually after excessive meprobamate dosage. Suicidal attempts may produce lethargy, stupor, ataxia, coma, shock, vasomotor and respiratory collapse.

Usual adult dosage: One or two 400 mg. tablets three times daily. Doses above 2400 mg. daily are not recommended.

Supplied: In two strengths: 400 mg. scored tablets and 200 mg. coated tablets.

Before prescribing, consult package circular.

Trends of the Mental Hospital Population of the United States With Special Emphasis on Maryland

KURT GORWITZ
Director of Statistics
State of Maryland Department of Mental Hygiene

For many years the patient population of state and county operated mental hospitals in Maryland and throughout the United States rose at a steady pace. After the Second World War, this increase was particularly pronounced and persisted until the middle of the 1950's.

Construction of most hospital facilities had been at a minimum during the depression years of the 1930's and came to a halt during the war. After 1945 construction usually did not keep pace with the rising patient population, resulting in almost unbelievable overcrowding and human degradation.

In Maryland, a series of newspaper articles in the Baltimore *Sun* in 1949 focused on "Maryland's Shame." A cry of surprise, shock, and indignation resounded throughout the state. Demands for action were heard everywhere. The voices were loud enough and clear enough to penetrate the Governor's ears. A similar story was told in many other states. In Maryland, as elsewhere, the answer to these dismal and disconcerting facts was to increase funds for the construction and staffing of facilities and for improved patient care and treatment. The increasing patient figures indicated an ever continuing need for more and bigger psychiatric hospitals.

A change began in 1950, the importance of which was at first not readily realized. Although the population of these facilities continued to go up, the ratio of patients to total population of the United States began to decrease. That is, the average patient population rate began to go down, slowly at first, but persistently. Beginning around 1955 the upward hospital population movement reversed in Maryland and in most other states, and a continuing decrease appeared. Every year since that time, the reported average patient population of state and county psychiatric hospitals has gone down. From a high of around 550,000 in 1955 this population has now declined 10% to approximately 490,000. In 1955, there were 342 patients in these hospitals for every 100,000 residents. Now there are 254, a decline of 25%. In Maryland, the average population size of state hospitals has dropped 17%, from a high of 9,424 in 1955 to 8,076 in 1965. This has occurred during a period when Maryland's total population increased 25%.

At the same time, the population composition of these hospitals has changed substantially, due to the large increase in admissions and releases. As shown in the table, admissions nearly doubled in the last 10 years while releases are now more than twice as large as they were in 1955. Proportionally, releases have consistently risen faster than admissions; and this has been the major factor in the decline of the patient population. At the same time, the percentage of all psychiatric hospital beds occupied by chronic patients is slowly decreasing, and the average age of hospital patients is now going down.

Based on a talk presented at the mental health seminar of the Johns Hopkins School of Hygiene and Public Health.

* Per 100,000 Total Population
** Per 1,000 Average Patient Population

A mistake which is often made is to look only at the whole without recognizing that it consists of various individual pieces which may have radically different compositions. For example, although the patient population is now 10% lower than it was in 1955, nine states have shown an increase in their hospital population during this period. Similarly, the patient population under age 25 expanded, with an average annual rise of 6.4% in the age group between 10 and 14. This later increase is largely the result of a long overdue recognition by many states of the special problems and needs of these young people. In Maryland, for example, we now have the Esther Loring Richards and Finesinger units of the Department's Institute for Children; and other facilities are contemplated.

Many other states have exceeded Maryland's decline in patient population with reductions of 30, 40, and even 50%. For the nation as a whole, substantial declines are reported in many age and diagnostic categories. What does all this mean? Have we experienced a genuine decline in our hospital populations, or has this apparent decrease simply meant that we have transferred our problems elsewhere, to such facilities as private and general hospitals, nursing homes, local welfare departments, outpatient psychiatric facilities, and others? How many released patients function adequately as family and community members? In how many cases have we provided an agent responsible for the growth and development of mental disturbances in others? In Maryland we hope to be able to study some of these factors through our Psychiatric Case Register. Many other studies are needed.

Much of the available data fortifies the belief that we have experienced a genuine decrease in the psychiatric patient population, but others are dubious, since not all the evidence is available. For example, little is known about the patient population treated in private psychiatric hospitals, in psychiatric units of general hospitals, and in the facilities of the Veterans Administration. Has the decline in patients in state facilities been balanced by an increase in these hospitals?

Nationally, data are available on only a portion of these hospitals. These statistics indicate that there are a minimum of 16,000 beds for psychiatric patients in private hospitals, 9,000 in general hospitals, and 55,000 in VA hospitals. Annually, they treat approximately 90,000, 225,000, and 110,000 patients, respectively. They thus provide 15% of all psychiatric beds and care for one-third of all hospitalized patients. However, since national figures are not available for all facilities, the changing trend in these hospitals cannot be readily determined.

In Maryland (where reports are received from all facilities), 25% of all psychiatric beds are in non-state operated hospitals (approximately half of these are at the VA Perry Point Hospital). Generally, private and VA hospitals have experienced a trend similar to state hospitals, greater patient turnover and a declining population.

It is generally accepted that psychiatric admissions to general hospitals are increasing rapidly with a rising number of facilities offering these services. Since many of these facilities handle only short-term treatment cases, their patient turnover is much greater and they account for nearly 40% of all admissions and terminations. While a large majority of patients in private and general hospitals are female, the reverse is true in state operated facilities. The preponderance of males in the state facilities is primarily due to the fact that 40% of admissions to state hospitals have a primary diagnosis of alcoholism. Nine out of ten of these patients are males.

My personal belief is that there has been a genuine decrease in state psychiatric hospital populations, although this decline is probably smaller than indicated by the usually available figures. The following facts from Maryland fortify this:

1. Admissions to state hospitals are increasing at an accelerating pace. Releases are rising even faster.
2. The psychiatric patient population in other hospitals has not increased in recent years.
3. The number of patients on foster care has not changed. Nursing home placements have been on an individual basis and are few in number.
4. Only a small number of former patients have become chronic welfare cases.
5. New drugs and available supportive services have enabled many long term patients to return to the community as functioning members.

What of the future? Some years ago President Kennedy, in his special message on mental illness and mental retardation, said, "If we launch a broad new mental health program now, it will be possible within a decade or two to reduce the number of patients now under custodial care by 50% or more."

All indications are that this numeric goal will not be attained unless there is a major change in presently existing programs. At the present time, the average size of the U. S. patient population is declining between 1 and 2% annually. However, much of this decrease has been concentrated in a few states where in many cases substantial transfers of chronic patients to nursing type facilities have taken place.

In most states chronic patients continue to occupy between 50 and 75% of all hospital beds. Treatment services are generally meager, and patients remain hospitalized until their death. In Maryland state hospitals, 54% of the patient population has been hospitalized continually for five years or more. Clearly, then, President Kennedy's hope can only be reached through a twofold program which would 1) minimize the number of new cases requiring long term hospitalization, and 2) reduce the size of our current chronic population. The former can be reached if we could reduce admissions by developing comprehensive community centers and other alternatives to hospitalization while increasing releases by providing more community supportive programs. The second objective can be reached by expanding current treatment programs, developing new treatment concepts, and increasing foster care, nursing home, and other related programs.

The attainment of these numeric objectives should never be our sole concern. It should not even be our prime concern. I do feel that we should tone down on our numbers games and reaffirm our basic aims. Clearly, we need alternatives to hospitalization. But these will be senseless unless they can be of greater and more lasting help to the patient and his family than the hospital would be. Clearly, we need to reduce the length of hospitalization and to maximize releases. But shouldn't our objective be to speed the return of the individual to an environment where he can function in a more positive manner and be more accepted by his peers? Clearly, we need more nursing homes and foster care facilities. But do we merely need more, or do we want alternatives which will provide equal or better services to the chronically ill person?

I feel that our objectives are clear and the goals are reasonable. Reduce the hospital populations? Yes; but let us seek to attain this desirable goal only through a closely coordinated program involving all potential resources and offering the best available services to our mentally ill.

HOW IMPORTANT IS THIS

IN YOUR DIAGNOSES OF SMOOTH MUSCLE SPASM?

Philips Roxane, Inc.

PERHAPS VERY IMPORTANT

The sphincter of Oddi is made up primarily of smooth muscle fibers. It permits the gall bladder to fill, regulates the flow of bile and pancreatic enzymes and in dysfunction is a primary cause of Biliary Dyskinesia. The sphincter of Oddi is but one of five major foci of smooth muscle spasm where SPACOLIN® (Alverine citrate) acts directly with rapid onset and long duration. No neurotropic side effects because Spacolin is a musculotropic counter-spasmodic unrelated to atropine or atropine-like drugs. Spacolin is not contraindicated in prostatic hypertrophy.

SPACOLIN® (Alverine citrate)

Each tablet contains: Alverine citrate .....120 mg.

INDICATIONS: Smooth muscle spasmolytic for use in spastic colon, spastic conditions of the gastrointestinal tract, biliary dyskinesia, cholecystitis, spasm associated with peptic ulcer,* achalasia, pylorospasm, spasm attendant to diarrhea, spastic conditions of the genitourinary tract attributable to inflammation and calculi, certain primary dysmenorrheas and as an aid in cystoscopic, esophagoscopic and gastroscopic examinations. DOSAGE: One tablet after meals 1 to 3 times daily at discretion of physician. When treating spasm associated with peptic ulcer, achalasia or pylorospasm, administer tablets ½ hour before meals. In dysmenorrhea, one tablet 3 times daily starting at onset of discomfort. PRECAUTION: Caution is recommended when using in hypotensive patients. SIDE EFFECTS: In common with other smooth muscle depressants, Spacolin temporarily lowers blood pressure.

*Antacid and dietary measures are of primary importance in ulcer treatment and should not be neglected.

POWER OF THE STATE TO IMPOSE MEDICAL TREATMENT

L. WHITING FARINHOLT, JR.
Professor of Law,
University of Maryland Law School

WILLIAM J. O'DONNELL
State's Attorney, Baltimore City

Moderated by Howard F. Kinnamon, MD

DR. KINNAMON: Our topic tonight might sound confusing from its title, "Power of the State to Impose Medical Care." This is not the program of socialized medicine that is so frequently discussed but that of the State's authority to authorize medical care to a child whose parents for one reason or another refuse this care; or to a wife who needs surgery and transfusion but refuses on religious grounds. There is also the problem of innoculations, vaccinations, and other immunizations required by law.

When a child needs an operation; when a mother needs a transfusion and probably surgery, and permission is refused, what do we as doctors do? To whom do we turn? If permission is granted by the courts and the outcome of the surgery is not what was hoped for, what is the medical responsibility?

Our panel is composed of two able men. One is a professor at the University of Maryland Law School and a member of Medicolegal Committee for many years, Mr. Whiting Farinholt. The second participant is Mr. William O'Donnell, states attorney of Baltimore City, a very astute, able young man. These young men are going to tell us the legal responsibilities to the child and to the adult.

MR. FARINHOLT: I am glad to be here this evening and to have been asked to participate as a member of this panel tonight. It is a real honor as well as a responsibility.

A number of times in the past I have had the opportunity to talk to a mixed audience, such as this, composed of members of our two disciplines, medicine and law. I find it always a most difficult task on these occasions, since one's remarks are often likely to be found either overly elementary or, on the other hand, incomprehensible, depending upon the particular profession of the individual listener.

Tonight my comments will be addressed, in the main, to the members of the medical fraternity. My object is to present for their interests, and possibly for their enlightenment, some of the legal problems, concepts, and formulas relevant to our subject. In no sense will this be the sort of presentation one would prepare as an argument for a court, nor even a discussion before a law club; rather, it is an attempt to provide a quasi-legal climate for members of the medical profession, so that, at the conclusion of my remarks we can possibly indulge in a sensible discussion as to some of the points therein.

I have a firm conviction that whenever members of separate disciplines get together and more or less calmly discuss matters and issues common to both of them, something of benefit to each discipline results. This, it seems to me, is particularly true in our two professions, law and medicine. Whether we individually like it or not, circumstances require us to work together, and cooperation is made more palatable, even pleasant and fruitful, when each knows something of the other's problems, attitude, and approaches.

In discussing the manner of presenting our subject tonight, Mr. O'Donnell and I decided that we would divide the basic question into two areas and that I would deal primarily with that area in which children are involved; that is to say, those

Medicolegal symposium presented May 20, 1964, Baltimore.

situations where a parent neglects to provide medical care for his child, or, more importantly, where the parent refuses to permit the child to undergo medical treatment which is necessary for the child's health or even for his life.

First, a few basic and fundamental concepts should be stated. These are self-evident and elementary; but as a foundation for the discussion, they at least need to be mentioned. An individual who is neither incompetent nor under some sort of legal disability may reject medical care for himself. He may not be forced to submit to medication or surgery. The privilege or right to refuse treatment is practically absolute, even in the face of inevitable death. There have been a number of cases in which a physician or hospital has been held civilly liable in tort for battery when the surgeon has proceeded without the consent of the patient or has exceeded the consent granted.

There is a story of a famous surgeon associated with one of our great eastern hospitals. While conducting a brain operation involving the removal of a tumor, there were a number of other surgeons around him observing his extreme skill and dexterity. When he completed this difficult but successful operation, his fellow surgeons broke into applause. Apparently this overwhelmed the good doctor. The acclaim went to his head, and he, by way of an encore, performed a circumcision.

His additional conduct, of course, is beyond the consent granted and would amount to a tort—a battery in the language of the law. Some measure of consent must be obtained from the patient or from one on his behalf; otherwise an action for damages will lie.

This is not news, of course, to you, I am sure. However, the question of consent is itself a truly sticky problem. It is not my purpose to investigate with you this area at the moment. Numerous perplexing problems may arise, among them, who may consent, under what circumstances may consent be implied, what are the essential elements of consent, and so forth. My colleague, Mr. O'Donnell, will deal with this area.

An excellent article, entitled "Consent to Operative Procedures," was published in the *Maryland Law Review* in 1961 and was reprinted with slight modification in your own *Maryland State Medical Journal,* in the June, 1963, issue. Its author, Robert Powell, when he started this work, was a member of my Medicolegal Seminar, and I am indeed proud of the beginning he made there and of the final effort as it has been published.

As the primary basic proposition, then, a physician or any other person who treats an individual without his permission and against his will is answerable in civil damages.

A second fundamental concept, relevant here, is the right of parents or those who stand in *loco parentis,* such as a guardian, to the custody and control of a minor child.

A third basic concept is that the sovereign, the State, has inherent power under the police power to provide within reasonable limits for the health, safety, and general welfare of society. This latter concept, when applied to the sovereign's power of guardianship over a person with a disability, as, for example, a minor child, is known as *parens patriae.*

These three basic propositions: 1) the need for consent or permission before medical treatment is administered; 2) the right of the parent to control the child; and 3) the power of the State to act as guardian of one under disability—define the area of our discussion. It is the resolution of these often conflicting principles that is our aim tonight, as it has been the aim of the court when confronted with a situation in which parents deny their child medically indicated professional treatment.

There developed in this country and in the State of Maryland two separate approaches for handling the problem of medical care for children over the parental objection: first, statutes invoking criminal sanctions for neglectful parents; and, second, those empowering juvenile courts to remove the child from the custody of the neglectful parent.

Obviously, the first or criminal approach is effective only as an *ex post facto* sanction to punish the parents for the failure to perform a legal duty; that is, to give adequate care to the child. Unfortunately, it does little to benefit the child, and none if the child has died because of parental neglect.

Even in the absence of statute, the common law uniformly places upon the parent an obligation to provide for his offspring in sickness or ill health. This view has been codified into the Maryland Code, Article 72A, Section 1: The mother and father are jointly and severally charged with "support, care, nurture, welfare, and education of their minor children."

"Support, care, nurture, welfare, and education." It may be noted that the statute does not mention medical care in specific terms. However, in a recent case, Craig vs State, (220 Md 590, 1959) the parents were criminally indicted and prosecuted for involuntary manslaughter for failing to provide medication and medical care for their ill child. Though the case did not result in conviction, for another reason, it would seem to be adequate authority to support the contention that failure of a parent to provide medical care for his offspring is a violation of the criminal law.

Under the second approach, that is, the removal of the child from parental custody, our local statute setting up the juvenile court system under which a child may be withdrawn from the parents' control and custody is more explicit regarding medical care. "Medical care" is specifically set forth in Article 26 Section 51 et seq.

Thus by statute and case law, we clearly recognize parents as the natural guardians of their minor children and that they are entitled to their care and custody. Yet this right is a qualified one which may be forfeited either if the parents become unfit to retain custody or, under exceptional circumstances, if continued custody of the parents would be detrimental to the best interests of the child.

The cases Mr. O'Donnell will cite and describe, I am sure, will illustrate that there are parents, unfortunately, whose claim to parenthood and the rights thereunder are little more than biologic.

Thus Article 26, section 51, gives the circuit court of each county jurisdiction in juvenile causes. Section 52, subsection 4 of that same article defines a neglected child as a child "whose parents, guardian, or custodian neglects, refuses, when able to do so, to provide necessary medical, surgical, institutional, or hospital care for such child."

Section 53 gives the judge of the juvenile court original exclusive jurisdiction, both over the child who is "dependent, delinquent, neglected, or feebleminded," and over the parents who contributed to or caused the child to be brought within the jurisdiction of the court.

Under this section of the Code, permitting the State to remove the child from parental custody and to impose medical care upon him over the objection of the parent, the procedure is basically simple. A petition is filed in court alleging that a specific child is being neglected and stating the basis for such allegation. On the basis of this petition, the court decides whether or not it has jurisdiction, and, deciding that it does, conducts a hearing to determine the question of neglect. If the court determines the child to be neglected, an order may be issued committing the child to a guardian, who is authorized then to consent to the medical care which is deemed necessary.

In reaching a decision, the court has at its disposal social and medical data reports compiled by the Department of Public Welfare and has access to other medical opinion. It is usual in such cases that a conference be held with the dissenting parents in an effort to persuade them of the importance of the child's obtaining medical attention. Only when such efforts fail does the court overrule the parents' objections and enter an order committing the child.

When failure to provide medical care is the only basis for finding neglect, the commitment is usually temporary; after the needed medical treatment has been provided, custody of the child usually reverts to the parents without further court action.

Though the "juvenile causes" section of the Code, Article 26, which provides for the removal of the child from the parent's custody, has apparently been invoked rather frequently, there is little case law interpreting the statute. Newspaper accounts and personal interviews with juvenile court officials, pediatricians, and others indicate that several times petitions for change of custody of children on grounds of parental failure to provide necessary medical care have been filed and acted upon.

Clearly, then, we have the procedure for removing the child from the parent's custody. But what are the criteria for effecting the removal? Specifically, under what circumstances will a child whose parents refuse him medical care be characterized as neglected so that the situation falls within the statute? What is necessary medical care?

These are questions which, in each case, must be determined on the facts of that case. There are a number of factors which have been given weight by the courts in deciding whether or not parental failure to provide medical care for their child constitutes neglect within the meaning of the statute and, therefore, justifies commitment of the child and an entry of the order for the indicated medical treatment.

For example, the court will consider whether the

A Key Site of Action of the Protoveratrine A in Salutensin

"The main function of the carotid sinus is regulation of the blood pressure...."[1]

The veratrum component of Salutensin acts here (and in the myocardium), initiating "...a reflex fall in blood pressure through a generalized vaso-dilation and fall in heart rate."[2]

SCHWENK

This is a logical Blood Pressure Regulator

BECAUSE IT ENHANCES THE BODY'S OWN MECHANISMS FOR REDUCING BLOOD PRESSURE

In mild to moderate hypertension:

Salutensin enhances the body's own mechanisms for lowering blood pressure. The veratrum component of Salutensin acts on the carotid sinus and myocardial receptors, initiating "...a reflex fall in blood pressure through a generalized vasodilation and fall in heart rate."[2] To achieve this reflex modification of hypertension, Salutensin utilizes protoveratrine A. In addition, to facilitate and maintain blood pressure reduction, Salutensin incorporates reserpine and a highly effective thiazide. In general, side effects have been reported infrequently but may include those listed in the therapeutic summary.

Simple dosage—low-cost therapy: Many patients on Salutensin respond to 1 tablet *b.i.d.* Long-term economy is assured, since dosage can frequently be lowered after initial control is established.

Available: Prescription-size bottles of 60 tablets.

References: 1. Editorial: JAMA *191*:592 (Feb. 15) 1965. 2. Meilman, E., in Moyer, J.H.: Hypertension, Philadelphia, W. B. Saunders Company, 1959, p. 395.

BRISTOL THERAPEUTIC SUMMARY
For complete information consult Official Package Circular.
Indications: Essential hypertension.
Warnings: Small-bowel lesions (obstruction, hemorrhage, perforation) have occurred during therapy with enteric-coated formulations containing potassium, with or without thiazides. Such potassium formulations should be used with Salutensin only when indicated and should be discontinued immediately if abdominal pain, distention, nausea, vomiting or gastrointestinal bleeding occurs.
Contraindications: Salutensin is contraindicated in severe depression.
Precautions: Azotemia, hypochloremia, hyponatremia, hypochloremic alkalosis and hypokalemia (especially with hepatic cirrhosis and corticosteroid therapy) may occur, particularly with pre-existing vomiting and diarrhea. Potassium loss, which may cause digitalis intoxication, responds to potassium-rich foods, potassium chloride or, if necessary, stopping therapy. Serum ammonia elevation may precipitate coma in precomatose hepatic cirrhotics. Discontinue therapy two weeks before surgery or if myocardial irritability, progressive azotemia or severe depression occur. Exercise caution with patients with peptic ulcers or renal insufficiency (if severe, Salutensin is contraindicated).
Side Effects: Hydroflumethiazide: Purpura plus or minus thrombocytopenia, hyperuricemia, leukopenia, hyperglycemia, glycosuria, malaise, weakness, dizziness, fatigue, paresthesias, muscle cramps, skin rash, epigastric distress, vomiting, diarrhea and constipation. *Reserpine:* Depression, peptic ulceration, diarrhea, Parkinsonism, nasal stuffiness, dryness of the mouth and, with overdosage, agitation, insomnia and nightmares. *Protoveratrine A:* Nausea, vomiting, cardiac arrhythmia, prostration, excessive hypotension and bradycardia. (Treat bradycardia with atropine and hypotension with vasopressors.)
Usual Dose: 1 tablet *b.i.d.*

BRISTOL

Each tablet contains: protoveratrine A, 0.2 mg.; hydroflumethiazide, 50 mg.; reserpine, 0.125 mg.

failure to provide medical treatment is likely to result in the death of the child. If the child's life is at stake, the courts more frequently overrule parental objections and order the needed care. If some lesser degree of peril is involved or if no present emergency really exists, courts may refuse to intervene.

More often than not, however, even when the courts find that no imminent danger threatens the child's life, it will nevertheless find that the danger of gross deformity or mental incompetence, which might result from failure to carry out the needed treatment, is sufficient basis to sustain a finding of neglect.

Further, the court considers also whether the treatment itself will involve any risk to the life or health of the child. If the risk that the treatment may not be successful is substantially great and may cause the child's death or a more severe handicap than existed prior to the operation, the courts are disinclined to interfere. In such cases, the parents are allowed a greater degree of discretion in deciding whether or not to submit the child to this greater risk. If, however, the prognosis for recovery is favorable and all other factors are favorable, the courts will not hesitate to order treatment.

In addition, some consideration is given to the question of whether the treatment might be expected to have an adverse psychological effect on the child. At least one New York case indicates that when such a possibility exists, the court will not order treatment over the parent's objection. Quite possibly, the converse of this would be true also.

Also, although the parents are allowed considerable discretion in the custody, care, and control of their children, and although the courts will give their rights as parents every consideration, yet even greater importance is attributed to the right of the child to live and, whenever possible, to live a healthy, happy, useful life in which, hopefully, he can be self-supporting. A parent is not permitted to allow his own personal convictions to cause the death of the child or to ruin his child's chances for a normal life.

Finally, there is the consideration that it is to the State's interest to see that the children become normal, useful citizens rather than public wards. This interest may override parental rights if parental action is detrimental to the child's health and welfare.

The factors I have mentioned are merely general considerations. Nowhere, to my knowledge, are cases more highly individualized than in this area. Nowhere is the necessity for deciding each case on its particular facts more important. The slightest variation of facts in one instance may justify results completely different from that reached in another.

Only one general proposition may be stated with complete certainty: The courts will not tolerate abuse or neglect of children, and the State, through its courts, will protect its youth and will do so jealously.

There is a very important problem inherent in any restraint of a natural right, a problem I have avoided up to this point, viz., the constitutionality of our statutes and the procedures under them. When religious scruples are the basis for parental refusal to submit their child to medical care, is it not a denial of religious freedom, guaranteed by the First and absorbed into the Fourteenth Amendment of the Federal Constitution, to order medical treatment contrary to the wishes of the parents?

As many times as this question has been ruled upon by state appellate courts, I have yet found no case which has reached the Supreme Court of the United States. I understand that there is one before it now, and Mr. O'Donnell will discuss it with you. I am certainly waiting with anxious anticipation to hear what the Supreme Court will say; but at the moment, state courts, it seems to me, have answered the constitutional objections rather adequately.

The First Amendment of the Federal Constitution forbids Congress "to make any law respecting the establishment of religion or prohibiting the free exercise of religion." The Fourteenth Amendment, as I have already suggested, has been construed by the Supreme Court as making the provisions of the First Amendment equally applicable to the states.

Courts in this country have, in general, recognized that religious freedom comprehends two separate concepts: first, the freedom to believe, and, second, the freedom to act.

Without exception, freedom of religious belief is held to be absolute, subject to no restraints by the states. Freedom to act upon one's religious beliefs, however, is subject to regulation for the protection of society. The state is charged with the duty not only to preserve individual liberties guaranteed by the Constitution but also to protect

society in general from danger. When one's exercise of his personal rights unduly interferes with the legal rights of others, it is generally agreed that some form of restriction upon personal action is in order.

When the state enacts laws to protect the public health, welfare, and safety, it is said to be exercising its police powers. Although the police power itself of the state no longer seems to be subject to any serious controversy, problems still arise occasionally as to the scope and extent of that power. Generally, laws enacted pursuant to the police power of the state are accorded liberal construction. The only significant limitation imposed upon the state in this respect is that such laws, the so-called police power laws, must not be so unreasonable and extravagant as to interfere unnecessarily and arbitrarily with the property and personal rights of citizens. Whether or not a state law is invalid because it violates this limitation can be determined only on a case-by-case basis.

A number of state court cases have considered the constitutional objections raised against laws imposing a duty upon parents to provide medical care for their minor children and providing procedures to assure that abuses of this duty are corrected. These cases have held that the enactment and enforcement of such laws are within the police power of the state and not violative of the petitioner's religious freedom or any other constitutional right. Such was the holding of our own Court of Appeals in 1959 in the Craig case in which, on the ground that it conflicted with their religious beliefs, the parents refused medical aid to a child who was ill with pneumonia and who subsequently died.

In that case, in answer to the contention that the defendants' freedom of religion had not been respected, the court said:

> In prosecuting for the breach of duty imposed by statute to furnish necessary medical aid to a minor child, the particular religious belief of the person charged with the offense constitutes no defense. He cannot, under the guise of religious conviction, disobey the laws of the land made for the protection of the health and safety of society.

The court continued, saying that the State of Maryland was vitally concerned with the health and safety of its children and in the obedience of its children to its laws. The parents were at perfect liberty to believe in the religion of their selection. They might pray, anoint, or call in the elders of their church in case of sickness of their minor children; but they, like all parents, must also obey the mandate of Article 72A, Section 1, by providing medical aid when the circumstances properly require it.

In an Illinois case (People v. Labrenz, 104-NE2d769, 1952) which is discussed in an interesting and well-written little article, entitled "Parens Patriae," in the November, 1954, *New England Journal of Medicine,* the Supreme Court of Illinois answered the religious objection in more or less the same way as the Maryland Court, saying this:

> Concededly, freedom of religion and the right of parents to the care and training of their children are to be accorded the highest possible respect in our basic scheme. But neither the rights of religion nor the rights of parenthood are beyond limitation. Indeed, the early decisions in the Reynolds case, upholding a Mormon's conviction for bigamy against the defense of interference with religious freedom as guaranteed by the First Amendment, leaves no doubt about the validity of the action taken here. Laws are made for the government of actions and, while they cannot interfere with mere religious belief and opinions, they may with practices.

The decisions of the state courts in the child-neglect cases and in other similar cases find authority in early decisions of the Supreme Court in related areas. There are two leading decisions of the Supreme Court that enunciate the principles usually invoked to sustain governmental regulation for the protection of public health, welfare, and safety.

The first case dealt with the power of the state to compel vaccination of its inhabitants (Jacobson v. Mass. 197 U.S. 11, 1905). The second (Buck v. Bell, 274 U.S. 200, 1927) concerned compulsory eugenic sterilization of a mentally defective. In each, the state's action was held not to be a denial of due process.

In each of these cases the constitutionality of the police powers of the state was questioned. In each, the Supreme Court held that public health and welfare would be served by the statutes in question and that a public good could be shown which would empower the state to subordinate the rights of the individual involved to the public purpose to be accomplished.

There have been a number of cases in which statutes have been upheld even though they prohibited certain religious practices. Among them were polygamous marriages, selling of religious papers, possession of a drug called peyote, which apparently was part of the religious practices of a particular group, and fortune-telling, even

Pro-Banthine
(propantheline bromide

Intragastric photography has provided a new and precise method of measuring the effectiveness of anticholinergic drugs. The transition from gastric motor activity to relaxation seen with effective doses of such drugs takes only a few seconds and is easily demonstrated.

The importance of vagal stimulation of gastric hyperacidity and hypermotility makes such measurements particularly important in evaluating the parasympatholytic effect of drugs used in patients with peptic ulcer, gastritis, biliary dyskinesia and other gastrointestinal disorders.

Pro-Banthine has been shown[1] to produce complete gastric motor inactivity with doses of 6 to 8 mg. intravenously. Comparison tests were made with the belladonna fraction, atropine. Measured usual dosage unit versus usual dosage unit, Pro-Banthine was more than four times as effective as the belladonna alkaloid.

See fo

Indications: Peptic ulcer, functional hypermotility, irritable colon, pylorospasm and biliary dyskinesia.

Oral Dosage: Adequate dosage should be given for optimal results. For most *adult* patients this will be four to six 15-mg. tablets daily in divided doses. In severe conditions as many as two tablets four to six times daily may be required. Pro-Banthine (brand of propantheline bromide) is supplied as tablets of 15 mg., as prolonged-acting tablets of 30 mg. and, for parenteral use, as serum-type ampuls of 30 mg.

Side Effects and Contraindications: Urinary hesitancy, xerostomia, mydriasis and, theoretically, a curare-like action may occur. Pro-Banthine is contraindicated in patients with glaucoma, severe cardiac disease and prostatic hypertrophy.

1. Barowsky, H.; Greene, L., and Paulo, D.: Cinegastroscopic Observations on the Effect of Anticholinergic and Related Drugs on Gastric and Pyloric Motor Activity, Amer. J. Dig. Dis. *10*:506-513 (June) 1965.

ds Effective

yourself

Complete gastric relaxation with Pro-Banthine. As this intragastric photograph demonstrates, gastric relaxation is attained with 6 mg. of Pro-Banthine intravenously; the antrum is relaxed and the pyloric orifice remains open. Full intravenous doses of atropine (4 mg.) produce no measurable effect.

SEARLE

Research in the Service of Medicine

though done by a minister of a particular religious sect as part of religious practice.

Most directly in point, I believe, is the language of the Supreme Court in another case, Prince vs. Massachusetts [321 U.S. 158, 1944]. Here was upheld a conviction of a Jehovah's Witness for permitting her minor ward to sell religious articles on the street in violation of a local ordinance prohibiting children from engaging in this kind of activity. It was held that the statute did not abridge freedom of religion. The Supreme Court, in the opinion, made the following comment, which seems applicable with equal force to the question of the constitutionality of statutes providing for compulsory medical care for infants:

> But the family itself is not beyond regulation in the public interest as against a claim of religious liberty. And neither rights of religion nor rights of parenthood are beyond limitation. Acting to guard the general interest in youth's well-being, the State, as *parens patriae,* may restrict the parents' control by requiring school attendance, regulating or prohibiting child labor, and in many other ways.
>
> The right to practice religion freely does not include liberty to expose the community or child to communicable disease, or the latter to ill health or death. . . . Parents may be free to become martyrs themselves. But, it does not follow that they are free . . . to make martyrs of their children before they have reached the age of full and legal discretion when they can make that choice for themselves.

In summation, the natural rights of the parents to the custody and control over the minor child must yield in certain instances to the power of the state. The state's power in this respect is based upon three foundations: 1) on its position as *parens patriae* for the sovereign's right of guardianship of persons under a disability; 2) on the right of a child as a citizen and a ward of the state to its protection; and 3) on the state's self-interest in its own perpetuation.

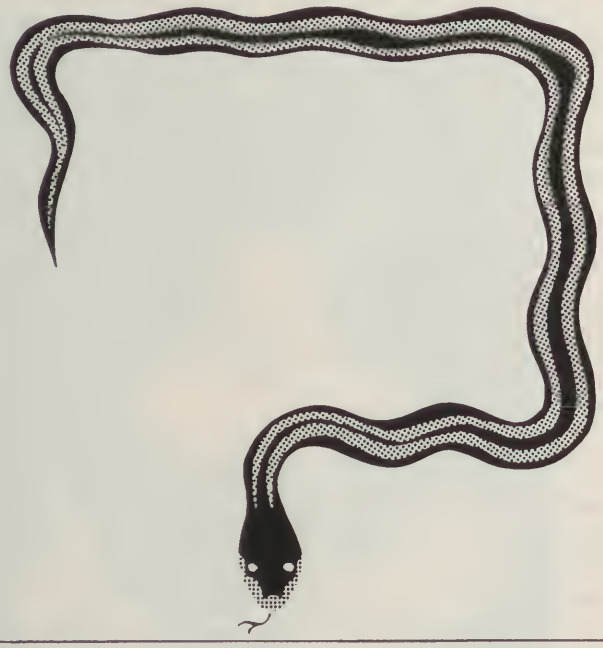
Mr. O'Donnell: It seems to me that the fundamental consideration in connection with this subject matter is in the question of consent.

There are two extremes relating to physical contact by others: a person takes the greeting of a clap on the shoulder and the jostlings of a fellow pedestrian as part of existence in society and is not permitted to clutter up the law courts with suits merely because he did not like to have such physical contact made. The applicable principle of law here involved might be expressed by saying that the law gives "no right" to the one so touched or jostled, or that he impliedly "consented to such act."

At the other extreme are physical contacts, intentionally made and in a variety of circumstances, which are of a serious nature: assaults with intent to murder, with intent to rob, with intent to rape, and even those indecent liberties which are taken and those batteries which the law recognizes as criminal.

Somewhere in between these extremes are the treatments given and operations performed by physicians and surgeons. The basic principle is that a doctor has no right to act without the consent of the patient, or, from the other point of view, a patient may give or withold permission in respect to treatment or operation. Difficult legal questions then arise as to what amounts to express consent, when can the consent be implied, and what acts constitute violations of this legal principle.

An explanation of the interlocking legal and practical aspects of the problem undoubtedly date back to the days of surgery before the development of anesthetics. We can all picture the crude diagnosis and type of operation undertaken by village barbers and others who practiced medicine in those days. One can even visualize the patient, if you may call him that, being held down by his friends on a crude table after receiving a stiff drink of whiskey. As the surgery progressed, the operator might, for the first time, discover conditions indicating a different operation or a more extensive one than had been contemplated. In those circumstances—although admittedly subject to inconveniences—it would have been possible to advise the patient of the facts and procure his consent to a change. The principle of consent became controlling.



In time, diagnostic skills increased, as they are increasing today, and anesthetics came into use; but undoubtedly, even today, there are circumstances in which examination under anesthesia permits a diagnosis which would not otherwise have been practicable or possible; progress in a surgical operation may reveal conditions which were not anticipated but which require attention and correction.

The courts have held that ordinarily the patient must be consulted and his consent given before a physician may operate on him.

The reasoning of the law is pointed out in a Minnesota case, in *Mohr* v. *Williams.* This was decided in 1905. The court held that:

"In 40 of 44 cases of irritable or spastic colon, Cantil [mepenzolate bromide] or Cantil with Phenobarbital reduced or abolished abdominal pain, diarrhea and distention and promoted restoration of normal bowel function . . . Cantil [mepenzolate bromide] proved to be singularly free of anticholinergic side-effects . . . Urinary retention, noted in two cases was eliminated in one by reducing dosage."[1]

CHARMS THE HYPERACTIVE COLON

CANTIL®

(mepenzolate bromide)

helps restore normal motility and tone

IN BRIEF:

One or two tablets three times a day and one or two at bedtime usually provide prompt relief. Cantil with Phenobarbital may be prescribed if sedation is required.

Dryness of the mouth or blurring of vision may occur but it is usually mild and transitory. Urinary retention is rare. Caution should be observed in prostatic hypertrophy—withhold in glaucoma. Cantil with Phenobarbital is contraindicated in patients sensitive to phenobarbital.

Supplied: CANTIL (mepenzolate bromide) —25 mg. per scored tablet. Bottles of 100 and 250. CANTIL with PHENOBARBITAL —containing in each scored tablet 16 mg. phenobarbital (warning: may be habit forming) and 25 mg. mepenzolate bromide. Bottles of 100 and 250.

Under a free government, a citizen's greatest right is to the inviolability of his person and this right necessarily forbids a doctor who has been asked to examine, diagnose and advise, to place a patient under anesthesia for an operation without the knowledge and permission of the patient.

The court in its opinion stated:

There is logic in the principle thus stated, for, in all other trades, professions, or occupations, contracts are entered into by the mutual agreement of the interested parties and are required to be performed in accordance with their letter and spirit. No reason occurs to us why the same rule should not apply between physician and patient. If the physician advises his patient to submit to a particular operation, and the patient weighs the dangers and the result incident to its performance, and finally consents, he thereby, in effect, enters into a contract authorizing his physician to operate to the extent of the consent given, but no further.

The court then pointed out that when a patient understands the nature of the condition to be corrected, a doctor is allowed a wider latitude of discretion in his treatment and may go farther in cases of emergency. Emergencies may arise prior to or during the course of the operation.

Of course there are some circumstances when consent is said to be "implied"; this is another way of saying that although no express consent was given by the patient, it would not be required. When a patient presents himself for diagnosis and treatment and accepts that which is given, although nothing has been said about it, there is a legal presumption that he has consented. A form of consent, whether it be classed as "express" or "implied," occurs when a patient indicates his condition generally to the doctor and in effect says to him, "Take care of it."

Treatment rendered or an operation performed in an emergency falls within the rule of implied consent, although such treatment or such operation may not be more extensive than reasonable and necessary.

The doctrine of implied consent has been extended to emergencies when one considers the impracticability of restoring an unconscious patient to consciousness in order to explain to him a need for changing procedures, to then secure his consent, to put him back under anesthesia, and then to proceed as authorized.

To meet some of these limitations, you are familiar with the extensive use of waivers.

Except in cases of emergency, a child is held generally to be incapable of giving consent, and such consent must be obtained from the father. It is doubtful, under the decisions, whether such consent can be given by an aunt or other relative with whom the child may be temporarily residing, as on a vacation.

Consent by a father is not necessary in case of an emergency, although a question may arise as to what facts create the emergency. A clear case of emergency existed when a 15-year-old boy had his foot crushed by a train and was found unconscious. The surgeon who amputated without the consent of either the boy or his father was held by the Michigan courts not to be liable.

In a New York case, *Sullivan* v. *Montgomery*, decided in 1935, the question was discussed of the consent by a minor, 20 years of age, who fractured his ankle playing baseball. The court in that case said, as part of its opinion:

While the courts are not entirely in harmony upon the question of consent to the administration of an anesthetic, the better reasoning supports the proposition that if a physician or surgeon is confronted with an emergency which endangers the life or health of the patient, or that suffering or pain may be alleviated, it is his duty to do that which the occasion demands within the usual and customary practice among physicians and surgeons in the same locality. Many persons are injured daily in our city, and emergency cases constantly arise. To hold that a physician or surgeon must wait until perhaps he may be able to secure the consent of the parents, who may not be available, before administering an anesthetic or giving to the person injured the benefit of his skill and learning, to the end that pain and suffering may be alleviated, may result in the loss of many lives and pain and suffering which might otherwise be prevented.

The court continued:

I do not believe that those who have devoted their lives to humanity will wantonly administer an anesthetic or fail to obtain the consent of the parents before administering an anesthetic where such consent may be reasonably obtained in view of the emergency; it would be altogether too harsh a rule to say that under the circumstances disclosed by the testimony in the instant case, the defendant should be held liable because he did not obtain the consent of the father to the administration of the anesthetic; as the defendant was confronted with an emergency, and as he obtained the consent of his patient, I hold that the consent of the father was not necessary.

Of course, in this case, the minor was 20 years of age.

A different point of view was pointed out in a District of Columbia case decided in 1941, *Bonner* v. *Moran*. The mother of a 15-year-old boy was ill, and he was living with an aunt and cousin away from the mother's home. The cousin was crippled as a result of burns and it was felt that

DACTILASE®

Each tablet contains:
Dactil® (piperidolate hydrochloride), 50 mg.;
Standardized cellulolytic* enzyme, 2 mg.;
Standardized amylolytic enzyme, 15 mg.;
Standardized proteolytic enzyme, 10 mg.;
Pancreatin 3X** (source of lipolytic activity), 100 mg.; Taurocholic acid, 15 mg.

*Need in human nutrition not established.
**As acid resistant granules equivalent in activity to 300 mg. Pancreatin N.F.

In chronic or acute indigestion, fluttery, gassy stomachs obtain prompt, gratifying relief through the antispasmodic, surface anesthetic and enzymatic activity of Dactilase. Dactilase decreases hypermotility and pain and reduces the production of gas. Dactilase does not induce stasis, but helps restore normal tone. It has little or no effect on enzyme secretions, but *adds* enzymes, thus contributing to the digestive efficiency of the patient.

Side Effects and Contraindications: Dactilase is almost entirely free of side effects. However, it should be withheld in glaucoma and in jaundice due to complete biliary obstruction.

Administration and Dosage: One tablet with, or immediately following, each meal. Tablets should be swallowed whole.

Supplied: Bottles of 60 and 250.

a skin graft would help her condition. Without notifying the mother, the aunt made arrangements with a surgeon who attempted a graft from the boy to the cousin. The child remained in the hospital for two months. The court commented on the fact that even though the boy could have understood the nature of the operation, there was no evidence that it had been explained to him. It was held that the consent of the aunt was legally insufficient. The court in its opinion said:

> In the great majority of the states, the question seems never to have arisen, nor are there any federal cases on the subject. However, the general rule is that the consent of the parent is necessary for an operation on a child.
>
> We think that there can be no doubt that a surgical operation is a technical battery, regardless of its results, and is excusable only when there is express or implied consent by the parents; or, stated somewhat differently, the surgeon is liable in damages if the operation is unauthorized. Here, as we have already seen, the question is whether the consent of a boy 15 years of age dispenses with the necessity of consent by his parents. The trial court decided that it did. . . . In deference to common experience there is general recognition of the fact that many persons by reason of their youth are incapable of intelligent decisions, as the result of which public policy demands legal protection of their personal as well as their property rights. . . . Hence it is not at all surprising that, generally speaking, the rule has been considered to be that a surgeon has no legal right to operate upon a child without the consent of his parents or guardians.
>
> There are, of course, exceptions to this rule. One is in the case of emergency, when obviously an operation is necessary; others perhaps in cases in which the child had been emancipated (reached the legal age) or where the parties are so remote as to make impracticable the obtaining of their consent in time to accomplish proper results. And when the child is close to maturity, it has been held that the surgeon may be justified in accepting his consent.
>
> But in all such cases the basic consideration is whether the proposed operation is for the benefit of the child and is done with the purpose of saving his life or limb. The circumstances in the instant case are wholly without the compass of any of these exceptions. Here the operation was entirely for the benefit of another and involved sacrifices on the part of the infant of fully two months of schooling, in addition to serious physical pain and possible results affecting his future life.

As we have seen in the great majority of cases where this problem has come to the courts, it has involved minors, those who legally are considered incapable of entering into a contract and thus incapable of legally consenting.

Since, too, we have seen from those cases cited that generally a minor can be said to have impliedly consented in cases of emergency, resort has been made to the courts for a judicial determination that an emergency does in fact exist. It is fairly easy to work out the rationale of the action of the courts in cases of minors under the always present legal principle that the court will do that which is in the best interests of the minor.

When we come into the area of the power of the state to impose medical treatment—immunizations and general medical care on one who is *sui juris*—the problem is much more difficult.

That the state has the right to protect life cannot be seriously questioned. Self-destruction or, if you will, suicide was a felony under English Common Law. The lands and goods of the offender, as in the cases of other felonies, were forfeited to the king and the body was ignominiously buried in the highway. The suicide was deemed a felon, the murderer of himself. You may whimsically be asking yourselves: How did the state prosecute a suicide? Obviously there was no prosecution, but his lands and goods were forfeited, as were those of any other felon. Attempts to commit suicide were, however, indictable as an attempted felony, and those who aided, abetted, and assisted in the commission of the suicide or attempted suicide were indicted, tried, and convicted.

An early English case, *Rex* v. *Dyson*, decided in 1823, held that if two persons entered into a suicide pact, that is, if they mutually agreed to kill themselves, respectively, or one to kill the other, and the means employed by them took effect only upon one, the survivor was held to be guilty of the murder of the one who died.

Chief Justice Gray, in the case of *Commonwealth* v. *Mink*, decided in Massachusetts in 1877, said this:

> Suicide being unlawful and criminal, as *malum in se*, any attempt to commit suicide is likewise unlawful and criminal. Everyone has the same right and duty to interpose to save a life from being so unlawfully and criminally taken, that he would have to defeat an attempt unlawfully to take the life of a third person. . . . And it is not disputed that any person who, in doing or attempting to do an act which is unlawful or criminal kills another, though not intending his death, is guilty of criminal homicide, and at least manslaughter.

Closely akin to the prohibition against the affirmative taking of one's life, the law also punishes those who by acts of criminal omission cause one to die. Criminal responsibility in such situations arises only when there is an omission of a *legal* duty owned by the defendant to the deceased and such omission was the proximate cause of the death. The indispensable ingredient for criminal liability in such cases is the existence

For cold hands and feet, nothing beats hot stoves—but they *are* awkward to carry around. Now Gerilid, in good-tasting take-along chewable tablets can provide rapid vasodilation of peripheral circulation, bringing real warmth to the extremities and decreasing sensitivity to sudden temperature change. Patients *like* Gerilid and *know* they are getting relief.

WARMTH
FOR COLD
HANDS AND FEET

GERILID™

Each chewable tablet contains:
nicotinic acid (niacin) 75 mg. and
aminoacetic acid (glycine) 750 mg.

Administration and Dosage: One or two chewable tablets 3 times a day before meals. If flushing is objectionable, dosage may be lowered. However, tolerance to flushing usually develops without loss of efficacy in regard to vasodilation. The recommended dosage should not be exceeded.

Side effects: Occasional lightheadedness or transient itching which may disappear with continued use. There are no known contraindications; however, caution is advised when there is a concomitant administration of a coronary vasodilator.

Supplied: Packages of 50 chewable tablets.

Also available in liquid form as Geriliquid®, in bottles of 8 and 16 ounces.

of a legal duty toward the person suffering the harm.

The abstention of a bystander who remains passive while a murder is committed in his presence is an insufficient fundamental ingredient for criminal liability in such cases. Failure to perform acts of mercy or the shirking of moral obligations do not alone, without a legal duty flowing from the accused toward the deceased, supply the underpinnings for criminal liability. The case of *Regina* v. *Instan,* a Queen's Bench decision in 1893, illustrates the point very well:

The unmarried defendant was living with an aunt 73 years of age and was maintained by her. They lived alone in the household unattended. Shortly before her death, the aunt became incapacitated by a gangrenous leg, was virtually immobilized, and was incapable of helping herself. No one knew her condition but the defendant; she continued living in the house at the cost of the deceased, using food supplied them by the tradespeople. The niece gave no food to her aunt and failed to provide medical and nursing attention to her. Although the niece frequently spoke with her neighbors, she made no mention whatsoever unto them of the condition of her aunt. The cause of death was listed as "exhaustion caused by the gangrene, but substantially accelerated by neglect, want of food, of nursing, and of medical attendance." Her conviction by a jury was upheld by the Queen's Bench in an opinion by Lord Coleridge, who said:

> It would not be correct to say that every moral obligation involves a legal duty; but every legal duty is founded on moral obligation. A legal common law duty is nothing else than the enforcing by law of that which is a moral obligation without legal enforcement. There can be no question in this case that it was the clear duty of the prisoner to impart to the deceased so much, as was necessary to sustain life, of the food which she from time to time took in, and which was paid for by the deceased's own money for the purpose of the maintenance of herself and the prisoner; it was only through the instrumentality of the prisoner that the deceased could get the food. There was, therefore, a common law duty imposed upon the prisoner which she did not discharge.

The lack of a legal duty to act is pointed out in a Michigan case, *People* v. *Beardsley,* decided in 1907—and I might say, parenthetically, we used this case in connection with our investigation as to whether or not we had any criminal action to be brought in connection with the death of "Big Daddy" Lipscomb.

In this case, a manslaughter conviction against the defendant was set aside. The deceased female, 30 years of age, had previously made assignations with the defendant, a married man. At the time of the fatal episode, she had gone to his apartment with him and they had engaged in a prolonged drinking bout, toward the end of which she obtained some camphor and morphine tablets. Although the defendant physically attempted to prevent her from taking the tablets, she managed to swallow three or four grains of morphine. When the woman was reduced to the state of stupor, the defendant had another person assist him and removed the woman to the bed in another apartment. The other tenant, who had agreed to look after her, became alarmed at her condition, summoned a physician, and she was pronounced dead.

The prosecution made no claim that the defendant, Beardsley, had in any way been an active agent in bringing about her death but contended that he owed her a duty, failed to perform it, and in consequences of the failure she died.

On appeal his conviction was reversed, the court holding that there was no legal duty founded solely on a moral obligation and that the defendant was under no legal duty toward the woman to make a reasonable and proper effort to save her.

Mr. Justice Field, in giving the opinion of the court, said:

> In the absence of such (legal) obligations, it is undoubtedly the moral duty of every person to extend to others assistance when in danger; . . . and if such effort should be omitted by anyone when they could be made without imperiling his own life he would by his conduct draw upon himself the just censure and reproach of good men; but this is the only punishment to which he would be subjected by society.

There are other relationships which impose upon one the legal duty of providing medical attention for another, and the omission or neglect to perform this duty when attended with fatal results will render the one upon whom the duty is imposed liable to indictment and conviction for manslaughter; these involve cases where a woman who was acting as a "baby sitter" for compensation neglected to obtain needed care for the infant, a master who failed to provide medical care for his ill house servant, and a friend who aided and abetted a father in his neglect to provide medical attention for his sick child.

The liability to conviction in homicide cases, because of a failure to provide medical attention, is sometimes made to depend upon the question

Obstetrical or post—surgical patients requiring a dependable increase in hemoglobin will receive as much iron (250 mg. in a 5 cc. ampul) as in one pint of blood. Imferon (iron dextran injection) is less expensive and it avoids the well-recognized hazards of whole blood transfusion. When patients cannot—or cannot be relied upon to—take oral iron, Imferon (iron dextran injection) will rapidly supply needed iron for reserve stores.

ONE PINT OF BLOOD PROVIDES NO MORE IRON

THAN ONE 5 CC. AMPUL OF

IMFERON®
(iron dextran injection)

IN BRIEF: ACTION AND USES: A single dose of Imferon (iron dextran injection) will measurably begin to raise hemoglobin and a complete course of therapy will effectively rebuild iron reserves. The drug is indicated only for specifically-diagnosed cases of iron deficiency anemia and then only when oral administration of iron is ineffective or impractical. Such iron deficiency may include: patients in the last trimester of pregnancy; patients with gastrointestinal disease or those recovering from gastrointestinal surgery; patients with chronic bleeding with continual and extensive iron losses not rapidly replenishable with oral iron; patients intolerant of blood transfusion as a source of iron; infants with hypochromic anemia; patients who cannot be relied upon to take oral iron.

COMPOSITION: Imferon (iron dextran injection) is a well-tolerated solution of iron dextran complex providing an equivalent of 50 mg. in each cc. The solution contains 0.9% sodium chloride and has a pH of 5.2-6.0. The 10 cc. vial contains 0.5% phenol as a preservative.

ADMINISTRATION AND DOSAGE: Dosage, based upon body weight and Gm. Hb./100 cc. of blood, ranges from 0.5 cc. in infants to 5.0 cc. in adults, daily, every other day, or weekly. The total iron requirement for the individual patient is readily obtainable from the dosage chart in the package insert. Deep intramuscular injection in the upper outer quadrant of the buttock, using a Z-track technique, (with displacement of the skin laterally prior to injection), insures absorption and will help avoid staining of the skin. A 2-inch needle is recommended for the adult of average size.

SIDE EFFECTS: Local and systemic side effects are few. Staining of the skin may occur. Excessive dosage, beyond the calculated need, may cause hemosiderosis. Although allergic or anaphylactoid reactions are not common, occasional severe reactions have been observed, including three fatal reactions which may have been due to Imferon (iron dextran injection). Urticaria, arthralgia, lymphadenopathy, nausea, headache and fever have occasionally been reported. Initial test doses of 0.5 cc. are advisable.

PRECAUTIONS: If sensitivity to test doses is manifested, the drug should not be given. Imferon (iron dextran injection) must be administered by deep intramuscular injection only. Inject only in the upper outer quadrant of the buttock, not in the arm or other exposed area.

CONTRAINDICATIONS: Imferon (iron dextran injection) is contraindicated in patients sensitive to iron dextran complex. Since its use is intended for the treatment of iron deficiency anemia only it is contraindicated in other anemias.

CARCINOGENICITY POTENTIAL: Using relatively massive doses, Imferon (iron dextran injection) has been shown to produce sarcoma in rats, mice and rabbits and possibly in hamsters, but not in guinea pigs. The risk of carcinogenesis, if any in man, following recommended therapy with Imferon (iron dextran injection) appears to be extremely small.

SUPPLIED: 2 cc. ampuls, boxes of 10; 5 cc. ampuls, boxes of 4; 10 cc. multiple dose vials.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

PRODUCTS FOR PATIENTS YOU SEE EVERY DAY

of whether or not such medical attention is a "necessary" within the meaning of statutes requiring defendants to provide necessaries for the deceased.

In the *Craig* case, referred to by Professor Farinholt, the child became ill and died several days later of pneumonia. The parents were members of a sect which believed in calling in the elders of the church in prayer and in the "laying on of hands" to cure an illness. The Craigs followed all of these religious procedures but did not summon in medical aid, and the child died. They were convicted by the Circuit Court for Washington County of manslaughter, but the conviction was reversed by the Court of Appeals.

The Court held that Article 72A, Section 1, of the Maryland Code, which charges parents with the "support, care, nurture, welfare, and education" of their minor children embraced as well the obligation to furnish medical care.

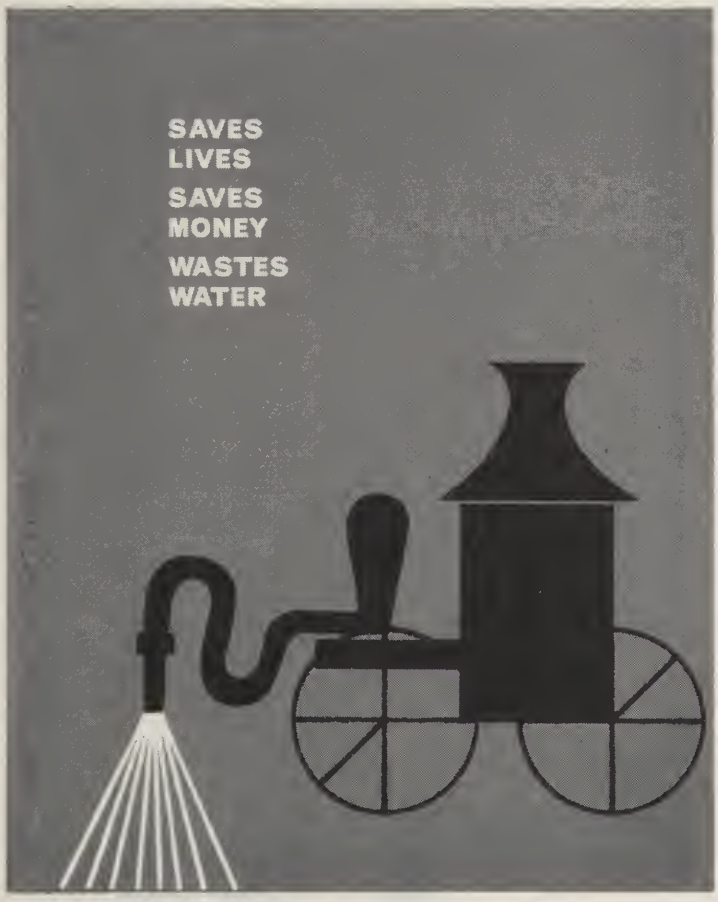
With the overtones of religious principles throughout the case, the Court of Appeals reversed the conviction because of the insufficiency of the evidence offered to show that the parents were guilty of gross or wanton negligence, as distinguished from ordinary negligence, in failing to seek medical care at the onset of the child's illness. And because it appeared that by the time the gravity of the child's illness became discernible, medical aid would probably have been ineffective, the Court said it was not established that the negligence of the parents, even if considered gross and wanton at this later time, was in fact the proximate cause of the death of the child.

Defenses to the charge of manslaughter for the failure to render necessary medical attention have generally been on three gounds: 1) as being contrary to religious belief; 2) by calling in a person other than an authorized physician; and 3) financial inability to provide the required attention.

As a general rule, as Professor Farinholt pointed out, religious belief is no defense to a prosecution for manslaughter where death results from want of medical attention on the part of the defendant who is under a legal duty to furnish it. These cases, however, nearly all involve the parental failure to provide medical care for children.

In some other cases, the defense has been made that an individual other than a legally licensed physician has been called in to attend. Although there is a division among the legal authorities, it seems to be the consensus that the calling in of one who has some knowledge of the curative art, or even the summoning of a Christian Science practitioner, is no legal defense to such a charge.

The financial inability to provide needed medical attention on the part of the person who was under a legal duty to provide such attention has often also been raised as a defense. Such financial inability to provide needed food, medicine, and medical care can be a defense, but only when the evidence shows that there are no public authorities available to whom application could be made for financial assistance. Again, nearly all of the reported cases in these areas involve the parent-child relationship.



We are all familiar with those statutes requiring vaccinations, physical examinations prior to the issuance of marriage licenses, and quarantine and isolation of those with communicable diseases dangerous to the public health.

The Baltimore City Code makes one guilty of a misdemeanor who refuses or neglects to be properly quarantined and isolated when suffering with a communicable disease or who, by reason of noncooperation or carelessness, endangers the public health. It is to be noted, however, that the City Ordinance does recognize, in this connection, religious beliefs: for it says that the provisions of the ordinance shall not be construed to interfere with bona fide practicing Christian Scientists or those who are under treatment from registered Christian Science practitioners.

Article 12, Section 209, of the City Code requires parents and guardians to have their children and wards vaccinated before they attain the age of one year and revaccinated whenever the Commissioner of Health requires it after five years from the last vaccination.

Article 43, Sections 70 and 73, of the Maryland Code make it unlawful for a medical practitioner to refuse to vaccinate any person or for any teacher in any public school to receive into such school a pupil who has not been vaccinated.

In 1952, the State of Washington upheld the validity of a regulation requiring students registering for admission to the state university to submit to a chest x-ray for tuberculosis. In *State ex rel. Holcumb* v. *Armstrong,* the court held that a regulation requiring such students registering for admission to the university, as applied to a Christian Scientist student, did not violate the guarantees of religious freedom contained in the state

METAHYDRIN (trichlormethiazide) is prescribed by physicians because it not only approximates the diuretic efficacy of parenteral meralluride injection . . . but, *it is the least expensive of all "brand-name" thiazides*. Therefore, when you prescribe METAHYDRIN (trichlormethiazide) your patients receive the thiazide diuretic that removes a little more salt and water than earlier thiazides, with relatively less loss of potassium . . . and, it's therapy they can more easily afford . . . *only pennies a day*.

METAHYDRIN®

(trichlormethiazide)

oral diuretic

Dosage: One 2 or 4 mg. tablet once or twice daily.

Precautions: As with all effective diuretics, vigorous therapy may produce electrolyte depletion. Patients with severely reduced renal function should be observed carefully since thiazides may be contraindicated. Care should be taken with patients predisposed to diabetes or gout. Patients with a tendency to potassium deficiency, as in hepatic cirrhosis or diarrheal syndromes, or those under therapy with digitalis, ACTH, or certain adrenal steroids, also should be watched carefully.

Side Effects: Nausea, flushing, constipation, skin rash, muscle cramps and gastric discomfort have occasionally been noted; rarely thrombocytopenia and bone marrow depression, photosensitivity, cholestatic jaundice, pancreatitis, perimacular edema, gout and diabetes have been caused by the administration of thiazides.

Contraindications: Complete renal shutdown; rising azotemia or development of hyperkalemia or acidosis in severe renal disease; demonstrated hypersensitivity.

How Supplied: Bottles of 100 and 1000 tablets.

and federal constitutions. The court said that while freedom of religious belief was absolute, freedom to act in pursuance of such religious beliefs must, in the nature of things, remain subject to regulation for the protection of society.

So again, as in the *Craig* case and the *Levinsky* case in Maryland, the court says: We recognize the absoluteness of the right to a religious belief, but we also recognize the limitation of a right to act based upon that religious belief.

Statutes setting up procedures for discovering and for treating sexual psychopaths, which require, obviously, as part of the procedure, physical and mental examinations of persons reasonably suspected of being so inflicted, have been sustained both in California and in Missouri on the grounds of attacks on various constitutional grounds.

The recent decisions of the courts have continued to recognize that the interests of the community in protecting the general health (this is under the Tenth Amendment to the Constitution) justifies some interference with the liberty of the citizens and attempts made to avoid compliance with reasonable regulations requiring physical examinations, on the grounds that such compulsory examinations violated constitutional rights and privileges, have generally been unsuccessful.

We have here in Maryland our own statute defining "defective delinquency" and ordering the commitment to Patuxent Institution of those who appear to fit the classification, for physical and mental examination, to determine whether or not they are defective delinquents.

Rule 420 of the "Maryland Rules of Procedure" provides:

> Whenever the mental or physical condition or the blood relationship of a party or of an agent or a person in the custody or under the legal control of a party, is material to any matter involved in any action, the court may, upon motion by any party and notice to all other parties, for good cause shown, order such party to submit to a mental or physical or blood examination by a physician or physicians or to produce for such examination his agent or to produce the person in his custody or legal control.

In paternity cases, under the provisions of Article 12, Section 20, of our Code, a defendant who denies paternity can obtain a court order requiring not only that he but the mother of the child and the child itself submit to a blood test to determine whether or not, from blood groupings, the defendant can be excluded from being the father of the child. The statute permits a reference to be made in the evidence that either the complainant or the child failed to submit to such blood test.

Article 16, Section 44, of the Maryland Code pertaining to "inebriates" permits any person to petition the court for leave to commit a habitual drunkard to a state institution for the medical treatment of drunkenness. The statute, however, provides that in any such petition for commitment it must set forth that the drunkard is willing and will agree to attend such institution and must in writing agree to take such treatment.

The provisions of law relating to the power to commit persons *non compos mentis* are familiar to all.

Now, with all this background, you are saying in your minds: So what?

There is presently pending, on application to the Supreme Court of the United States, a petition for the issuance of a Writ of Certiorari, the case of *Jessie E. Jones* v. the *President and Directors of Georgetown College, Inc.* This case involved an adult who, because of her religious belief, refused to permit a blood transfusion. This case meets, if you will, head on the question we now have before us this evening of whether or not the court has the power to intervene and order a blood transfusion for an adult who is opposed to such transfusions on religious grounds.

The facts: On September 17, 1963, Mrs. Jessie Jones, 25 years of age, a Negress and the mother of a seven-month-old child, awoke feeling extremely ill. Her husband took her by taxicab to Georgetown University Hospital; she had no personal physician and submitted herself solely to the responsibility of the hospital staff. Examination confirmed that she had lost two-thirds of her body's blood supply from a ruptured ulcer. Her hematocrit was tested in midafternoon at 14%. The doctors who attended her, as her condition worsened, were convinced that she would die unless she was given an emergency blood transfusion.

Both Mr. and Mrs. Jones were Jehovah's Witnesses. Their religion teaches that it is a sin "to consume blood," and they refused to permit the transfusion. The basis for their religious opposition to blood transfusion is that in receiving a transfusion, one is really eating blood. And they rely on two biblical passages: Genesis 9:2, where God told Noah, after the flood, "Every creeping animal that is alive may serve as food for you. As in the case of green vegetables, I do give it all

Metatensin lowers blood pressure and keeps it low—effectively and economically. It combines reserpine with trichlormethiazide which affords more potent saluresis with less loss of potassium than from earlier thiazides. Reserpine contributes antihypertensive effect by relieving anxiety and tension. Metatensin is well-tolerated over long periods; with its effectiveness and economy it assures antihypertensive therapy you and your patients can stay with.

BRING IT DOWN AND KEEP IT DOWN

METATENSIN®

Each scored tablet contains:
METAHYDRIN® (trichlormethiazide)
2 mg. or 4 mg. and
Reserpine 0.1 mg.

Usual adult dose: One tablet twice daily. **Precautions and side effects:** Patients with hepatic cirrhosis or diarrheal syndromes, or under therapy with digitalis, ACTH, or potassium-losing steroids, should be observed for signs of hypokalemia. With thiazides, electrolyte depletion, diabetes, gout, granulopenia, nausea, pancreatitis, cholestatic jaundice, flushing, mild muscle cramps, constipation, photosensitivity, acute myopia, perimacular edema, paresthesias, neonatal bone marrow depression in infants of mothers who received thiazides during pregnancy, skin rash or purpura with or without thrombocytopenia, may occur. With reserpine, untoward effects may include depression, peptic ulcer and bronchial asthma. Withdraw medication at least 7 days prior to electroshock therapy, 2 weeks prior to elective surgery.

Contraindications: Complete renal shutdown, rising azotemia or development of hyperkalemia or acidosis in severe renal disease.

Supplied: Metatensin tablets, 2 mg., 4 mg.—bottles of 100 and 1000.

to you. Only flesh with its soul—its blood—you must not eat"; again in Leviticus 17:10, God tells of the consequences of disobedience. "I shall certainly set my face against the soul that is eating the blood and I shall indeed cut him off from among his people."

When the hospital authorities could not prevail upon either Mrs. Jones or her husband to permit the transfusion, the attorney for the hospital made an application to the U.S. District Court for a court order permitting the transfusion. Judge Tamm, of the District Court, denied the application and refused to act. Counsel went immediately, about 4 PM that same day, to Judge J. Skelly Wright, of the U.S. Circuit Court of Appeals for the District of Columbia. The judge spoke by telephone with the attending physician and then went to the hospital.

Mr. Jones advised him that he would not approve the blood transfusion on religious grounds but that if he, the judge, ordered it, Mr. Jones's responsibilities, morally and religiously, were relieved.

The judge obtained permission of Mr. Jones to see his wife. Her appearance confirmed the urgency of the situation. The judge tried to communicate with her to advise her of what the doctors had said. Her only audible reply was, "Against my will." Judge Wright concluded that she was not in a mental condition to make a decision and, after additional efforts to persuade Mr. Jones to authorize the transfusion, pointing out to him that blood administered by transfusion was different from "drinking blood," even though Mr. Jones remained unmoved, the judge ordered the transfusion.

Mrs. Jones recovered. She acknowledges that the transfusion may have helped her, but she says, "No one knows the secret of life and death." She stated that even if it did help her, such action did not justify violating her religious beliefs.

On October 14, the patient filed a petition with the U. S. Circuit Court of Appeals for a rehearing and for an order setting aside the order signed by Judge Wright authorizing the transfusion. The nine judges of that Court refused to grant a rehearing—and nearly every one of them had a separate and different legal reason—and the application is now pending before the Supreme Court to review Judge Wright's action and the action of the Court of Appeals in denying a reopening of the case.

Judge Wright's opinion sums up the issue we have here and will help to give some of the legal thinking that went into the case. In his memorandum opinion, he stated that at the time the application was made to him, the court was familiar with similar cases respecting children but was unaware of any precise legal precedent for its action in connection with a 25-year-old adult. So this case is a case of, you might say, unprecedented action.

Judge Wright found, because of the demonstrated imminence of death from loss of blood, the order was necessary to maintain the *status quo* and to prevent the issue respecting the rights of the parties from becoming moot. He held that the case did not involve a person who for religious or other reasons had refused to seek medical advice; nor did it involve a disputed medical judgment or a dangerous or crippling operation. Nor did it involve the delicate question of saving a newborn in preference to saving the mother. Mrs. Jones had sought medical attention and had placed on the hospital the legal responsibility for her proper care. In its dilemma, not of its own making, the hospital sought judicial direction.

In his opinion, Judge Wright said:

> It has been firmly established that the courts can order compulsory medical treatment of children for any serious illness or injury and that adults, sick or well, can be required to compulsory treatment or prophylaxis for contagious diseases and that there are no religious exemptions from such orders.

This is the only area in which we have had precedence. He cited from the decision of the Supreme Court in *Prince* v. *Massachusetts*:

> . . . Acting to guard the general interest in youth's well being, the state as *parens patriae* may restrict the parents' control. . . . Its authority is not nullified merely because the parent grounds his claim to control the child's course of conduct on religion or conscience. Thus, he cannot claim freedom from compulsory vaccination for the child more than for himself on religious grounds. . . . The right to practice religion freely does not include liberty to expose the community or the child to communicable disease or the latter to ill health or death.

He further pointed out the decision of the Supreme Court in 1878 in *Reynolds* v. *U.S.*, that if a wife religiously believed that it was her duty to burn herself upon the funeral pyre of her husband, it was not beyond the power of the government to prevent her from carrying this belief into practice. He pointed out also the decision of the Supreme Court in 1905 in *Jacobson* v. *Massachusetts*, where the Court upheld the power

NORPRAMIN®

(desipramine hydrochloride)

non-sedating • rapid-acting
ANTIDEPRESSANT

overcomes guilt, lifts depression, restores confidence

Feelings of guilt, worthlessness, emptiness and loss frequently characterize depression. Such feelings, along with insomnia, physical complaints, sadness, apprehension, and other symptoms of depression rapidly respond to Norpramin (desipramine hydrochloride). Improvement often begins in 2-5 days, sometimes in less. A few patients, sensitive to central nervous system stimulants may become restless as depression is lifted—in such cases dosage may be reduced or a tranquilizer added.

Indications: In depression of any kind—neurotic and psychotic depressive reactions; manic-depressive or involutional psychotic reactions. **Dosage:** Optimal results are obtained at a dosage of two 25 mg. tablets t.i.d. (150 mg./day). **Contraindications and Precautions:** Glaucoma, urethral or ureteral spasm, recent myocardial infarction, severe coronary heart disease and epilepsy. Should not be given within two weeks of treatment with a monoamine oxidase inhibitor. Safety in human pregnancy has not been established. **Adverse Effects:** Side effects, usually mild may include: dry mouth, constipation, dizziness, palpitation, delayed urination, "bad taste," sensory illusion, tinnitus, agitation and stimulation, sweating, drowsiness, headache, orthostatic hypotension, flushing, nausea, cramps, weakness, blurred vision and mydriasis, rash, allergy, transient eosinophilia, granulopenia, altered liver function, ataxia and extrapyramidal signs. **Supplied:** Norpramin (desipramine hydrochloride) tablets of 25 mg., in bottles of 50, 500 and 1000.

of the state to subject adults, against their will, to be vaccinated.

In Judge Wright's opinion, he recognized that the facts involved neither a sick child nor a contagious disease but that the case was analogous to the sick children cases because Mrs. Jones was *in extremis* and was hardly *compos mentis*—that she was as little able competently to decide for herself as any child would be. He concluded that the Court had the responsibility of assuming guardianship for her, even though she was an adult, as it would be for a child, at least to the extent of authorizing treatment and, I quote from his opinion, "to save her life." By analogy, he found that since a parent has no power to forbid the saving of his child's life, *a fortiori* the husband of the patient had no right to order the doctors to treat his wife in a way that would cause her to die.

The state, as *parens patriae,* will not allow a patient to abandon a child, and so it should not allow this ultimate of voluntary abandonments in permitting her to die and, thus, abandon her seven-month-old child; just as she had a responsibility to the community to care for her infant, the people had an interest in preserving the life of the mother.

Judge Wright disposed of the argument submitted to him that an individual's liberty to control himself and his life extended even to the liberty to end his life by pointing out that self-homicide, suicide, was a crime, and that the refusal to have necessary medical aid could be construed as attempting suicide, the only difference being between misfeasance and nonfeasance.

Judge Wright, in part of his opinion, said:

> The Gordian knot of this suicide question may be cut by the simple fact that Mrs. Jones did not want to die. Her voluntary presence in the hospital as a patient seeking medical help testified to this. Death, to Mrs. Jones, was not a religiously commanded goal but an unwanted side effect of a religious scruple. There is no question here of interfering with one whose religious convictions counsel his death, like the Buddhist monks who set themselves afire. Nor are we faced with the question of whether the state should intervene to reweight the relative values of life and death after the individual has weighed them for himself and found life wanting. Mrs. Jones wanted to live.

The third set of considerations involving his decision related to the position of the doctors in the hospitals. She submitted herself to the hospital for treatment; they had no choice but to administer proper treatment or to let her die in a hospital bed and expose themselves and the hospital to both civil and criminal liability. He concluded that Mrs. Jones did not have the authority, when she submitted herself to the hospital for care, to place the hospital and its doctors in this impossible choice.

His opinion concluded:

> Neither the principle that life and liberty are inalienable rights nor the principle of liberty of religion provides an easy answer to the question whether the state can prevent martyrdom. Moreover, Mrs. Jones had no wish to be a martyr. And her religion merely prevented her consent to a transfusion. If the law undertook the responsibility of authorizing the transfusion without her consent, no problem would be raised with respect to her religious practice. Thus, the effect of the order was to preserve for Mrs. Jones the life she wanted without sacrifice of her religious beliefs.

It is to be emphasized that the decision of the court in ordering the transfusion was based on two main considerations, as I see it: the utter emergency of the problem and the fact that Mrs. Jones was not considered fully *compos mentis.*

Her attorneys have now asked the Supreme Court to review the case on two main constitutional grounds. I might point out to you, in connection with their petition, they have filed two exhibits with the Supreme Court. One is a copy of the magazine, *Awake,* with an article entitled "Does your Child Belong to the State?" Another article published there is: "My Years in Prison in Communist China"; and another exhibit is apparently a pamphlet of the Watchtower Bible and Tract Society, entitled *Blood, Medicine and the Law of God.* These are each filed as exhibits with the Supreme Court, and they are asking the Supreme Court to read these when they consider the legal questions involved.

Her attorneys, in asking the Supreme Court to review this position now, put this on *two* main constitutional grounds: 1) whether a free, adult citizen of the United States has had her constitutional rights violated by a denial to be let alone and her right to determine for herself what will be done to her own body by rejecting a particular form of medical treatment; and 2) whether the First Amendment to the Constitution is violated by forcing a citizen, against her will, to accept a form of medical treatment that is a violation of conscience and religion and whether the Federal Court has the authority to lend its aid in allowing such forced treatment.

Her counsel say in their brief:

> Freedoms of speech, press and religion are entitled

In colicky infants Pediatric Piptal with Phenobarbital slows down spasm, diminishes pain and crying and improves feeding patterns. It permits sleep and rest for patient and family. The less than hypnotic amount of phenobarbital in the recommended dose affords a mild, calming action and enhances the antispasmodic action of Piptal (pipenzolate bromide). The latter drug, as reported in the medical literature, has a favorable ratio of effectiveness to side-effects which is unusual in anticholinergics and thus is particularly appropriate to pediatric use.

PEDIATRIC PIPTAL® WITH PHENOBARBITAL

each cc. contains 6 mg. phenobarbital (warning: may be habit forming); 4 mg. Piptal® (pipenzolate bromide), and 20% alcohol.

Pleasant-tasting Pediatric Piptal with Phenobarbital is miscible in milk, formulas and fruit juices, and may also be given by dropper directly on the infant's tongue. Dosage is 0.5 cc. 15 minutes before feeding; in severe cases, 1.0 cc. four times daily. High doses may occasionally cause constipation with tenesmus and, rarely, flushing without fever. It is contraindicated in bowel obstruction or sensitivity to phenobarbital or anticholinergics. Available in 30 cc. dropper bottles, droppers calibrated to deliver 0.5 cc.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

LAKESIDE | PRODUCTS FOR PATIENTS YOU SEE EVERY DAY

to a preferred constitutional position because they are of the very essence of a scheme of ordered liberty. They are essential not only to the persons or groups directly concerned but to the entire community. Any interference with them is not only an abuse but an obstacle to the correction of other abuses.

They argue that the Constitution protects her constitutional rights to believe and to act in accordance with the dictates of her own conscience and that there is no power in law or anywhere else to interfere with this right. They point out that persons of Jewish faith abstain from pork; persons of the Roman Catholic faith abstain from meat on certain fast days; persons of Christian Scientist faith abstain from medical care; and the First Amendment protects the individual conscience in all such instances.

The appellants' attorneys, citing from a book published by W. B. Saunders in 1961, *Complications in Surgery and their Management,* and in particular a section entitled "Cumulative Mortality from Complications of Blood Transfusions," point out there are at least 16,500 deaths per year resulting from blood transfusions, according to this work, in pointing out the uncertainty of a good result at the time the court passed its order for the purpose of "saving the life of Mrs. Jones."

They cite further from volume 3 of the *Canadian Bar Journal,* an article entitled "Religion, Medicine and the Law," as authority for their argument that there is much controversy and difference of opinion with the medical profession as to the therapeutic value of blood transfusion.

Her attorneys conclude in their brief that no interest of the public was in any way threatened by Mrs. Jones' refusal to submit voluntarily to a blood transfusion.

In a press interview, Mrs. Jones acknowledged that the hardest question she has had to answer has been the question of responsibility to her infant son. When she was asked, "Didn't you feel an obligation to go on living for his sake, even if it meant a transfusion?" her reply was, "God takes care of the birds, and he clothes the lilies of the field. If he can take care of his inanimate creatures, he can take care of his people who are animate. God would protect him (her son). Besides, he couldn't grow up to be a Christian if I didn't remain one to the end myself."

I think that you may realize, from what both Professor Farinholt and I have discussed with you this evening, that the question of consent permeates the question of the power of the state to impose medical treatment and to order transfusions and immunization. In the case of minors, they are incapable legally of consenting for themselves, and the protection of the courts is invoked to have the court legally give its consent acting for and in behalf of the minor. Resort is also made to the court in order to satisfy the requirement that the hospital, physician, or surgeon is confronted with a genuine emergency.

Cases involving adults are not as easy to dispose of. You will note from Judge Wright's opinion that he found that Mrs. Jones was *in extremis,* thus satisfying the emergency requirement, and that she was legally incapable of giving her legal consent because she was not considered as being fully *compos mentis.*

There can be no difficulty, even with adults, in those areas involving the public health and safety, under the Tenth Amendment. The real difficulty arises in the cases of adults who, because of their personal religious beliefs, refuse to authorize an approved medical procedure.

We will have to await the decision of the Supreme Court as to whether or not the provisions of the First Amendment, freedom of religion, will control in such cases.

I personally doubt that the Supreme Court will agree to review Judge Wright's decision, because actually Mrs. Jones has had the transfusion, she has recovered, and there is no longer a genuine justiciable controversy. If the Supreme Court thus refuses to review the decision, Judge Wright's order becomes an effective precedent based upon the facts with which he was presented. The emphasis must be here made, Mrs. Jones was not fully *compos mentis* and there was a true finding of emergency.

It is questionable whether the doctrine of *parens patriae* could be invoked in the case of an adult whose condition did not present a clear danger to the other members of society unless the theory of the law in punishing self-homicide is made applicable to such cases, although the individual is thus permitting death by negative rather than by positive action.

I am sorry that we cannot give you the precise legal answer which you need and desire, but I trust that what we have said this evening has been thought-provoking and has emphasized for you the areas upon which concentration should be placed when you are confronted with such problems.

eczema: scourge of childhood

R. R., Age 11—Before treatment—atopic eczema of long standing

After treatment—with ARISTOCORT Topical Ointment 0.1% for two weeks

ARISTOCORT® Triamcinolone Acetonide Topicals have proved exceptionally effective in the control of various forms of childhood eczema: allergic, atopic, nummular, psoriatic, and mycotic.

In most cases responsive to topical ARISTOCORT, the 0.1% concentration is sufficiently potent. The 0.5% concentration provides enhanced topical activity for patients requiring additional potency for proper relief.

Administration and Dosage: Apply sparingly to the affected area 3 or 4 times daily. Some cases of psoriasis may be more effectively treated if the 0.1% Cream or Ointment is applied under an occlusive dressing.

Contraindications: Tuberculosis of the skin, herpes simplex, chicken pox and vaccinia.

Precautions and Side Effects: Do not use in the eyes or in the ear (if drum is perforated). A few individuals react unfavorably under certain conditions. If side effects are encountered, the drug should be discontinued and appropriate measures taken. Use on infected areas should be attended with caution and observation, bearing in mind the potential spreading of infection and the advisability of discontinuing therapy and/or initiating antibacterial measures. Generalized dermatological conditions may require systemic corticosteroid therapy. Steroid therapy, although responsible for remissions of dermatoses, especially of allergic origin cannot be expected to prevent recurrence. The use over extensive body areas, with or without occlusive nonpermeable dressings, may result in systemic absorption. Appropriate precautions should be taken. When occlusive nonpermeable dressings are used, miliaria, folliculitis and pyodermas will sometimes develop. Localized atrophy and striae have been reported with the use of steroids by the occlusive technique. When occlusive nonpermeable dressings are used, the physician should be aware of the hazards of suffocation and flammability. The safety of use on pregnant patients has not been firmly established. Thus, do not use in large amounts or for long periods of time on pregnant patients.

Packages: Tubes of 5 Gm. and 15 Gm.; ½ lb. jar.

History of the Baltimore City Hospitals

BY DOUGLAS CARROLL, M.D.

Chapter 6.—The Bayview Asylum: Some Socio-economic Influences (1866-1890)

Society's reaction to the mentally ill has oscillated throughout recorded history between brutality and benevolence. When neither was extreme, pernicious neglect was the rule.[1]

Practices at the Bayview Asylum

The move, in 1866, of the indigent from Calverton to the new three-storey building overlooking the Chesapeake Bay must have been a day of great rejoicing. A number of new rules were drawn up to improve admitting practices and the care of patients. The resident physician was to have control and direction of the medical and surgical treatment of all patients. A number of students were assigned to the various wards under the direction of the resident physician. Students were required to present histories and physical findings on each patient under their care and to keep careful medical records.

In 1871, pay patients were accepted in the institution. In the same year, some of the purchases were: arrowroot, 2,500 cigars, two pairs of handcuffs, medical journals at $25, surgical instruments at $30, 395 pounds of snuff, four dozen bottles of Worcestershire sauce, 957 pounds of tobacco, 75 gallons of whiskey.

The Insane

The crowding of the insane continued to be a problem. In 1879, the Trustees report, "Nothing but callus indifference can be attributed to those whose duty it is to remedy so great an evil." The State Legislature, no doubt, was the target of their barbs, for the Trustees' solution was to have the State of Maryland take responsibility for the insane.

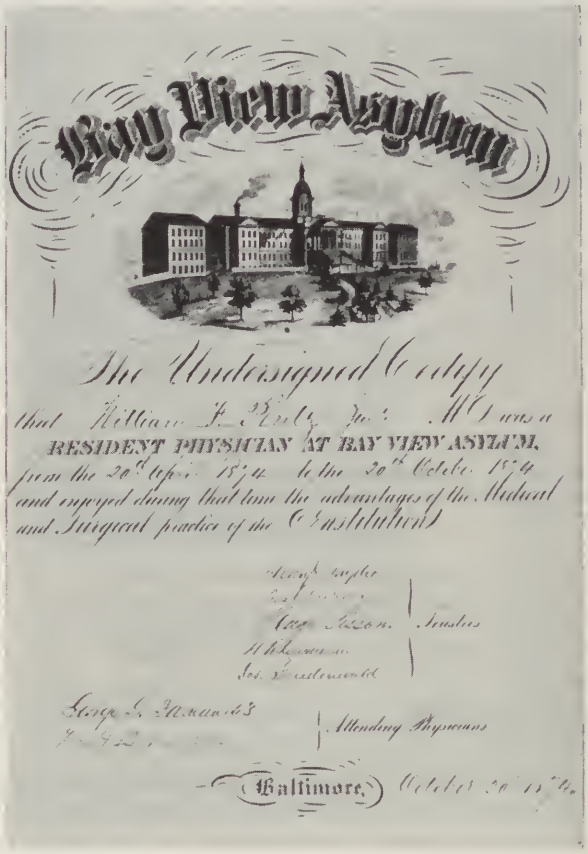
In 1884, a new insane hospital was complete but was scantily furnished with beds, chairs, and other necessities. In this year, two resident doctors were appointed, one recommended by each of the two medical schools (the University of Maryland and the College of Physicians and Surgeons). In 1886, staffing of the insane hospital became the responsibility of the Johns Hopkins University. By 1890, another hospital for the insane had been constructed.

Although the institution must have been overwhelmed with insane patients (it was at this time relieving the state insane asylums at Spring Grove and Mount Hope), the Trustees, in 1890, drew attention to the growing number of patients with chronic diseases. Nearly 80% of the inmates were permanent.

Student Teaching

Medical students had been taught at the Almshouse by professors from a variety of medical schools from around 1812. The quality of the teaching and medical care had varied with the skill and interest of the individual professors. Under Dr. Power, in the 1840's, the instruction and care had been well above average. But these professors had their own practice to attend to. They taught students for a fee or as volunteers. In the early 1890's, the development of the Johns Hopkins Medical School required the use of Bayview for pathological material and for the teach-

ing of psychiatry. The combined interest of the medical schools improved the care of patients.



Social Factors Influencing Admissions to the Almshouse

Over the ensuing years, it became more and more a pattern of the municipal courts to admit vagabonds and chronic alcoholics to the Almshouse for domiciliary care. In 1883, the Trustees drew attention to this problem, stating that although the tax payers of Baltimore were perfectly willing to provide for the unfortunate infirm and sick of Baltimore, they objected to providing for the "worthless and dissolute vagabonds" who came to the Almshouse, especially those from other cities. It was not until 1935 that the General Assembly of Maryland took from the magistrates the right to commit persons to the Baltimore City Hospitals unless they were sick. It was recognized at this time that the hospital was not the place for transient vagabonds and alcoholics who were merely without a night's lodging. Such admissions to the hospital in large numbers broke the morale of the staff and resulted in less time for care of the sick.

In 1888, the Trustees first mentioned the possibility that unemployment sometimes resulted from lack of jobs rather than from laziness. They noted that different individuals varied in mental and physical strength. "This, together with the social and moral surroundings, has the effect of making distinct classes." There was an increase in inmates of the Almshouse during this depression year, and the Trustees noted that the older people, the infirm, and those weakened by drink were the first to lose their jobs.

The moral stigma of poverty and unemployment were not lifted until the great depression of the 1930's. There were few, indeed, who were not involved in this major upheaval. It was only by becoming poor that many citizens were able to accept poverty not as a moral indictment but as a result of economic forces.

In 1888, the Trustees demonstrated a good deal of righteous indignation against the oyster industry, which shanghaied workers aboard oyster boats, kept them until they were sick, and then deposited them on shore without pay. In the report of 1888, the fact was clearly established that

Bay View Asylum Certificate 1874

The name of the Almshouse had been changed to Asylum, indicating its function as an insane asylum in addition to its other traditional functions. The building had been completed and opened for use eight years before (1866). This building was refurbished several times, but in 1959 it was completely gutted except for the walls. Five floors were built in the place of the previous three.

a great many of the people coming to the Almshouse came through no fault or failure on their own part.

Cultural and Social Movements Influencing Medical Care

The pattern of small community life was giving way to that of big city life, where contacts between neighbors were not as frequent or friendly, where factories were growing larger and larger, where the men of the family were working in competition in the mareket under employers they did not know personally. A large number of immigrants continued to come into the eastern cities.

William Graham Sumner (1840-1910), professor of political and social science at Yale University from 1872 to 1909, was one of the strongest voices of conservatism. He insisted that poverty was the result of vice and derided the democratic humanitarian ideas of the 18th and 19th centuries as empty speculation. He taught, "A law may be passed which shall force somebody to support the hopelessly degenerate members of a society, but such a law can only perpetuate the evil and entail it on future generations with new accumulations of distress." This philosophy provided a comfortable and supposedly scientific rationale for irresponsibility by the middle and upper classes already becoming more and more impersonal in their community involvement.

This point of view was supported by Herbert Spencer (1820-1930), who said, "Under the natural order of things, society is constantly excreting its unhealthy, imbecile, slow, vacillating, faithless members." The laissez-faire economic system after the Civil War resulted in the accumulation of tremendous fortunes largely through the exploitation of natural resources or through government favoritism.

Nevertheless, during this time, many forces were at work to improve the general medical condition of the community. Although many philanthropists were strongly opposed to any federal or public relief for the sick, they were strongly in favor of private charities to take care of the poor.[2]

The year 1866 marks the beginning of the influence of the public health movement in the United States.[3] Lemuel Shattuck's report in 1859 outlined the needs for public health in Massachusetts and suggested the establishment of state health departments.

In New York City, in 1864, a group of citizens supporting a reform city government uncovered such shocking mismanagement that the New York State Legislature set up a metropolitan board of health in 1866. This led to the development of a health department uninfluenced by patronage and with power to act effectively. This example led to the establishment of other state health departments; Maryland's was founded in 1874.

Other influences were at work. In the insane hospitals, ideas were developing which improved the care of all chronically ill. Dr. John S. Butler (1803-1890), superintendent of the Hartford Retreat in Connecticut, wrote "Curability of Insanity" in 1887. He pointed out the importance of hospital environment and of cheerful, sympathetic people in the care of psychiatric patients. He believed in individual interviews with patients as well as in group discussion. Dr. Butler was extremely interested in person-to-person contact between doctor and patient and attempted to keep the size of mental hospitals to a maximum of 200 patients. He was defeated in this attempt, and throughout this whole period, the individual care and treatment of patients was largely being lost in public institutions.[1]

Family social work had its beginnings in England in 1869 with the founding of an organization which became later the Charity Organization Society. In United States, Buffalo was the first city to have a society of this type in 1877.[4]

Lethargy and indifference characterized the post-Civil War era at the Almshouse. The major problem was the overcrowding of insane patients. No outstanding figure was associated with the Almshouse during this period, and no important advance in medical care is recorded.

mood elevation

Abbott
Anorectic
Program

DESOXYN® Gradumet® (methamphetamine hydrochloride)

Smooth appetite control plus mood elevation.

The obese patient on a diet often has to battle depression as well as overweight. Desoxyn Gradumet helps the dieter in both battles by elevating the mood while it curbs the appetite. Thanks to the Gradumet, medication is smoothly released all-day from a single oral dose.

If she can't take plain amphetamine, put her on DESBUTAL® Gradumet

Calms anxieties; controls compulsive eating.

Desbutal Gradumet provides 2 drugs in 2 tablet sections, combined back to back to form a single tablet. One section contains Desoxyn to curb the appetite and lift the mood; the other contains Nembutal® (pentobarbital) to calm the patient and counteract any excessive stimulation.

Both drugs are released in an effective dosage ratio throughout the day.

controlled release

Abbott
Anorectic
Program

Not all long-release vehicles are the same. Here is why the Gradumet is different and what it means for your overweight patients.

The release action is purely physical and relies on only one factor common to every patient: gastrointestinal fluid. There is no dependence on enteric coatings, enzymes, motility, or an "ideal" ion concentration in the gastrointestinal tract.

Your patients get a measured amount of medication, moment by moment, throughout the day.

They are not subjected to ups and downs of drug release . . . or to erratic release from patient to patient . . . or to erratic release in the same patient from day to day.

That's why the Gradumet provides controlled-release as well as long release.

Perhaps you saw the Gradumet model demonstration which shows that the release is entirely physical. When fluid is added, the drug in the outer ends of the channels dissolves. As fluid penetrates deeper into the channels, there is a continuous release of medication. The rate of release is rigidly controlled by the size and number of channels.

economy

Patients, in many cases, save enough to get five weeks of medication for the price of four, compared to other leading long-release anorectics.

CONTRAINDICATION: Desoxyn and Desbutal are contraindicated in patients taking a monoamine oxidase inhibitor.

PRECAUTIONS: Use with caution in patients with hypertension, cardiovascular disease, hyperthyroidism, old age, or those sensitive to sympathomimetic drugs or ephedrine and its derivatives. Careful supervision is advisable with maladjusted individuals.

ANNE ARUNDEL COUNTY

The Anne Arundel County Medical Society held its recent meetings at the Coachman Inn on Ritchie Highway. The past two meetings had been well attended, and interesting programs have been presented.

The following officers and committees have been appointed for the ensuing year: **H. Logan Holtgrewe, MD,** president; **J. Fred Hawkins, MD,** vice president; **Hilary O'Herlihy, MD,** secretary; **Raymond P. Srsic, MD,** treasurer. Elected to the Board of Directors: **Drs. O'Herlihy** (1966), **Leipold** (1966), **Perry** (1966), **Manuzak** (1966-67), **Ray Smith** (1966-67), and **William Williams** (1966-67).

Delegates to the Medical and Chirurgical Faculty are **Charles McDonald, MD** (1966), **Merton Waite, MD** (1966-67), and **Clayton Norton, MD** (1966-68). Their respective alternates are **George Settle, MD, Hubert Manuzak, MD,** and **Aris Allen, MD.** Representative on the Faculty's Policy and Planning Committee is **William Williams, MD,** and his alternate is **Julius Loebl, MD.**

At the January meeting, Mr. I. Robinson of the Social Security Administration in Baltimore spoke on the Medicare program. A long discussion followed. A number of questions were asked and discussed. It was an interesting and productive meeting.

In February the Executive Committee met and took care of its routine business. The March meeting was also held at the Coachman Inn. It was well attended. At this meeting Mr. Denwood Kelly, executive director of the Maryland Blue Shield, spoke on the proposed new prevailing fees program. At the conclusion of his excellent presentation the numerous questions stimulated a lively discussion.

The Executive Committee at its April meeting, discussed the prevailing fee schedule and blood banking. Plans for the annual banquet in June were brought up to date by the program chairman.

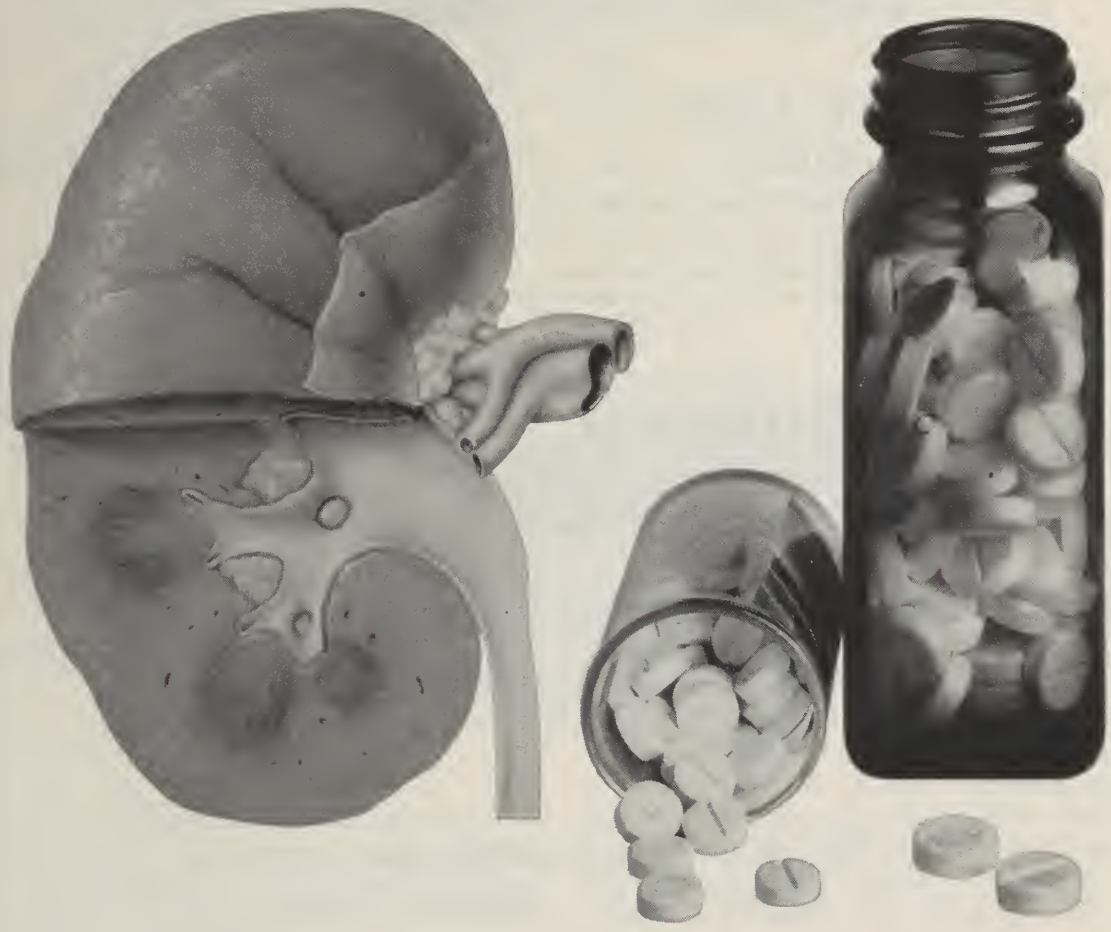
BALTIMORE CITY

At the April meeting of the Baltimore City Medical Society, a plaque was presented to **Herman Seidel, MD,** for his 54 years of exemplary service to the citizens of Baltimore City. A beautifully worded and heartfelt introduction was given by **Louis V. Blum, MD,** and a standing ovation was tendered Dr. Seidel as **Dr. Siwinski** presented the plaque.



A moment of silence was observed in memory of the following deceased members: **T. Nelson Carey, Nathan J. Davidov, Albert E. Goldstein, J. Mason Hundley, Mitchell S. Kunkowski, Milton Levin, Mason F. Lord, Irwin O. Ridgely,** and **William M. Rowland.**

The following applicants were elected to active membership: **Mary Ellen Avery, Martin J. Birnbaum, Richard Kalinowski, Paul A. Leap, Seymour Perlin, Richard L. Riley, Mary Shams Roberts, Melito M. Torres,** and **Joseph J. Wityk;** by transfer: **Jerrie Cherry, Robert A. Gaertner, John E. Gessner, Ferdinand G. Mainolfi, Morton M. Mower, Lawrence J. Pazourek, Carl B. Schleifer, Martin M. Schuster,** and **Donald A. Wolfel.**

The following were elected to associate membership: **Werner Beck, J. David Bohorquez, Banjamin A. deGuzman, Albert Folgueras, Young Choon Hong, Robert M. Ollodart, Rene Trujillo-Lopez;** by transfer: **Alberto J. Diaz.**

The resolutions coming before the House of Delegates at the coming annual meeting were reviewed. The Baltimore City Medical Society went on record as supporting resolution 1A/66, separating professional fees from hospital charges. The Society went on record as ap-

at Merck Sharp & Dohme...

understanding... precedes development

The development of chlorothiazide and probenecid were events of major importance, but perhaps even more important for the future was the Renal Research Program by which they were developed. When Merck Sharp & Dohme organized this program in 1943, it was expressing in action some of its basic beliefs about research:

- Many problems connected with renal structure and function were still undefined or unsolved. The Renal Research Program would begin its basic research in some of these problem areas.
- From knowledge thus acquired might come clues to the development of new therapeutic agents of significant value to the physician.

For example, the Renal Research Program put fifteen years into this search before chlorothiazide became available. But because these years had first led to a greater understanding of basic problems, the desired criteria for chlorothiazide existed before the drug was developed.

Along with other research teams at Merck Sharp & Dohme, the Renal Research Program continues to add new understanding of basic problems—understanding which will lead to important new therapeutic agents.

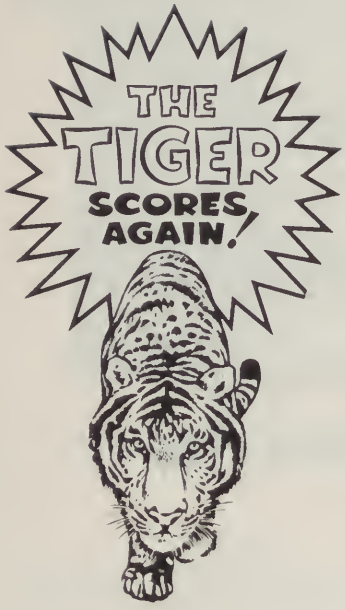
proving in principle Resolution 2A/66, requesting legislation for the creation of maintenance of the school of medical technology, but it opposed the method outlined in the resolution.

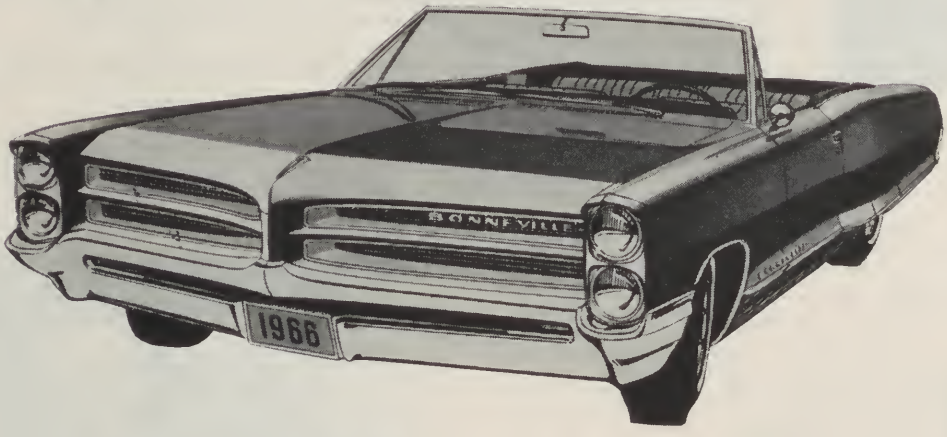
Dr. Middleton reported on the meeting on medical ethics of the American Medical Association, held recently in Chicago. **Dr. Morrison** moved that the President give a written report on the activities of the Executive Committee from time to time to the whole membership. The motion was carried. **Dr. Vash** moved that the Society have six monthly meetings from April to October to discuss pertinent current medical social and economic problems and welfare activities. The motion was carried.

Dr. De Hoff spoke regarding the Baltimore City Health Department's plan for the implementation of Title XIX of the Medicare Act. He pointed out that in the inner city there will be 200,000 citizens to be provided care under this provision after July, 1966. He called for interest and concern and active support of the Baltimore City Medical Society both in planning and implementing such plans for the care of these citizens.



* * * * *

At its April 12 meeting, the Executive Committee considered suggestions of possible donors for blood transfusions. The suggestions were contained in a report from the Maryland Society of Pathologists, prepared by its president, **Robert G. Lancaster, MD.**



A report was received from **Victor A. McKusick, MD,** of The Johns Hopkins University, advising that a study would be made of children in junior and senior high schools in the city to screen for sickle cell trait and other hemoglobinopathies.

The Committee accepted a proposal from Lederle Laboratories to distribute to Baltimore physicians a suggested form urging patients to obtain a single booster dose of oral polio vaccine.

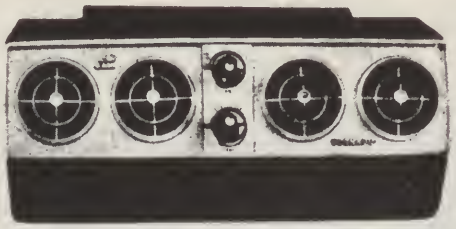
Thanks to Dexamyl®

brand of dextroamphetamine sulfate and amobarbital

she can say "No thank you" to the crêpes suzette.

'Dexamyl' does more than most anorectics. Because it curbs appetite *and* lifts mood, 'Dexamyl' can encourage the discouraged dieter to stay on her diet.

The mood lift with 'Dexamyl' can make the difference between the success or failure of her diet plan.



Formulas: Each 'Dexamyl' Spansule® Capsule (brand of sustained release capsule) No. 1 contains 10 mg. of Dexedrine® (brand of dextroamphetamine sulfate) and 1 gr. of amobarbital, derivative of barbituric acid [Warning, may be habit forming]. Each 'Dexamyl' *Spansule* capsule No. 2 contains 15 mg. of Dexedrine (brand of dextroamphetamine sulfate) and 1½ gr. of amobarbital [Warning, may be habit forming].

Principal cautions and side effects: Use with caution in patients hypersensitive to sympathomimetics or barbiturates and in coronary or cardiovascular disease or severe hypertension. Insomnia, excitability and increased motor activity are infrequent and ordinarily mild.

Before prescribing, see SK&F product Prescribing Information.

Ethical and Legal Aspects of Clinical Pathology Laboratories

PAUL F. GUERIN, MD

For many years, laboratories outside of the City of Baltimore have been required to "register" with the State Health Department. In 1965, the Baltimore City exception to this state law was deleted, by agreement with the City and State Health Departments. At the same time, the City Health Department laboratory became a branch of the state laboratory system. This meant that all laboratories throughout the state were required to meet the same standards.

During the 1966 session of the General Assembly, a joint resolution (which does not have the effect of law) was introduced and adopted, calling for a study of the "possibilities for licensing and regulating private medical laboratories in the state." The reasons given for the need of such a study were, among others, that most states have such licensing regulations, the increasing dependence of the medical profession on laboratory work, and reference to an article appearing in the October, 1965, *Reader's Digest,* called, "The Achilles Heel of the Medical Profession." This article was condensed from one appearing in *Redbook.*

In addition, two legislative bills were introduced. House Bill 675 was a State Department of Health bill and would establish by law that the State Health Department *shall* establish such minimum standards and qualifications for any laboratories in the state, *as it may consider necessary.* It also provided for periodic inspections and issuance of permits to such laboratories (italics ours).

Also introduced was House Bill 747 at the request of a newly-formed Maryland Association of Bioanalysts. It provided for a licensing board for "certain clinical chemistry or bioanalytical laboratories" and gave broad powers to this board. The composition of the board was to be: two members of the aforementioned association, one member nominated by the Medical and Chirurgical Faculty of Maryland, one from the American Chemical Society, and one from the State Board of Health. Requirements were established for the titles of laboratory director, laboratory bioanalyst, laboratory technician, and laboratory assistant. Each would have been required to take an examination, except that existing persons, depending on their experience, would have been issued a license upon payment of a fee, depending upon the category of the individual. The State Department of Health would have been charged with enforcement under this bill. Of special interest in this proposal was the failure to provide a category under which a physician might be a laboratory director. This bill died in committee, which means that it was not discussed at any length and no specific action on it was taken.

House Bill 675 was amended in both the House and the Senate. In its final form it provided that:

(1) If a laboratory director has been a director for at least seven years before June 1, 1966, he shall not be required to show further qualification.

(2) Any laboratory that has been operating for seven years or more will be issued a permit and will thereafter be required to comply with rules and regulations established by the State Health Department.

(3) A laboratory will not be required to have a physician director.

(4) No person, partnership, or corporation shall represent or service or maintain in this state any office, representative, or other facilities for the representation or servicing of any laboratories situated in this state or any other state which make examinations in connection with the diagnosis and control of human diseases, unless the laboratory so represented or serviced shall meet or exceed the minimum standards promulgated by the State Board of Health and Mental Hygiene under and pursuant to this section.

(5) No persons, partnership, association, or corporation shall within this state, either directly or indirectly, advertise or solicit business for any laboratory which makes examinations in connection with the diagnosis and control of human diseases if this laboratory is situated in this state or any other state.

The passage of this legislation will bring about several changes in medical practice which are desirable.

(1) Advertising, solicitation of work, and competition based on fees will no longer be legal.

(2) Out-of-state laboratories will not be permitted to solicit work by sending detail men or advertising material to the medical profession in Maryland generally.

(3) Laboratories out of Maryland performing work on Maryland patients will be required to meet the minimum standards required by the State Department of Health.

(4) All clinical laboratories not existing in clinicians offices for their patients will be required to meet minimum standards established by the State Department of Health.

The passage of this legislation will not affect the ethical principles in the conduct of clinical laboratories that have been previously established by the Medical and Chirurgical Faculty. The important provisions of these principles are as follows:

It shall be considered unethical:

(1) For a lay employee, directly or indirectly, to solicit work from physicians

(2) To advertise laboratory services in any media such as magazines, journals, newspapers, etc.

(3) To display any advertising material on vehicles

(4) To distribute mailing containers except on request

(5) To submit specimens to any laboratories not owned (except in licensed hospitals and governmental facilities), operated, and professionally adequately supervised by a licensed and registered physician

(6) To bill for laboratory services not performed by him or his regularly supervised employed assistants

(7) To send specimens to any laboratory rendering laboratory services at a flat fee (so-called contractual agreements)

(8) To share income from laboratory services directly or indirectly with any lay person

(9) To offer laboratory services under a fictitious name

(10) To offer laboratory services for the care of patients as a corporate structure

(11) To have a financial interest in any clinical laboratory where the physician is not personally and professionally responsible for the quality of the work performed in the laboratory

(12) To collect fees from any insurance company for laboratory services not performed by him or his regularly employed assistants

On June 17, 1965, the Council of the Medical and Chirurgical Faculty of Maryland adopted a report of the Laboratory Services Subcommittee of the Liaison Committee which stated in part:

> The Subcommittee feels that with the full cooperation of the Medical profession and others concerned, a program can be maintained in Maryland obviating the need for legislation to enforce rules which basically call for ethical conduct.

Unfortunately, this statement of policy has not been followed and additional legislation has been enacted, only some of which is good. In the final analysis, the responsibility for good laboratory work rests with the referring physician. If he will demand accurate and prompt service for his patients on a completely ethical basis, laboratories which offer less cannot survive. Furthermore, if this responsibility is exercised, additional legislative control should not be necessary.

The Science of Communication as practiced at Monumental Printing

It's more than a science: it's an Art, the precise transliteration in print of an intangible idea for a heterogeneous group of critical readers.

Here, at Monumental Printing, we learned to handle the tools of intelligent communication by the empirical method: working with them. The brush and palette of our art, the chisel, the score, the script are simply words on paper. We learned their proper use over 50 years of practice by being permitted to print such Journals as:

Clinical Chemistry
Digestive Diseases
Fertility & Sterility
Occupational Medicine
Leprosy
Mental Hospitals
Psychiatric Studies and Projects
Psychosomatic Medicine

We speak your language. We know the difference between edema and enema; syndrome and symptom; sewage and sewerage. And when and why we should use 12 point Caslon Bold instead of 10 point Stymie.

If you, too, need a good printer, let's communicate!

Joseph C. Fitzgerald, MD—*Editor*

A SERVICE OF
THE HEART ASSOCIATION OF MARYLAND

IDIOPATHIC MYOCARDIOPATHY

Part I: Clinical Features

GUSTAV C. VOIGT, MD
Fellow in Medicine

KENNETH B. LEWIS, MD
Chief, Cardiovascular Service, and Assistant Chief of Medicine, Baltimore City Hospitals

Idiopathic myocardiopathy is a nonvascular myocardial disease characterized clinically by heart failure with cardiomegaly and gallop rhythm and pathologically by diffuse patchy fibrosis and nonspecific inflammatory changes. It is a common disease.

Several investigators have found that idiopathic myocardiopathy is a significant cause of heart disease in adults. Harvey[5] found that it was responsible for more than 70% of the nonvascular myocardial disease in a large series of patients.

In the Baltimore area, we observed 40 patients with this disease during the past two years. In this article we will outline the clinical features of idiopathic myocardiopathy. Next month we will discuss the management of patients with this disease.

The cause of idiopathic myocardiopathy is unknown, but several thoughts are prevalent concerning its pathogenesis. A relationship to previous acute viral myocarditis, sometimes remote and often subclinical, has been suspected. Some patients have a history of alcoholism; but many do not, and the etiologic significance of alcohol is not clear. Woodward[9] and others have conducted experiments in animals, from which they infer that hyperimmune mechanisms may be important. Occasionally heart failure of obscure cause occurs in the postpartal period, but the roles of pre-existing myocarditis, hypertension, vascular myocardial disease due to toxemia, and pulmonary embolization are often not well defined in such cases, and it is doubtful that there is a specific myocardiopathy related to the puerperium.

Idiopathic myocardiopathy is more common in men, but the sex ratio is less striking if women who have heart failure of uncertain cause associated with pregnancy are included. Most patients are between 20 and 50 years old, although the disease has been reported in all age groups. The predominance of Negroes seems to reflect, at least in part, the populations studied, for many white patients with this disease are seen at centers which have a more racially-balanced patient population.

Most patients present with heart failure, cardiomegaly, and gallop rhythm. There are no distinctive clinical features, and many manifestations of idiopathic myocardiopathy suggest heart disease due to other causes, such as arteriosclerosis, hypertension, rheumatic fever, and constrictive pericarditis. The insidious onset of congestive heart failure in a patient who does not have

From the Departments of Medicine, The Johns Hopkins University School of Medicine and The Johns Hopkins Hospital and Baltimore City Hospitals.

a history of myocardial infarction or angina pectoris, and who does not have a predisposition to coronary artery disease, such as diabetes mellitus or hypercholesterolemia, suggests idiopathic myocardiopathy.

Although chest pain occasionally occurs in patients with idiopathic myocardiopathy, it usually *follows* the onset of heart failure. Patients with heart failure due to arteriosclerosis, on the other hand, most often have a history of angina pectoris or pain due to infarction *before* the appearance of heart failure.

Diastolic hypertension is common in patients with idiopathic myocardiopathy, particularly when heart failure is present, but it is usually associated with a narrow pulse pressure and indicates low cardiac output rather than hypertensive vascular disease. Murmurs of relative mitral or tricuspid insufficiency may occur, suggesting rheumatic heart disease, but these murmurs diminish in intensity or disappear when heart failure responds and cardiac size decreases. Murmurs due to rheumatic valvular disease become louder as the heart becomes compensated and cardiac output increases.

Some patients present with anasarca, hepatomegaly, and striking increase in venous pressure, suggesting cardiac tamponade due to pericardial effusion or constrictive pericarditis. A history of left ventricular failure preceding these signs of right ventricular failure favors myocardial rather than pericardial disease, but this is not absolute. Patients with idiopathic myocardiopathy may present with right ventricular failure. Pericardial scanning, carbon dioxide angiography, or diagnostic pericardiocentesis may be necessary to exclude constrictive pericardial disease with certainty.

The incidence of pulmonary and systemic emboli, the latter from mural thrombus in the left side of the heart, is high. We have seen an occasional patient present with cerebral embolization as the first manifestation of this disease. Arrhythmias, particularly atrial fibrillation and premature ventricular contractions, are frequent. Idiopathic myocardiopathy should be suspected whenever a patient presents with atrial fibrillation of obscure cause.

Laboratory findings are nonspecific. The chest x-ray practically always demonstrates cardiomegaly at some point in the patient's course. In addition to arrhythmias, non-specific ST-T wave changes, left ventricular hypertrophy, and bundle branch block are the most common electrocardiographic abnormalities. Myocardial biopsies reveal no pathognomonic changes, and such material is of little diagnostic or therapeutic value. We feel that myocardial biopsy is still an investigational tool only.

Mortality is high. Death occurs as a result of heart failure or its complications. Sudden and unexpected death is frequent, probably due to arrhythmias or embolization. Postmortem examination reveals cardiac hypertrophy, dilatation, diffuse patchy fibrosis, and nonspecific cellular infiltrates. Mural thrombi in the left and right sides of the heart are often seen, suggesting that at some point in the patient's course, myocardial and endocardial damage occurred, perhaps secondary to inflammation. Other findings are consistent with heart failure, and pulmonary and systemic infarctions may be found.

Problems of Diagnosis in Chronic Diseases, Part I

DOUGLAS CARROLL, MD
Chief of Physical Medicine and Rehabilitation
Baltimore City Hospitals

In an excellent survey of diseases in the elderly, Wilson, Lawson and Brass[1] were impressed by the multiplicity of diseases contributing to disability. It is apparent that correct diagnosis underlies successful rehabilitation and comprehensive management.

A review of a number of attempts to analyze the causes of diagnostic errors[2-4] shows two major situations associated with misdiagnosis. The first is an inadequate history. This situation arises particularly in elderly people who are living alone and are found comatose or confused. The second situation leading to diagnostic error is uncritical dependence on laboratory work, previous diagnoses, or obsolete physical examinations.

Another approach to improved diagnosis is to find those conditions most frequently missed and to keep these conditions at the forefront of attention in all cases. A number of books have been published[5-7] which are helpful in organizing symptoms and signs into diagnostic categories.

Our interest in the problems of diagnosis in patients with multiple diseases has been directed especially toward diseases which are treatable or curable. Over a number of years, we found that the treatable diseases, syndromes, or situations most likely to be mistaken fell into several groups:

I. Infections
II. Intra-abdominal abscesses, perforations, and gangrene of viscera amenable to surgical correction
III. Hemiplegia
IV. Endocrinopathies

Fevers and Infections

In elderly patients, in patients with chronic diseases, and in patients with lethal disease, particularly cancer, there are three situations in which treatable infections are common yet frequently missed in hospitalized patients.

Tuberculosis.—Tuberculosis is a disease almost universally present yet inactive in elderly people, hovering in the background, ready to flourish and spread if the patient's resistance is reduced by some other disease. In many situations, it is the tuberculosis rather than the initial underlying disease which causes the patient's death. Tuberculosis is to be sought particularly in patients with systemic lupus erythematosis, diabetes mellitus, sarcoid, pulmonic stenosis, chronic alcoholism, after major stomach resections, and in association with steroid treatment.

Hollister[8] found 22 patients with tuberculosis who came to autopsy in an acute hospital whose policy is not to admit patients with known tuberculosis. Fourteen patients had not been diagnosed clinically. Five of these had pulmonary tuberculosis, but the remainder had extrapulmonary tuberculosis making diagnosis difficult. Some reasons for misdiagnosis were lack of appreciation of the frequency of tuberculosis in elderly people, misinterpretation of x-rays, and failure to use all diagnostic aids.

Tuberculosis may present in unusual yet fairly

characteristic ways.[9] It is a frequent cause of unexplained fever.[10, 11] Hematogenous disseminated tuberculosis is the most frequently missed treatable infection in our experience.

Bacterial endocarditis.—Septicemia plays an important role in the pathogenesis of bacterial endocarditis, so that one should be particularly alert for its development with instrumentations of the genitourinary system, in pneumococcal pneumonia, neoplastic, and hematologic diseases.[12] Findings may be atypical in older people.[13]

The presentation of the disease may be in a joint, in the kidneys, brain, or other organs which draw attention away from the heart.

Infections in patients with cancer.—Browder, Huff, and Petersdorf have drawn attention to the occurrence of fever in patients with malignant disease.[14] Of 351 episodes of fever in 343 patients with malignant disease, they noted that infection or obstruction was the cause of the fever in 38%; 16% of the fevers were unrelated to the tumor, and they were able to attribute the fever to the cancer itself in only 5.4% of the cases. It is therefore important not to attribute fever occurring in a patient with malignant disease to the tumor, since the patient's life may be greatly prolonged if an unrelated infection can be identified and treated.

McCabe and Jackson[15] have documented the rapidly increasing incidence of bacteremia associated with other diseases in hospital practice.

Intra-abdominal Abscesses, Perforations and Gangrene

Where treatable conditions of the abdomen were missed, the clinical problem centered around making the decision to perform a laparotomy. Several situations seemed to recur repeatedly in obscuring the necessity for performing a laparotomy. The patient frequently could not give a good history, nor could he describe his abdominal symptoms at the time of examination. The second problem was the presence of another disease distracting attention from the abdomen as the point of immediate importance. A third difficulty was procrastination because the general medical condition of the patient was poor. A fourth difficulty was that many of the elderly patients did not present the usual signs of peritonitis.

One case of liver abscess was overlooked at laparotomy which included a liver biopsy. Another patient was repeatedly examined for suspected peritonitis and had bilateral lower quadrant paracenteses which yielded no pus. The patient was found at autopsy to have a purulent pancreatitis with peritonitis of the lesser omental sac.

One of the most frequent treatable abdominal emergencies repeatedly missed is perforation of an acute or chronic duodenal ulcer with peritonitis and death. Duodenal ulcers have been seen frequently in patients with Laennec's cirrhosis, in patients with cerebrovascular accidents and hemiplegia, in patients with neurological diseases, particularly with diseases of the spinal cord, in patients with respiratory acidosis secondary to pulmonary obstructive disease, and in patients with poliomyelitis requiring artificial ventilation because of respiratory paralysis.

Perforation of a gangrenous vermiform appendix in elderly patients or those with multiple chronic diseases has been common in our experience.[16]

Because of the high incidence of gall stones in elderly men and women, one might expect a high incidence of acute gall bladder disease with obstruction, gangrene and perforation.

An 81-year-old man had a diagnosis of acute cholecystitis made on admission to the hospital. Because of dehydration, septicemia (proteus mirabilis), and anuria, operation was delayed several days for hydration and treatment of infection. He died on the fifth hospital day and was found to have gall stones obstructing the ampulla of Vater, with an abscess of the gall bladder, pylophlebitis, and liver abscesses of several weeks' duration.

Morse and Deterling[17] point out that time spent in evaluating cardiac, pulmonary, and electrolyte conditions even in the most acutely ill elderly patient is well justified before operation. In the present case, it is apparent that emergency operation might have saved the patient's life.

Another rarer type of perforation does not occur within the abdomen but is so frequently associated with or mistaken for abdominal disease that it should be mentioned here. This is perforation of the esophagus often associated with hemorrhage and mediastinitis. Since its cause may be the act of vomiting, it frequently complicated some abdominal disorder.

Alcoholism SECTION

From the Subcommittee on Alcoholism of the Medical and Chirurgical Faculty of the State of Maryland

Management of Acute Alcohol Withdrawal Symptoms

JOSEPH F. CHAMBERS, MD

This report, an approach to the medical withdrawal of the acutely ill alcoholic, is based on experience with some 3,000 alcoholics over the past two years at the District of Columbia General Hospital, a 1,250-bed facility serving a population of almost one million people. The average number of alcoholics admitted is 1,500 per year, constituting over one-third of all admissions to the Department of Psychiatry.

The Alcoholic Unit, a 35-bed ward in the Department of Psychiatry, is sufficiently identified as a separate area to avoid the alcoholic's reluctance to associate his problem with anything "mental." Acceptance of the prob'em initially as having anything to do with a neurosis is impossible for most alcoholics because such a concept adds to their already unbearable feelings of inadequacy and inferiority. But in a group with the same illness the patient can identify and socialize with other alcoholics, relieving the feeling he has of being different, cast out, and alone.

The primary function of the Alcoholic Unit is the medical management of withdrawal symptoms of large numbers of alcohol addicts coming from several sources but chiefly from the Emergency Room at D. C. General Hospital. Patients are seen by the resident physician in Psychiatry and are admitted specifically because of the severity of their withdrawal symptoms. Grave medical and surgical problems are not admitted to Psychiatry, being treated in the medical and surgical divisions. However, medical problems are routinely admitted when the chief complaint is alcohol withdrawal. These Emergency Room admissions are sick patients, over half of them in or impending delirium tremens. Others have had convulsions prior to admission or have histories of seizures. Most of them have had previous, some repeated, admissions.

While chronic alcohol intoxication also results in change in the social, behavioral, and familial areas, for the physician the presenting changes are metabolic and clinical. Calorie wise, alcohol is a fuel, nothing more; it is void of vitamins, proteins, and minerals. When, as in the alcoholic, ethanol becomes a major source of fuel, protein, vitamin, and mineral deficiencies begin to appear. Since alcohol is also a diuretic, the alcoholic becomes dehydrated. Clinically, he is restless, tense, agitated, often depressed, guilty, and anxious. He demands symptomatic relief and obtains it with

more alcohol. Abrupt cessation of drinking in the alcoholic results in the development of a series of progressive symptoms whose severity is roughly proportional to the length and amount of drinking preceding withdrawal. Pharmacologically, ethyl alcohol is a central nervous system (CNS) depressant. The prolonged excessive use of this drug results in adaptive cellular metabolic changes seen clinically as withdrawal symptoms.

The patient shows signs of CNS involvement by agitation, confusion, and tremulousness. He may be dizzy and ataxic. Further addiction is seen in the development of delirium, hallucinations, and even convulsions. The ever-present possibility of head injury in the acute alcoholic must be remembered; head injury may be masked by the withdrawal.

The cardiovascular system shows tachycardia, premature ventricular contractions, and other arrhythmias. There is substantial systolic and moderate diastolic hypertension. The patient has hemoconcentration from his dehydration. Leukocytosis and variable fever are usually present.

Gastrointestinal symptoms are prominent, varying from anorexia and mild malaise to nausea, vomiting, and diarrhea. The patient may have modest hepatic congestion or be moribund with florid cirrhosis, ascites, and jaundice.

The shaking alcoholic who is in or impending on delirium tremens is anxious, frightened, terrified, often beyond our comprehension. These patients can be suicidal. They often convulse and behave in a bizarre psychotic fashion. At this point, and well before it, they are valid medical and psychiatric emergencies.

The medical treatment of acute alcohol withdrawal is directed primarily to the correction of the disturbed physiology. This involves sedation, correction of fluid balance, and vitamin, mineral, and protein replacement.

Drug Therapy

The use of tranquilizing drugs has brought about a vast change in treatment. Chlordiazepoxide hydrochloride (Librium), currently the drug of choice, produces greater muscular relaxation than other agents, less drowsiness, and less hypotension.[1] A recently recognized and important property of the drug is its anticonvulsant effect. This is of particular importance in the treatment of alcoholics where withdrawal convulsions are a grave and occasionally fatal complication. The effect of chlordiazepoxide on the blood pressure seems to be cumulative after large doses. There is no sudden initial reaction; this is an advantage over the phenothiazines. (Our experience at D. C. General Hospital with chlordiazepoxide,[2] chlorpromazine, and trifluoperazine[3-5] have been published elsewhere).

The agitated alcoholic is treated as soon as he is seen. Many factors influence initial drug dosage: agitation, tremulosity, delirium, convulsions, age, muscle mass, the presence of intoxication, and the degree of dehydration and fever.

Chlordiazepoxide is given 50 to 200mg intramuscularly on admission. This is repeated one to six times in the first 36 hours depending upon the degree of agitation and delirium. Significant relief of even the severe cases occurs within 36 hours. High dosages are continued until this substantial relief takes place. At this point, medication is sharply decreased and changed to the oral route: 25 to 50mg three times a day for two to four days. The patient is drug-free one to two days prior to discharge.

Chloral hydrate, 1.0 to 1.5Gm, is used for bedtime sedation, and with chlordiazepoxide, usually provides restful sleep from which the patient is readily aroused. We no longer use barbiturates for bedtime sedation; as sedatives for alcoholics they are effective, yet frequently produce intoxication instead of hypnosis, and are also lethal drugs with addiction liabilities.[6] We do not use paraldehyde: its odor is offensive, its margin of safety inferior, and its addictive properties widely known.

Grand mal seizures seen in alcohol withdrawal states have been aptly called "alcolepsy." Formerly diphenylhydantoin and phenobarbital were routinely given to all patients with a history or an actual episode of convulsions; but since the advent of chlordiazepoxide, withdrawal seizures are rare at D. C. General Hospital. Diphenylhydantoin is still used, prior to and after discharge where there has been an actual seizure, and phenobarbital in the acute convulsive crisis to insure control.

Fluid, Food, Rest

Correction of the fluid imbalance has not been found to be a problem in the large majority of cases. With tranquilizers, it is quite possible to hydrate orally. Fluids are available and encouraged, and are forced on the sicker patients. Less than 10% have been found to require intravenous

fluid therapy. The patient is given an ample nourishing diet, with milk and fruit juices between meals, and rests for two hours after the noon meal and for nine hours at night. The alcoholic in the throes of a drinking bout does not eat nor does he really rest; the sleep he catches is fitful and of short duration, and the importance of rest and food in his recovery has long been recognized.

Vitamin replacement therapy is accomplished by either oral (multivitamin capsules) or parenteral administration. With the sicker alcoholic, where there is evidence of weight loss, cirrhosis, and delirium tremens, intramuscular B-complex and C vitamins are given daily until discharge. Antispasmodics are used frequently. Chlordiazepoxide seems to have an autonomic quieting effect by itself in most cases. Others require anticholinergics and gels to obtain relief from the discomfort caused by gastritis and low-grade peptic ulcers.

A major advantage of hospital treatment of the alcoholic lies in the substantial advances in nursing skills. Good clinical judgment by experienced and interested personnel is vital, since signs pointing to impending convulsions or relapse into delirium tremens can be recognized if they are known and looked for knowledgeably.

In some toxic long-term alcoholics, the acute brain syndrome does not clear in three to four days. They pass from the acute, agitated, delirious stage to an intermediate period of confusion and disorientation marked by severe memory loss. These patients rapidly show signs of sedation with medication. Treatment here involves reduction or discontinuance of medication. Only that necessary to control agitation and insure sleep is used. Fluids, parenteral vitamins, and vigorous nursing care generally resolve this intermediate phase within 10 to 20 days. These patients are peculiarly prone to bronchopneumonia and may have some liver damage, but will do surprisingly well with good nursing care and close medical supervision. Many recover rapidly; for others, complete recovery may take many months; some do not improve at all, remaining confused and disoriented with permanent organic damage. These unimproved patients are committed to St. Elizabeth's, the Federal Mental Hospital for the District of Columbia.

Therapy in the Home

Treatment of acute alcoholic withdrawal outside the hospital involves several problems not encountered in the controlled hospital setting. Intoxication, family strife, abuse of medication—one or all may confuse the treatment picture.

However, alcohol withdrawal often can be managed in the home. In many localities it has to be handled there, since general hospitals refuse to admit on this diagnosis alone. This refusal stems partly from the mistaken idea that alcoholics are unmanageable. The Alcohol Unit at D. C. General Hospital is the quietest, cleanest unit in Psychiatry. With an average census of 30 patients, not more than two are in restraints at any one time, and these two are usually quiet. The fairly sober, sick alcoholic who wants to get well is an eminently manageable patient.

Treatment in the home is quite possible provided certain ground rules are followed. Patients, when seen, should be sober or nearly so, and they must be interested in treatment. (It is pointless to make a housecall at the family's request on a still drinking alcoholic who has a case of whiskey and is maudlin-drunk). The patient should be willing to attempt to follow a prescribed course of treatment. If at all possible, an interested family member should be the nurse, supervising the patient, giving him his medication, encouraging and providing fluids and later food.

Often, after the first day or two of treatment, someone from the local Alcoholics Anonymous (AA) group may help out here. However, AA is interested only if the patient is interested. It behooves the physician treating alcoholics to have some understanding of AA and to have contacts with these fine people.

Maternal Welfare

Instructive case histories submitted by Subcommittee on Maternal Welfare

JOHN WHITRIDGE, JR., MD, chairman

Case 13—Rupture of Uterus

The patient was 41 years old, para 7, with seven living children. All of her previous pregnancies had been essentially uncomplicated. The birth weight of the infants ranged from 6 lb 1 oz to 7 lb 14 oz. Her prenatal course in the present pregnancy had been uncomplicated. She had made six prenatal visits. Total weight gain had been 23 pounds, and the blood pressure had remained normal. The latest hemoglobin reported during pregnancy was 11.8gm.

On August 15, the patient went into labor spontaneously and was admitted to the hospital at 8:30 PM. Admission physical examination revealed the cervix 3cm dilated, with the vertex presenting and membranes intact. Contractions were occurring every 15-20 minutes, lasting approximately 30 seconds.

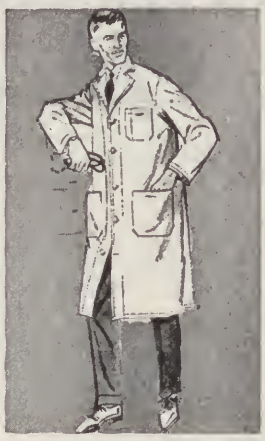
Three hours after admission, at 11:30 PM, contractions had diminished in frequency and intensity, and an intravenous pitocin drip with 5 units of pitocin in 1000cc of 5% glucose was begun. After four hours of pitocin stimulation, the cervix was fully dilated, and shortly thereafter the presening part was visible. Ethylene anesthesia was given, and a full-term living girl weighing 6 lb 12 oz was delivered spontaneously at 4 AM. Two minutes afterward, the placenta was expressed by the Crede method. One ampoule each of intravenous pitocin and intramuscular ergonovine was given immediately after delivery of the placenta.

Shortly thereafter it was noted that the patient was bleeding rather freely. Anesthesia was resumed, and the vagina and cervix were examined for lacerations and the uterine cavity was explored. No lacerations were found, nor were fragments of placental tissue discovered. Blood was sent to the laboratory for typing and cross-matching. A pitocin drip was reinstituted, and the excessive bleeding subsided. The patient was in mild shock, blood pressure not stated, and a plasma expander was begun until whole blood arrived. At 4:50, the administration of 1000cc whole blood was begun, and the patient's blood pressure rose to normal. Three hours later she was returned to her room.

At 10:15 AM, the uterus was found to be relaxed and boggy, and about 200cc of blood was expressed from the uterus and vagina. Blood pressure was recorded as being 60/0. An additional two units of whole blood were begun, together with vasopressers and pitocin, with little change in the patient's condition. Two more units of whole blood were administered, making a total of 3000cc. In spite of this, the patient remained in shock and was pronounced dead at 3:50 PM, August 16, approximately 12 hours postpartum.

Postmortem examination revealed an incomplete rupture of the uterus, 3cm in length, in the left lateral wall of the lower uterine segment, with extravasation of blood into the left broad ligament. There was no free blood found in the peritoneal cavity.

Comment



The committee voted this a preventable maternal death for two reasons. The first criti-

cism concerned the use of pitocin stimulation in a para 7. It is generally agreed that pitocin stimulation in patients of high parity is unduly hazardous and should be avoided.

A second preventable factor was the failure to detect the laceration in the wall of the uterus. Had a more careful examination been carried out and the rupture diagnosed, prompt hysterectomy probably would have altered the outcome.

Blueprint for dealing with tension due to stress — Prolixin — once-a-day

For the patient who must be on the job mentally as well as physically, prescribe Prolixin. The prolonged tranquilizing action of as little as one or two mg. helps him cope with tension all day long. Markedly low in toxicity and virtually free from usual sedative effects, Prolixin is effective in controlling both anxiety associated with somatic disorders and anxiety due to environmental or emotional stress. Patient acceptance is good — because Prolixin is low in cost, low in dosage and low in sedative activity. Prescribe Prolixin.

Side Effects, Precautions, Contraindications: As used for anxiety and tension, side effects are unlikely. Reversible extrapyramidal reactions may develop occasionally. In higher doses for psychotic disorders, patients may experience excessive drowsiness, visual blurring, dizziness, insomnia (rare), allergic skin reactions, nausea, anorexia, salivation, edema, perspiration, dry mouth, polyuria, hypotension. Jaundice has been exceedingly rare. Photosensitivity has not been reported. Blood dyscrasias occur with phenothiazines; routine blood counts are recommended. If symptoms of upper respiratory infection occur, discontinue the drug and institute appropriate treatment. Do not use epinephrine for hypotension which may appear in patients on large doses undergoing surgery. Effects of atropine may be potentiated. Do not use with high doses of hypnotics or in patients with subcortical brain damage. Use cautiously in convulsive disorders. **Available:** 1 mg. tablets. Bottles of 50 and 500. For full information, see Product Brief.

Diagnosis and Treatment of Streptococcal Pharyngitis

KARL H. WEAVER, MD

Approximately 1-3% of persons who have an untreated type A, beta hemolytic streptococcal infection (hereafter referred to as *streptococcal infection*) will develop acute rheumatic fever. This initial attack of acute rheumatic fever can be prevented if the streptococcal infection is accurately diagnosed and adequately treated. The highest incidence of rheumatic fever is between the ages of about 5-16 years with the peak at about 8-10 years. It is the physician who cares for children who has the best opportunity to prevent this potentially crippling and disabling and even fatal disease.

The typical signs and symptoms of streptococcal pharyngitis are sudden onset of fever and sore throat. The child appears ill and has tender cervical adenopathy. The pharynx and tonsils have a beefy red injection, and usually an exudate is present. Unfortunately, many persons who have streptococcal pharyngitis do not exhibit these signs and symptoms; some who do may have a pharyngitis of viral etiology. Coxsackie or an adenovirus pharyngitis may be manifest by an exudate. Using clinical criteria alone, streptococcal pharyngitis can be diagnosed accurately in only 50-70% of cases.

Laboratory aids, notably throat culture, are most important. Only by using this simple and inexpensive technique can streptococcal pharyngitis be identified accurately, allowing proper treatment to be instituted and rheumatic fever prevented. This technique of throat culture, plating and incubation of the culture, and recognition of beta hemolytic streptococcal colonies are well described in a publication of the American Heart Association entitled *A Method for Culturing Beta Hemolytic Streptococci From the Throat.* This concise pamphlet can be obtained from your local Heart Association chapter. It is imperative that any suspected streptococcal pharyngitis be confirmed by culture. The technique should become a routine office procedure.

Once a diagnosis of a streptococcal infection has been made, treatment must be adequate to prevent rheumatic fever. Whatever antibiotic is used, it must be given for a full 10 days. Penicillin is clearly the drug of choice, and erythromycin second. Tetracyclines are unreliable because of resistant streptococcal strains. Sulfonamide preparations have no value in the treatment of streptococcal infections.

It is important for therapy to be continued for 10 days even though clinical improvement may occur in a much shorter time. Intramuscular penicillin is probably the best form of therapy, since it prevents the patient from discontinuing the antibiotic after several days (which frequently happens with oral therapy) because of the relief from symptoms. A single injection of 1.2 million units of benzathine penicillin (600,000-900,000 units in a child) is adequate. This preparation may cause a somewhat painful local reaction. Also, 600,000 units of penicillin in oil

From the Department of Pediatrics, University of Maryland School of Medicine.

with aluminum monostearate intramuscularly every third day for three doses is adequate. It is impractical to use aqueous penicillin. A single dose of procaine penicillin is inadequate.

If oral penicillin is used, a total daily dose of 800,000 to 1.2 million units divided into four doses should be given. If potassium penicillin G is used, it should be given on an empty stomach to allow maximal absorption.

For those patients who are sensitive to penicillin, erythromycin is the drug of choice. It should be given in the dosage of 125-250mg four times a day for 10 days. Tetracyclines should not be used unless it is known that the infecting organism is sensitive to that antibiotic.

In summary, rheumatic fever is a preventable sequela if the preceding streptococcal infection is accurately diagnosed and adequately treated. Throat culture is vital to accurate diagnosis. Adequate treatment consists of an adequate blood level of the appropriate antibiotic (penicillin clearly being the drug of choice) for a full 10 days.

YOU CAN'T ARGUE WITH 90 YEARS EXPERIENCE IN FITTING INFANTS' AND CHILDREN'S SHOES!

- Parents feel happier when their children are in the hands of Hahn's specially trained personnel.
- All children's fittings are double checked by the Hahn's store manager.
